*"Double" Income Tax.*—The rapid increase of taxation both in the United Kingdom and in the British Overseas Dominions brought into new prominence a grievance which, though long felt to be annoying and inequitable, had not hitherto been a very severe hardship. It arose from the fact that, owing to the income tax being imposed in the United Kingdom on all the income of a British resident irrespective of the country of its origin, income which arose in a Dominion and was taxed there was again taxed in this country in the hands of the resident recipient. With high rates of tax in both countries this hardship was suddenly and enormously magnified, and in 1916 an attempt was made to deal with it. Where the same income was assessed both in the United Kingdom and in a British possession relief was to be granted (as a maximum) so as to bring the United Kingdom rate charged on that income down to 3s. 6d. As the rate in force was then 5s. in the £, the maximum relief was 1s. 6d. When the rate was increased to 6s. in 1918 this provision was still continued, the effect being to increase the maximum relief to 2s. 6d. in the pound. The relief was granted at the expense of the British Exchequer. This attempt to remedy the double income tax grievance was admittedly only a temporary expedient, made without prejudice to the ultimate settlement between the Exchequers concerned, and it was coupled with an undertaking that the whole matter should be fully gone into after the war.

*Non-deduction at Source.*—The war was responsible also for a striking departure from the great principle of deduction of tax "at the source," which since 1803 has been the characteristic feature of the collection of the tax. The necessity for attracting foreign money led to the issue early in 1917 of the 5% War Loan, 1929–47, subject to the condition that the interest on the loan should be paid in full without deduction of tax. Recipients of interest who were ordinarily resident in the United Kingdom were to be liable to direct assessment on the interest, but the interest paid to holders who were not ordinarily resident in the United Kingdom was altogether exempt from tax. The same course was followed in some other war issues, but the Treasury reverted after the war to the old method.

*Farmers.*—The rise in the price of commodities consequent upon the war drew attention to the income tax position of farmers. Under Schedule B of the Income Tax Acts, farmers had always been assessed not upon their actual ascertained profits but upon a conventional amount based on the rent or annual value of their farms. From 1896 to 1915 the Schedule B assessment, intended to represent the profit of the occupation of land, was fixed at one-third of the rent. Under war conditions this position rapidly became so favourable to the farmers that a change had to be made. In 1915 the Schedule B assessment for farmers was fixed at the full rent instead of one-third of the rent, and in 1918 it was raised to twice the rent. Seeing, however, that a farmer can always elect to be assessed under Schedule D on his actual average profits, and can, moreover, have his Schedule B assessment adjusted if his profits prove to be less than the conventional basis of twice his rent, he is still in a favoured position in spite of the six-fold increase in his Schedule B basis.

*The Royal Commission, 1919.*—Even before the war there had been many evidences of a desire for a general and searching inquiry into the income tax. Its administrative machinery was very old, and parts of it were in practice obsolete; the main features of the tax dated from a time when the conditions of business life were widely different from modern conditions; and the law on the subject could only be collected piecemeal and with much labour from half a hundred statutes. The Government had before the war promised to appoint a commission with full powers of inquiry, and this commission was on the point of being set up when war began. Postponement was inevitable. But in the meantime a very salutary work was undertaken by way of preliminary. This was the task of consolidating the existing income tax law into one comprehensive statute, a step very necessary to be taken before any thorough survey of the income tax position could be made by a commission consisting in the main of laymen.

As the result of much labour, first on the part of a departmental committee and then of a joint select committee of the House of Lords and the House of Commons, the Income Tax Act, 1918, was passed on Aug. 8 1918, with effect as from April 6 1919. It did not alter the law. It was merely a consolidating measure. The fact that the whole of 13 Acts and parts of 39 others were repealed by the 1918 Act is sufficient proof that the time was ripe for consolidation.

The long-expected and long-promised inquiry into the tax came within a few months of the cesssation of hostilities. A Royal Commission of 23 members, under the chairmanship of Lord Colwyn, was appointed by Royal Warrant dated April 4 1919. The terms of reference were widely drawn:—"To inquire into the income tax (including super-tax) of the United Kingdom in all its aspects, including the scope, rates and incidence of the tax; allowances and reliefs; administration, assessment, appeal and collection; and prevention of evasion; and to report what alterations of law and practice are necessary or desirable and what effect they would have on rates of tax, if it were necessary to maintain the total yield." The Royal Commission held 50 sessions, examined 187 witnesses (including 21 official witnesses), and issued a long and comprehensive report (Cmd. 615) on March 11 1920. They also published in two volumes a verbatim report of the minutes of evidence, running to 1,383 pages, and a further volume containing 71 appendices to the minutes of evidence, and an index to the whole. These three volumes contain an enormous mass of information on the subject and are indispensable to the serious student. Among the appendices are a short history of the tax, an exposition of the existing income tax system, historical memoranda on various aspects of the tax, notes on the position in the Dominions and foreign countries, and much interesting statistical information.

The report, which was signed by all the commissioners—the reservations being few and comparatively unimportant—ranged over the whole field of the tax. There was no minority report.

The recommendations of the Royal Commission were very numerous, detailed and far-reaching; only the more important need be summarized here.

In Part I. of the report, dealing with "the scope of the tax," they recommended that certain classes of non-recurring or "casual" profits, which are now outside the charging words of Schedule D, should be made assessable (paragraph 91); and that British subjects residing abroad should no longer be deprived of the allowances and reliefs granted to residents (paragraph 65). They also proposed a modification of the relief in respect of "double income tax." On this question of "double taxation within the Empire" a sub-committee of the Royal Commission had conferred with representatives of the Dominions and of India who had come to this country for the purpose, and the report of that sub-committee was accepted by the whole commission. The principle underlying their recommendation was that where income tax is charged on the same income both in the United Kingdom and in a Dominion the total relief to be given should be equivalent to the tax at the lower of the two rates of tax imposed. The recommendation was in the following terms:—

"Firstly, that in respect of income taxed both in the United Kingdom and in a Dominion, in substitution for the existing partial reliefs there should be deducted from the appropriate rate of the United Kingdom income tax (including super-tax) the whole of the rate of the Dominion income tax charged in respect of the same income, subject to the limitation that in no case should the maximum rate of relief given by the United Kingdom exceed one-half of the rate of the United Kingdom income tax (including super-tax) to which the individual taxpayer might be liable; and

"Secondly, that any further relief necessary in order to confer on the taxpayer relief amounting in all to the lower of the two taxes (United Kingdom and Dominion), should be given by the Dominion concerned." (Paragraph 70.)

In Parts II. and III., which dealt with "Rates and Incidence of the Tax," and "Allowances and Reliefs," an entirely new system of differentiation and graduation was proposed. Differentiation in favour of earned income, instead of being effected by a special series of rates of tax, was to be made by deducting one-tenth of the earned income (paragraph 111), in order to arrive at the "assessable income"—a new term—subject to a maximum deduction of £200. The old system of graduation by means of a series of abatements was to be superseded by a new plan. From the "assessable income" various personal and other allowances were to be made—for the taxpayer himself, his wife, children and dependants—and the balance was to be called the "taxable income." The first £225 of this "taxable income" was to be charged at half the standard rate, and the remainder at the full rate (paragraph 139). Further graduation in the higher ranges of income was to be by way of super-tax on the old lines. The new "personal allowance" was to be £135 for the unmarried taxpayer and £225 for the married couple (equal to £150 and £250 respectively in terms of "earned" income). This, in effect, was a raising of the old "exemption limit" and a considerable increase in the "wife allowance," but the new "personal allowances" were to be given to all taxpayers, without regard to the amount of their total income. The allowances in respect of children and other dependants were also to be allowed irrespective of the size of the taxpayer's income—a notable change (paragraph 270). The incomes of husband and wife were still to be aggregated for income tax purposes (paragraph 260); the spouses were to be allowed (as before) to make separate returns and to pay tax separately if they wished, but this was not to alter the total amount to be paid, which was still to be fixed by reference to the amount of the combined incomes.

The effect of this new system of graduation was to produce a smooth and gradual rise in the effective rate of tax as the income increased. The old line of graduation proceeded by a series of steps, the rise in some parts of the scale being much steeper than in others; the new plan (as shown by the graphs appended to the report) produced a line which rose smoothly and evenly instead of by a succession of jerks.

The commissioners expressed their strong conviction that the principle of "taxation at the source," a principle which underlies the whole scheme of the income tax in this country, must on no account be abandoned (paragraph 154). They recommended an allowance, subject to a good many qualifications, for certain wasting assets (paragraph 200).

When they came to deal with the administrative machinery of the tax, in Part IV. of the report, the Royal Commission had much to say that was of interest. The machinery provisions in the Act of 1842, when Peel reimposed the tax, were taken from the Act of 1806, which in its turn followed earlier models, and, as the commission said, looked back for its origin to the old Subsidy Acts (paragraph 331).

However well adapted to the social and commercial conditions of 1806 those provisions may have been, it was inevitable that they should be found wanting when examined in 1920. The Royal Commission found that the smooth working by the machine was "rendered possible only by considerable deviations from the scheme of administration originally conceived by the founders of the tax" (paragraph 331), and that "an attempt by the General Commissioners to carry out the Income Tax Acts literally would result in a breakdown of the machinery" (paragraph 342). They found that the position in the scheme originally allotted to the Crown's representative (the inspector of taxes) had gradually grown in importance with the development of the tax, and they reported that "without this gradual devolution to the inspector the machinery of the tax would have been found to be hopelessly inadequate" (paragraph 331). Most of their recommendations on this aspect of their subject were, as they themselves stated, "directed towards recognizing and giving legal sanction to those practical developments in the working of the tax which have so largely contributed to its success." They include (*a*) the abolition of the office of assessor (paragraph 386), (*b*) the transfer of certain clerical work from the clerk to the local commissioners to the inspector (paragraph 369), (*c*) the granting to the inspector of the power to make assessments in certain cases. The fundamental feature of the existing system—the right of the taxpayer to appeal against any assessment to the general commissioners, a local and unpaid body—was approved by the Royal Commission, but they made various suggestions as to the personnel and the tenure of office both of those commissioners and of the additional commissioners (another local unpaid body by whom assessments under Schedule D are made).

Part V. dealt with "assessment, appeal and collection" and covered a great variety of subjects. Among other things the commission proposed a rearrangement of the contents of the five categories or "schedules" into which incomes are divided for income tax purposes. Certain properties (such as railways, mines, gasworks, docks, etc.) were to be transferred from Schedule A to Schedule D which is the schedule under which profits of trade are charged; farmers' profits were to be transferred from Schedule B to Schedule D; and all incomes from employments were to be assessed under Schedule E which now includes certain classes of employments only. To the new Schedule D as so reconstituted a new basis of assessment was to be applied. The existing basis for Schedule D assessments is, generally speaking, the average of the profits of the three preceding years; but some classes of income are assessed under Schedule D on other bases. The incomes proposed to be transferred to Schedule D are also assessed on a variety of bases. The Royal Commission recommended that all this assortment of bases should be swept away, and that all the incomes to be assessed under the newly constituted Schedule D should be charged on the one uniform basis of the income of the preceding year.

Recommendations were also made with regard to the income tax liability of co-operative societies, but to these proposals there were several reservations (printed at the end of the report) on the part of some of the commissioners.

Part VI. was confined to the question of evasion of the tax and to the suggestion of possible preventive measures. The commission

were satisfied that a good deal of evasion existed and they made many proposals for dealing with it, mainly in the direction of giving the assessing authorities more power to call for accounts and information from the taxpayer, including (with certain safeguards) the power to have access to original books of account.

*Growth of the Tax.*—The accompanying tables will give some idea of the growth of the tax from the year 1911–2 onwards. In drawing inferences from the figures given it is always necessary to bear in mind not only the alterations in the rate of tax but also the effect of the various legislative changes made during the years in question.

INCOME TAX (Excluding Supertax).

| | Actual income liable to Tax before deduction of personal or family allowances and reliefs | Income on which Tax was received | Net produce of Tax | Normal rate of Tax | Produce of each penny of the normal rate of Tax |
|---|---|---|---|---|---|
| | Million £ | Million £ | Million £ | s. d. | £ |
| 1911–2 | 866 | 720 | 39 | 1 2 | 2,830,830 |
| 1912–3 | 907 | 755 | 41 | 1 2 | 2,969,591 |
| 1913–4 | 951 | 791 | 43 | 1 2 | 3,108,810 |
| 1914–5 | 985 | 814 | 63 | 1 8 | 3,169,614 |
| 1915–6 | 1050 | 873 | 118 | 3 0 | 3,299,034 |
| 1916–7 | 1373 | 981 | 201 | 5 0 | 3,360,612 |
| 1917–8 | 1631 | 1083 | 220 | 5 0 | 3,668,133 |
| 1918–9 | 2072 | 1287 | 303 | 6 0 | 4,217,088 |
| 1919–2 | Not available | Not available | 330* | 6 0 | 4,580,000* |
| 1920–1 | do. | do. | 350* | 6 0 | 4,860,000* |

* These figures are only estimates. For 1921–2 the estimated produce of each penny was £5,000,000.

SUPER-TAX

Amount of assessments, and number of persons charged, years 1911–2 to 1916–7; estimated income, yield, and numbers of persons chargeable for 1917–8, 1918–9 and 1919–20.

| | Total income (including the first portion of income on which no super-tax is payable) | Yield of the super-tax | Number of persons chargeable | Incomes chargeable |
|---|---|---|---|---|
| | Million £ | £ | | |
| 1911–2 | 150 | 2,842,177 | 12,253 | exceeding £5,000 |
| 1912–3 | 158 | 2,995,877 | 12,887 | do. |
| 1913–4 | 176 | 3,349,757 | 13,937 | do. |
| 1914–5 | 242 | 11,253,473 | 29,996 | exceeding £3000 |
| 1915–6 | 231 | 19,621,262 | 29,299 | do. |
| 1916–7 | 261 | 21,697,019 | 31,985 | do. |
| 1917–8 | 296 | 25,500,000 | 35,250 | do. |
| 1918–9 | 350 | 40,000,000 | 48,000 | exceeding £2,500 |
| 1919–20 | 410 | 46,000,000 | 56,000 | do. |

For 1920–1 and 1921–2 super-tax was charged on incomes exceeding £2,000; the estimated Exchequer receipt for 1920–1 was £55,281,000, and the number of persons chargeable was estimated at 81,000.

In the Finance Act of 1920 effect was given to some of the recommendations of the Royal Commission. Their suggestions were so numerous that they could only be carried into law by instalments, and the Finance Act, 1920, represented the first instalment. The new plan of differentiation, graduation and allowances was adopted in its entirety, and the relief proposed for double taxation within the Empire was also passed into law. At the same time the super-tax limit was brought down so as to include all incomes exceeding £2,000, and the super-tax rates increased, in close conformity with the suggestions of the commission.

A further instalment of the recommendations, dealing with the basis for assessment under Schedule D and with the machinery of administration, were embodied in a Revenue bill which was introduced in 1921 but was dropped for the session.

The Finance bill of 1921 contained no important income tax changes. The standard rate for 1921 remained at 6s. in the £, and the super-tax rates, on successive slices of income, were as they were fixed in 1920, viz:—

| | s. d. |
|---|---|
| On the first £2,000 of the income | Nil |
| " next £ 500 (to £2,500) | 1 6 |
| " " £ 500 (to £3,000) | 2 0 |
| " " £1,000 (to £4,000) | 2 6 |
| " " £1,000 (to £5,000) | 3 0 |
| " " £1,000 (to £6,000) | 3 6 |
| " " £1,000 (to £7,000) | 4 0 |
| " " £1,000 (to £8,000) | 4 6 |
| " " £12,000 (to £20,000) | 5 0 |
| " " £10,000 (to £30,000) | 5 6 |
| " remainder (above £30,000) | 6 0 |

The effective rates of income tax (combined with super-tax) on selected incomes are shown in the following table:—

| Actual total Income | Single Persons | | Married Couples without children | | Married Couples entitled to allowance for 3 children | |
|---|---|---|---|---|---|---|
| | If Income all "Earned" Income | If Income all "Investment" Income | If Income all "Earned" Income | If Income all "Investment" Income | If Income all "Earned" Income | If Income all "Investment" Income |
| £ | s. d. | s. d. | s. d. | s. d. | s. d. | s. d. |
| 200 | 8 | 11½ | Nil | Nil | Nil | Nil |
| 300 | 1 4 | 1 8 | 5½ | 9 | Nil | Nil |
| 400 | 1 8 | 2 3½ | 1 0 | 1 4 | 4 | 7½ |
| 600 | 2 11 | 3 6½ | 2 0½ | 2 7½ | 1 1½ | 1 8½ |
| 800 | 3 6½ | 4 1½ | 2 10½ | 3 5½ | 2 2½ | 2 9½ |
| 1,000 | 3 11 | 4 6 | 3 4½ | 3 11½ | 2 10 | 3 5 |
| 2,000 | 4 8 | 5 3 | 4 4½ | 5 0 | 4 1½ | 4 8½ |
| 3,000 | 5 8 | 6 1 | 5 6 | 5 11 | 5 4 | 5 9 |
| 4,000 | 6 5 | 6 8 | 6 3 | 6 7 | 6 1 | 6 5 |
| 5,000 | 6 11 | 7 2 | 6 10 | 7 1 | 6 8 | 6 11 |
| 6,000 | 7 4 | 7 7 | 7 3 | 7 5 | 7 2 | 7 4 |
| 8,000 | 8 1 | 8 3 | 8 0 | 8 2 | 7 11 | 8 1 |
| 10,000 | 8 8 | 8 9 | 8 7 | 8 9 | 8 7 | 8 8 |
| 25,000 | 10 2 | 10 3 | 10 2 | 10 2 | 10 1 | 10 2 |
| 50,000 | 11 0 | 11 1 | 11 0 | 11 1 | 11 0 | 11 0 |
| 100,000 | 11 6 | 11 6 | 11 6 | 11 6 | 11 6 | 11 6 |

On incomes above £100,000 the effective rate continued to progress, approximating to 12s. in the £ on the highest incomes.

## II. UNITED STATES

Although taxes on gains and profits derived from personal ability as distinguished from property—the so-called "faculty taxes"—were employed in the American colonies before the middle of the 17th century, no successful use of the general income tax was made in the United States until the Civil War; and the income taxes then adopted were soon thereafter repealed or fell into practical disuse. The demand for effective income taxation, however, showed great vitality. It kept moribund income-tax laws on the statute books in several states, led to abortive experiment with the tax, particularly in the "forties" and "nineties," and finally in 1909 resulted in the adoption of a Federal excise tax "with respect to the carrying on or doing business" by corporations, equivalent to 1% of the annual net income over and above $5,000. This proved to be in substance an effective income tax.

In 1911 (after the adoption of an empowering amendment to its constitution in 1908), the state of Wisconsin passed a general income-tax law applicable to individuals, partnerships and corporations; and the practical success of this tax encouraged other states to adopt similar laws or to vitalize the administration of unsuccessful income taxes already on the statute books. The following states now use the modern income tax:—Wisconsin, Massachusetts, Connecticut (corporations only), New York, Oklahoma (personal incomes only), West Virginia (corporations only), Missouri, Virginia, Delaware (personal incomes only), North Dakota, North Carolina, and Montana (corporations only). On Feb. 25 1913 the foundation for the Federal system of income taxation was laid by the ratification of the Sixteenth Amendment, which provided as follows:—

FEDERAL INCOME TAX

| | 1913 | 1916 | 1917 | 1918 | 1919 |
|---|---|---|---|---|---|
| *Personal Income Tax.* | | | | | |
| Total number of returns | 357,598 | 437,036 | 3,472,890 | 4,425,114 | 5,332,760 |

*Estimated.

The Congress shall have power to lay and collect taxes on incomes, from whatever source derived, without apportionment among the several states, and without regard to any census or enumeration.

The development of the Federal income tax in the Acts of Aug. 5 1909, Oct. 3 1913, Sept. 8 1916, Oct. 3 1917, and Feb. 24 1919, is suggested statistically in the appended tabular statement.

The most important characteristic of the Federal income tax is its striking productivity, the elasticity of which is illustrated by the increase of the Federal taxes based on income from $345,191,844 for 1916 to $2,921,583,203 for 1917 and to $4,286,486,257 for 1918. These enormous sums (now collected from taxpayers in four quarterly instalments each year) have been raised without causing bankruptcy or widespread distress to taxpayers. As appears in the table, the personal exemptions granted by the Federal law are high compared with the similar exemptions allowed in other countries, and only a small proportion of the population is directly affected by the tax. A large proportion of the tax is collected in the industrial or urban states, and is thus marked by some unfortunate class and sectional characteristics. Compared with the similar taxes of other countries, the rates on small and moderate incomes are low: while the rates on the larger incomes are comparatively high, probably the highest collected in any important country.

From the technical standpoint, the striking characteristics of the Federal tax are: its taxation of gains from the occasional sale of capital assets (the constitutionality of which was affirmed March 28 1921 by the U. S. Supreme Court in *Merchants' Loan and Trust Co.* v. *Smietanka*); its failure, largely because of constitutional limitations, to reach interest on municipal bonds and other tax-free securities; the relatively small and decreasing use of " stoppage-at-source " (whereby the normal tax is withheld and paid direct to the Government by payers out of the payments due to corresponding payees); the full credit accorded for income and profits taxes paid to any foreign country on income derived from sources therein; the complexity of the law arising largely from the " cushions " or relief provisions (such as the deduction for amortization and the allowance for depletion on the basis of discovery value in the case of mines and oil wells discovered by the taxpayer) designed to protect the taxpayer against hardship; the great centralization in the administration of the tax; and the delay in the audit and inspection of the larger and more important returns due principally to the complexity of the law and the centralization of the administration. The structure of the tax creates some difficulties. Individuals pay a " split-normal " tax of 4 and 8% (see table) and surtaxes rising from 1 to 65%, while corporations pay 10% (on income in excess of the specific exemption of $2,000), and excess profits tax. This plan is unsatisfactory and the excess profits tax, it was believed, would be repealed at the close of 1921. The other principal defects of the tax—the excessive rates of surtax; the demoralizing influence of tax-exempt income; the complexity of the tax; the delay in audit; and the over-centralization of administration—were generally acknowledged even by the friends of the tax, and legislative efforts to correct these failings were (1921) being made.

In the states, the adoption of income taxes was hastened by the unsatisfactory operation of the personal property tax, particularly on intangible personal property, and the so-called corporation franchise taxes. The income tax is being used (1921) to replace these taxes. The newer state income taxes are generally administered by state or central authority. There is an increasing tendency to compute the tax on the basis of the Federal return, and an effort is made by apportionment devices to exempt, in whole or in part, business or corporation income derived from property located and business transacted without the state. Jurisdictional questions and multiple taxation thus constitute fundamental problems. The Wisconsin tax is progressive on both individuals and corporations, rising (with surtaxes for soldiers' and educational bonus) to 13·2% on individual incomes in excess of $12,000 and on corporation incomes in excess of $7,000. The Massachusetts tax varies in rate for different classes of income, being 1½% on annuities and income from salaries and trade or business, 3% on the excess of gains over losses sustained from the purchase and sale of securities and intangible personal property, and 6½% on interest and dividends. The corporation tax in Massachusetts is at the rate of 2½%. In New York the personal

tax rises from 1 % on income not exceeding $10,000 to 3 % on income in excess of $50,000, and the corporation tax is at the rate of 4½ %. While the rates at which the state taxes are imposed are thus not immoderate, they create when added to the Federal tax a serious burden. The newer state laws, while centrally administered, provide for the return of a substantial portion of the tax to the county or local governments.

(T. S. A.)

**INDIA** (*see* 14.375).—The sixth decennial census of India (British India and the native states) was taken on March 18 1921. The provisional figures gave a total pop. of 319,075,132, of which 247,138,396 is the pop. of British India and 71,936,736 that of the native states. The corresponding figures of the decennial census of 1911 were: British India 243,933,178 and native states 71,223,218. The rate of increase in the decade ending 1921 is thus only 1·2%, a notable drop in comparison with the advance of the pop. in the immediately preceding decade, but nearly identical with the results of the 1901 census. The growth of the Indian pop. in the last 40 years had been singularly uneven. The percentages of increase in the several decennial periods were as follow:—9·6% in 1881–91; 1·4% in 1891–1901; 6·4% in 1901–11; 1·2% in 1911–21.

*Vital Conditions.*—These remarkable variations are, as might be expected, mainly due to the character of the agricultural seasons and the absence or presence of great epidemics of disease. The decade of 1881–91 was one of recovery from the great drought which devastated the Madras and Bombay Presidencies in 1876–8. The seasons were generally good and food was cheap and abundant. The next decade (1891–1901) was marked by one of the worst visitations of drought and famine, extending over the years 1896 and 1897, that India has known. It affected a population of nearly 70 millions, and was especially intense in the United Provinces, Bihar, the Central Provinces, Madras and Bombay. In the spring of 1897 4,000,000 people were receiving relief and the mortality, despite the efforts of the State to alleviate distress, was great. In 1896 bubonic plague appeared in Bombay, to which port it had probably been brought by infected rats in grain ships from China, and from thence it spread in an epidemic form into nearly every part of India. Under the ravages of plague and famine the population actually decreased in the decade in several provinces and native states, and the rate of advance for the whole of India was only 1·4%. In the next decade (1901–11) conditions were better. But a serious failure of the monsoon rains occurred in Upper India in 1908, and many parts of the country were devastated by plague. The growth of the population was curiously uneven in the different provinces and native states. The Central Provinces and Berar recorded an increase of 18%, the native states attached to those provinces an increase of nearly 30%, and the important state of Hyderabad one of 20%. These high figures represent the filling-up of famine losses in some of the less populous regions of India. In the more thickly populated provinces of Madras, Bombay and Bengal the increase ranged from 5% to 8%, while in the United Provinces and the Punjab the pop. actually declined. The very moderate rate of increase (6·4% in the decade) returned for India as a whole represented the mean of widely different provincial rates and concealed the recuperative power which the Indian population exhibited in those parts of the country where conditions were favourable.

The decade 1911–21 showed the lowest figure of increase since the decennial census was instituted in 1871. Up to 1917 the seasons were normally good and the public health not unsatisfactory. Notwithstanding the World War and its economic effect in raising prices and restricting the supply of necessary imports, the country was generally prosperous. A comparison of the yearly birth-rates with the corresponding death-rates showed an increasing population. But in 1918 a double calamity befell India. The monsoon rains failed over the greater part of the country. The losses of crops were estimated at 20 million tons or one-fourth of the average production. Food grains, milk and other nourishing food were at famine prices. The Government met the situation by importing wheat from Australia and rice from Burma, by a rigorous control over existing food stocks and by various relief measures. But distress was general and acute. On the top of this disaster a virulent form of influenza spread throughout India. Within the space of four or five months the epidemic was responsible for five million deaths in British India and a million in native states. The death rate of 1918 in British India exceeded 62 per mille or nearly double the birth-rate, as against a normal death-rate of about 30 per mille. In several provinces it was markedly higher. The United Provinces returned a death-rate of 83 per mille, the Punjab 88 per mille and the Bombay Presidency 93 per mille. Thus the decade which had opened prosperously closed on a people impoverished by scarcity and decimated by disease. The facts are reflected in the census returns.

Several provinces and a number of native states show an actual decrease of population. The pop. declined 2·6% in the United Provinces of Agra and Oudh, 1·6% in Bombay, 1·4% in Bihar and Orissa. The pop. of the United Provinces in 1921 was actually less by several millions than it was in 1891. The conditions of life in this densely populated tract give cause for anxiety. In the Central Provinces and Berar, which in 1901–11 had shown an increase of 18%, the pop. was practically stationary. The important state of Hyderabad, in which the pop. had increased by 20% in 1901–11, recorded a loss of 6·9% and the Rajputana states a loss of 6·4%. To this depressing record a few favoured tracts are exceptions. The pop. of the Travancore state, in the extreme south of the peninsula, increased by nearly 17%, and this on the top of an increase of 16% in the preceding decade. The pop. of Burma, a province which is happily exempt from the droughts and epidemics that afflict the Indian continent and in which the standard of living is considerably higher, continues to expand. In 1901–11 it increased by 15·5%, and in 1911–21 by 9%.

In brief, India is prodigal of human life and prodigal of death to a degree unknown in Western countries. The population nearly everywhere presses close on the limits of bare subsistence. It is largely dependent on the chances of the harvests and the vicissitudes of the seasons. It is peculiarly helpless by reason of its ignorance of natural laws and adherence to hurtful traditions and observances: and it is an easy victim of many diseases which science elsewhere has extirpated or set bounds to. A persistently high birth-rate is constantly kept in check or even nullified by an excessive death-rate. A stationary population is not in itself an evil. But in India it is attained by a profuse expenditure of human life and at the cost of much suffering and misery. In the sphere of social and sanitary reform an immense task and a great opportunity lie before the reformed governments of India.

The statistics of education, occupations, religions and castes were not available for the decade 1911–21 up to Aug. 1921. The census of 1911 had shown that the reforming sect of the Arya Somaj in Northern India grew from 92,419 to 243,514; Sikhs increased from 2,155,339 to 3,014,466; and Christians from 2,923,241 to 3,876,196.

## POLITICAL HISTORY, 1910–21

*The Morley-Minto Era.*—Nov. 1910 saw the close of the Morley-Minto era. Lord Minto then completed the fifth year of his viceroyalty and was succeeded by Lord Hardinge of Penshurst. About the same time Lord Morley exchanged the India Office for the less exacting duties of Lord President of the Council. His successor was the Marquess of Crewe. Many circumstances combined to make the period the opening of a new chapter in the political development of India. The advent of the Radical party to power in England in the autumn of 1905 quickened ambitions and aspirations for a larger measure of self-government that had been steadily gathering force among Indian politicians. They believed that Parliament, as constituted by the result of the recent general election, would not be indifferent to Indian grievances. In Lord Morley they saw the veteran champion of Liberalism and expected much of him. His position was difficult. He refused to undo the "partition" of Bengal. He recognized the difficulties of the Indian Government, but was convinced that a moderate measure of political advance was overdue. He was accused by some of having "shelved the principles of a lifetime," and by others of undermining the foundations of British rule in India. In the considered judgment of the Montagu-Chelmsford report the reforms he effected "constituted a real and important advance." They were "essentially of an evolutionary character"—a natural extension of the previously existing system, a change of degree and not of kind. Lord Morley, in his *Recollections* (1917), has given us interesting glimpses of his relations with the Viceroy, Lord Minto. Though widely different in temperament, training and political outlook, they appear to have worked together in essential harmony.

Lord Minto testified that on large questions of policy they rarely differed, though he thought that at times the Secretary of State interfered unnecessarily with the Indian Government in matters of actual administration, and reduced its authority to that of a mere agent. Lord Morley, undoubtedly, held and acted on the view that the executive in India is a derivative government, responsible not only as to policy but as to administrative acts to Parliament, and as such subordinate in all respects to the Secretary of State. The doctrine was beyond dispute, but may be applied too rigidly. Lord Minto, however, frankly acknowledged that his Government had the unfailing and effective support of the minister whenever its measures were challenged.

*Political "Unrest."*—Lord Minto went to India believing that what the country most needed was a respite from reforms, and proposed, as he expressed it, "to give the horse a rest in his gallop." But it was soon patent to him that the state of India was beyond an anodyne of the kind. He found widespread "unrest" among the educated classes, which took various forms. Of open organized disaffection there was little except in the dismembered province of Bengal and the newly created province of Eastern Bengal and Assam, where a very bitter agitation, accompanied by the boycott of British goods and frequent disturbances of the peace in which Mahommedans were mostly the sufferers, had been started by Hindu politicians with the object of obtaining a reversal of the partition. The movement kindled the flame of Bengal nationality and became invested with the religious sanctions of Hinduism. The "motherland" of Bengal, it was said, had been desecrated by foreign hands and Kāli, its tutelary goddess, cried for vengeance. Among an excitable and impressionable people crude notions of self-rule and political freedom easily "yoked themselves," as Lord Morley wrote to Lord Minto, "to deep invisible roots of alien race, creed and inviolable caste." The movement caught up students and teachers in schools and colleges and the poorer members of the professional classes. As it gathered strength and was fed by a rancorous press, among the publications of which the *Yugantar* (*New Era*) newspaper was the most notorious until its suppression in 1908, it led not a few of its misguided proselytes into the downward path of anarchical crime. Within two years of Lord Minto's arrival in India secret societies, radiating from Calcutta and Dacca and composed chiefly of young men belonging to respectable families, sprang up in many districts of the two provinces, having for their object the deliverance of India from the foreign yoke. This they sought to compass by assassination and terrorism. The art of bomb-making was imported from Europe. Revolutionary literature and the use of pistols and explosives were sedulously studied. Funds were obtained by gang robberies, usually committed at night and accompanied by murder and violence. In Oct. 1907 an attempt was made to blow up the train in which the lieutenant-governor of Bengal was travelling, in Dec. the district magistrate of Dacca was shot, in April 1908 two English ladies were killed in their carriage by a bomb intended for the district magistrate of Muzaffarpur. Police discoveries followed which made it clear that the Government was faced with a formidable revolutionary conspiracy, organized by obscure fanatics but directed by subtler brains, challenging the very existence of British rule and unamenable to political concessions. An anarchical movement of this kind was really alien to the Indian character. But the mass of the population was inert and terrified, and the moderate section of the politically minded classes was overborne by extremists, who, while dissociating themselves from the "physical force" party, extenuated their acts and laid the blame on the "partition" policy.

But the course which disaffection was to run in the two Bengals and its reactions elsewhere were unsuspected when Lord Minto examined the situation in 1906. The "unrest" which he found existing in other parts of India was of a kind which, notwithstanding disquieting features, was in the main not revolutionary or unconstitutional, and might yield to sympathetic treatment. English books and newspapers had familiarized the educated classes with the political ideas of advanced Western communities. They had become conscious of their strength and the power of the press and platform. The annual meetings of the National Congress, now in its twenty-first year, voiced the advanced views of the more ardent politicians. With increasing boldness the Congress leaders inveighed against the Government as a jealous bureaucracy, oppressive in policy, deaf to outside opinion and bent on excluding Indians from high administrative office. They dwelt on the poverty and stagnation of India and contrasted it with the brilliant progress made by Japan. What the National Congress said once a year, extremist Indian newspapers said daily. In the partition of Bengal, in the Universities Act and in other measures of Lord Curzon's administration they saw so many insidious attempts to crush their ambitions. Discontent and distrust were in the air. England, it was said, had come to the end of her liberating mission and India had nothing to hope for. Lord Minto took the view that novel forces and aspirations were at work that were natural and just, which the ruling power should not only meet but assist. "A change," he said, "is passing over the land and we cannot afford to dally." In the summer of 1906 he invited his executive council in a Minute to consider the question of political reform or, as he described it, "the possibility of the development of administrative machinery in accordance with new conditions." A tentative project of reform was drawn up in 1907, and with the approval of the Secretary of State in Council was published in England and India. In 1908 the Government of India reviewed it in the light of opinions received from various sources and submitted revised proposals to the Secretary of State. A bill, embodying them as finally settled, so far as they required parliamentary authority, was presented to Parliament by Lord Morley in Feb. 1909 and, after debates in both Houses, was passed with little amendment in May of that year and became law as the Indian Councils Act 1909.

*The Morley-Minto Constitution.*—The main object of the Act was to enlarge the Legislative Councils and make them more fully representative, introduce the elective principle, give greater powers of discussion and of obtaining information from the executive. Its provisions were wide and general, all details and some important matters of principle being left to rules to be made by the authorities in India. The Act fixed for each Council the maximum number of "additional" members (*i.e.* those other than the members of the executive councils), the number varying from 60 in the Imperial Legislative Council to 30 in the smaller provinces. The proportion of elected and nominated members in each Council, the formation of the electoral bodies, the qualifications of the electors and of persons eligible for election, the procedure of the Councils as regards debate, the moving and effect of resolutions and the asking of questions were left to rules. The actual constitution and powers of the Councils must therefore be sought in the rules. In each Council the nominated members comprised: (1) a substantial *bloc* of officials, the *bloc* in the Imperial Legislative Council being large enough to secure, together with the members of the executive council, an absolute majority; (2) non-officials nominated to represent classes or interests which would otherwise be unrepresented or inadequately represented. In all the Councils, with the exception of that of Bengal, the nominated members exceeded in number the elected members. The number of the latter in any province was too few to admit of any system of territorial constituencies and direct voting. Special constituencies therefore were formed, such as universities, chambers of commerce, groups of municipalities and district boards, the object being to obtain as far as possible a fair representation of the different classes and interests in the country. Special arrangements were also made for the representation of Mahommedans as a separate class or community. The Councils were empowered to discuss and move resolutions on the annual budget and in like manner to raise discussions by resolution on matters of general public interest. But they did not vote the budget and resolutions operated only as recommendations which were not binding on the Government. The Councils had no direct control over the executive, though they could inform and influence it. Lord Morley emphatically said that India was not ripe for parliamentary institutions and that he would be

no party to creating them. The Act also increased the number of members of the executive councils of Madras and Bombay from two to a maximum of four, thereby providing a seat for an Indian or two Indian members; it also authorized the creation of an executive council in any province having a lieutenant-governor. The policy of associating Indians with the executive government, thus affirmed as regards the provinces, had already been given effect to as regards the Government of India by the appointment of Mr. (afterwards Lord) Sinha to the Governor-General's executive council. Lord Morley had also placed two Indians on his own council. Of these reforms as a whole it may be said that they gave to India the beginnings of representative institutions and opened to Indians the highest offices of the State.

While the reforms were slowly maturing, increasing disorders in Bengal and the spread of disaffection in other parts of India gave cause for anxiety and made the prospect of an early appeasement doubtful. In the spring of 1907 the enactment of an unpopular law led to a violent anti-British movement in the Punjab. There were seditious meetings in the large cities, serious riots took place, endangering the lives of Europeans, in Lahore and Rawalpindi and attempts were made to tamper with the native army. In Bombay the irreconcilable extremist, Bal Gangadhar Tilak, a Brahmin of the notoriously disaffected Chitpavan sect, passionately advocated *swaràj*, or complete political independence, and in his newspapers, the *Kesari* and the *Mahratta*, denounced the foreigner and foreign rule. When the Muzaffarpur murders took place, the *Kesari*, in a casuistical argument, apologized for and condoned the use of the bomb in Bengal as the latest effective remedy against tyranny. For these articles Tilak was prosecuted and sentenced by the Bombay High Court to six years' imprisonment. Meanwhile another Chitpavan Brahmin established in London a hostel for Indians under the name of the India House, which became the centre of revolutionary plots in the Bombay Presidency. The extent of its machinations became known in the course of the proceedings pursuant to the assassination of Sir W. Curzon Wyllie at the Imperial Institute in London in June 1909 and of Mr. Jackson, the district magistrate of Nasik, in the Bombay Presidency. During this period the extremists sought to commit the National Congress to a rejection of the proposed reforms and to a programme of complete Home Rule, and might possibly have succeeded but for Tilak's conviction and imprisonment. Notwithstanding these unpropitious signs the Indian Government did not waver in their resolve to proceed with the reforms. "I am determined," said Lord Minto in his Legislative Council, "that no anarchical crimes will for an instant deter me from endeavouring to meet as best I can the political aspirations of honest reformers." In giving this assurance to the moderates his Government asked for and obtained increased powers to combat seditious incentives in the press and at public meetings and anarchical crime. In 1907 and 1908 laws were passed for prohibiting in proclaimed areas public meetings of a seditious character, for preventing the publication by the press of matter inciting to murder and other offences, for penalizing the manufacture and use of explosives and conspiracies connected with them, for establishing a special procedure and special tribunals for the trial of crimes of an anarchical nature and for making associations for certain objects unlawful (the Prevention of Seditious Meetings Act, 1907; the Newspapers' Incitement to Offences Act, 1908; the Explosive Substances Act, 1908; the Criminal Law Amendment Act, 1908).

*Tranquillising Effect of the Reforms.*—These measures, together with the better appreciation by the educated classes of the substantial nature of the proposed reforms, sensibly improved the situation. Mr. Gokhale, the leader of the moderate section of the nationalist party, a Brahmin of great intellectual capacity, high ideals and selfless devotion, effectively appealed to his countrymen to accept the reforms and, by making the best of them, to prove their fitness for larger political liberties. The King-Emperor's message to the princes and people of India, delivered on Nov. 2 1908, the jubilee of the late Queen Victoria's proclamation, had also a tranquillizing effect. The elections to the new Legislative Councils were conducted in a spirit of goodwill, and the discussions in the opening sessions in Jan. 1910 were marked by moderation and good sense. Though murders of public servants, gang robberies and other acts of terrorism still continued in Bengal and Eastern Bengal, Lord Minto in leaving India in Oct. 1910 was able to declare that the reforms had greatly cleared the air and that a happier feeling was abroad. Except for a serious failure of the monsoon in the autumn of 1908 and consequent losses of crops and cattle over a large area, the country generally was prosperous in Lord Minto's viceroyalty. Irrigation advanced rapidly in the arid tracts of the south-western Punjab and the wealth of the colonists attracted there from the populous districts of the province became proverbial. The ravages of plague continued unabated and in 1907 the recorded deaths (1,315,000) from the disease reached a maximum. An advisory committee constituted from the Royal Society and the Lister Institute explored the causation of plague and in the light of their researches the Government of India revised the administrative methods of dealing with it. The problem of plague was a part of the larger problem raised by the insanitary conditions of India, especially of the towns. To this increasing attention began to be directed, and steps were taken in Lord Minto's administration to establish a service of medical officers of health in the municipalities and to assist those bodies to carry out sanitary improvements. Among the cities so assisted may be mentioned Rangoon. An important Act establishing an Improvement Trust, to deal with the insanitary and congested areas of Calcutta, was enacted by the Bengal Legislature.

*Political Policy of Lord Minto.*—A new direction to the relations of the British Indian Government with the native states of India was given by Lord Minto. For some time past there had been signs that some of the ruling chiefs resented the control exercised over them and their states by the suzerain power and suspected it of a wish to increase that control. How far the discontent was justifiable is a matter of opinion. What is clear is that the growth of political ideas, increased contact with Europe and greater consciousness of their privileged position, had tended to make the princes discontented with a relationship which they had formerly accepted without hesitation. Lord Minto took occasion of a state visit to the Maharana of Udaipur to make a declaration of policy (Nov. 8 1909). Taking as his text the guarantee given to the feudatory princes and ruling chiefs in Queen Victoria's proclamation of 1858 and of King Edward VII.'s message of Nov. 1 1908, Lord Minto said that his Government proposed to follow a policy of greater sympathy and elasticity. They would not aim at enforcing uniformity or administrative efficiency and would not press British methods of administration upon the states, but preferred that reforms should emanate from the durbars and be in harmony with the traditions of the states. "The foundation-stone," he said, "of the whole system is the recognition of identity of interests between the Imperial Government and the durbars and the minimum of interference with the latter in their own affairs." The declaration and the spirit in which it was acted upon were very welcome to the ruling princes. Zealous political officers, when faced as they sometimes are with wrongdoing and oppression, may at times be inclined to regret the emphasis laid on non-interference. But it was an essential part of the policy of mutual trust and coöperation. The war vindicated its soundness.

Relations with Afghanistan continued good during Lord Minto's administration. The Amir maintained silence about the provisions of the Anglo-Russian Convention of 1907 affecting Afghanistan, and it was decided not to press him on the matter. He showed his confidence in Lord Minto by accepting the latter's invitation to pay him a friendly visit. He was received in state at Agra on Jan. 9 1908, and afterwards visited some of the principal cities of India. The Viceroy considerately abstained from discussing matters of business during the Amir's sojourn in India. The Amir was delighted with the kindness shown him and let it be known that his friendship with the British Government had been immensely strengthened. As regards the independent tribes on the N.W. frontier the only important event

was the sending of two punitive expeditions against the Mohmands and the Zakka Khels in the spring of 1910. Operations were over in less than a month.

*Lord Kitchener's Army Administration.*—The present military system of India, as regards the organization and administration of the army, is largely due to the changes effected by Lord Kitchener in Lord Minto's viceroyalty (*see* also the section on *Army* below). With the disappearance of the military department and military member of council, the administration of military affairs in the Government of India and the executive command of the army were united in the person of the commander-in-chief. As an exception to this unification, certain branches of army supply were at first made a separate department and placed under a supply member of council. But after three years' experience of the new system Lord Minto obtained the Secretary of State's assent to bringing supply under the commander-in-chief and making the latter supreme over all branches of the army. Briefly stated, Lord Kitchener's scheme was to provide a field army of sufficient strength to meet the maximum danger to which India was likely to be exposed, to distribute the troops composing the field army and those assigned for internal defence into self-contained divisional commands, and to give to the divisional commanders powers and responsibilities that hitherto had been exercised by army headquarters. As subsidiary measures the defences of the N.W. frontier were strengthened, and military equipment and the pay and conditions of service of the Indian army improved. The increase of military expenditure which the scheme involved was viewed with increasing disfavour by Indian nationalists. Lord Hardinge's Government, threatened with the loss of the opium revenue and anxious to find money for education and other civil needs, came to the conclusion that the Anglo-Japanese alliance and improved relations with Russia justified a reëxamination of the military requirements of India. The Secretary of State agreed to refer the question to a committee presided over by Field-Marshal Lord Nicholson. The committee were not unanimous and presented a majority and minority report. Before action was taken on these reports war with Germany and Austria broke out.

*Lord Hardinge as Viceroy.*—In the spring of 1910 the appointment of Lord Kitchener to succeed Lord Minto as Viceroy seemed probable. Lord Morley records in his *Recollections* (vol. ii., page 333) the objections he felt to the appointment of a soldier, and was prepared to carry them to the point of resignation. His view prevailed. Fate reserved Lord Kitchener for greater tasks and the choice fell on Sir Charles Hardinge, permanent Under-Secretary for Foreign Affairs and formerly ambassador at St. Petersburg. On his elevation to the peerage he took the title of Lord Hardinge of Penshurst. Lord Hardinge's long viceroyalty (Nov. 1910—March 1916) was strenuous and eventful. The earlier years were marked by the visit of King George V. and the Queen to India, the selection of Delhi as the site of the future capital of the Indian Empire, the revision of the "partition" of Bengal and the nefarious attempt of anarchists to compass the deaths of the Viceroy and his wife on the occasion of their state entry into Delhi. The closing years saw India in the throes of the World War. Lord Hardinge, like his predecessor, had an hereditary connexion with India, as his grandfather, the 1st Viscount Hardinge, was Governor-General (1844–8) in the stirring times of the first Sikh War. The goodwill of Indians toward the new Viceroy deepened as they saw his genuine liking for their country; his zeal, carried on one occasion to the point of an indiscretion, to obtain redress of the grievances of Indians residing in other parts of the Empire; and his endeavours to associate their political leaders to the fullest extent possible with the work of government under the reformed Councils scheme. His diplomatic and Foreign Office experience and knowledge of the politics and conditions of the East enabled him to handle dexterously and effectively the external affairs of India and to enter into the difficulties and apprehensions of Indian Mahommedans. He cordially pursued the policy of friendship and coöperation with the ruling chiefs of native states that Lord Minto had inaugurated. Events outside India were beginning to attract the attention of Indians as in no former time. The Mahommedans watched with disquietude the Italo-Turkish War, the revolution in Turkey and the Balkan wars, while Indian politicians and the durbars of native states noted the signs of coming trouble in Europe and speculated as to the results of a catastrophic war. It was an advantage that at this juncture the head of the Indian Government was exceptionally qualified to interpret these world commotions to the Indian public and to explain the attitude of the British Government. Lord Hardinge's addresses to his Legislative Council and to deputations and his speeches on occasions of ceremonial visits to native states, removed misconceptions and inspired confidence. When the World War came in 1914 the popularity of his administration and the personal influence and friendship which he had acquired with the ruling princes had much to do with the magnificent response of India to the call of the Empire.

*Working of the Morley-Minto Reforms.*—Lord Minto's prediction that the conciliatory measures associated with the reform of the Councils, coupled with the preventive measures which his Government had taken, had cleared the political atmosphere proved correct. On Jan. 5 1911 an important deputation from the Indian National Congress presented an address to the new Viceroy in which they expressed deep and heartfelt loyalty to the Crown and appreciation of the reforms, which "had given the Indian people a larger opportunity than they had before of being associated with the Government in the administration of the country," and which "had done much to bring about a better understanding between the Government and the people." The hope subjoined to these expressions of goodwill that "the regulations in connexion with the Councils which had evoked criticism will be modified in the light of experience" had reference to the provisions for communal and class representation and indirect voting, to which the advanced nationalist party had taken objection on the publication of the regulations. They had set their hopes on large territorial constituencies based strictly on numbers, and were disappointed with a constitution which in these and other respects fell short of their political ideals, and which gave special protection to the Mahommedan community, the landowning classes and other important interests. But as the enlarged Legislative Councils settled down to their work, even the advanced party found in the new powers a healthy outlet for their energies. Social and economic measures, such as compulsory education, alteration in the Hindu law of marriage and the Mahommedan law of property, the encouragement of indigenous industries, the prohibition of emigration beyond seas under indenture to labour, were brought forward in the form of resolutions or bills. Acts of the executive government or its officers were made the subject of questions or debate. The annual financial statement of the Imperial Government or local government, as the case might be, was closely scrutinized and criticized and gave openings for discussion ranging over the whole field of imperial or provincial finance. As already said, the Councils might influence but had no direct control over the Government. They could not turn the executive out of office or refuse supplies. Later on this and other limitations became a serious grievance, but at first they were little dwelt upon. The Governments, Imperial and provincial, showed themselves anxious to adapt their policy and measures as far as possible to popular needs as expressed by the elected members, to show deference to Council resolutions having public feeling behind them, to investigate and remedy alleged grievances and abuses, and when legislating to rely less on voting power than on argument in debate, coupled with concessions on points of detail or secondary importance. As consultative and critical bodies the reformed Councils exercised a real and growing influence and were an educative force. They formed, directed and developed public opinion in political matters. They acted as a restraint upon the autocratic tendencies of the executive and made it more responsive to popular demands, and they strengthened its hands when it had to sustain Indian interests against the interests of Great Britain or of the self-governing Dominions.

The temper of the Legislative Council was tested in the

first session by the proposal of Lord Hardinge's Government to place permanently on the statute-book the Prevention of Seditious Meetings Act, which had been enacted in 1907 at the time of the Punjab disturbances as a temporary measure. Mr. Gokhale and three other leading nationalists were opposed to the retention of the Act on the ground that the general situation was no longer such as to justify so exceptional a measure. But the majority of the non-official members were content to accept Lord Hardinge's assurance that the lapse of the Act would endanger the public tranquillity, and his promise that it would never be applied to any part of India unless a clear necessity arose. In the same session the announcement that the King-Emperor and Queen-Empress would visit India in the winter was received with great enthusiasm.

*The King's Visit.*—The royal visit was a complete success. The presence of the King-Emperor and his consort in India touched the imagination of the people. The Delhi ceremonies drew vast crowds eager to see and salute the sovereign. When a visit to Calcutta followed, the welcome given by the populace of that city was even more enthusiastic and unrestrained. On Dec. 12 1911, in a great arena outside Delhi specially prepared for the occasion, the King held a coronation durbar at which he received in person the homage of the great officers of state and the ruling princes and chiefs of the Indian Empire. Largesse and "boons" of various kinds were granted and an announcement made of great political moment. The seat of the Government of India was to be transferred from Calcutta to Delhi; Eastern Bengal reunited to Bengal and the enlarged province given a Governor in Council; Bihar, Orissa and Chota Nagpur, tracts which are loosely connected with Bengal proper, made a Lieutenant-Governorship in Council; and Assam formed into a Chief Commissionership. The secret had been well kept and the surprise was complete. The scheme, though open to obvious objections, was ingenious and cleverly balanced. A reasoned exposition of its object is contained in a despatch, dated Aug. 25 1911, from the Government of India to the Secretary of State, submitting the proposed changes for the home Government's approval in advance of the King's visit. In the foreground was placed the desirability of removing the Government of India from Calcutta, where its presence diminished the dignity and responsibility of the local Government, and where it unavoidably was subject to Calcutta opinion to the exclusion of that of other parts of India. The removal of the Government of India to a capital of its own would, it was urged, facilitate the growth of local government in India on sound and safe lines. India was envisaged as consisting in the not remote future of a number of administrations, autonomous in all provincial affairs, with the Government of India above them all, but with its functions ordinarily restricted to matters of Imperial concern. It was essential to this evolution that the central Government should not be associated with any local Government, but should have a separate and independent capital. The withdrawal from Calcutta of the Government of India would also, it was urged, make a second long-desired object possible. Calcutta could be made the seat of a Governor-in-Council and placed on an equality with the two other presidential capitals. As to the third change proposed—the modification of the "partition"—the despatch laid stress on the unforeseen bitterness of feeling, "widespread and unyielding," which the partition had created, and on certain real disadvantages to which it had subjected the Bengalis in both provinces into which the old province had been divided. In each province the Bengalis were in a minority. "As matters now stand, the Bengalis can never exercise in either province that influence to which they consider themselves entitled by reason of their numbers, wealth and culture." The scheme met Bengali sentiment on that point. But the triumph of the agitators against the "partition" was not unmixed. Bengali pride had to reconcile itself to the loss of prestige consequent on the withdrawal of the supreme Government from Calcutta, and to the recognition of Dacca, the old Mahommedan capital of Eastern Bengal, as the second capital of the reunited province. The last provision, it was hoped, would tend to reconcile the Mahommedans of Eastern Bengal to the changes. But they and their coreligionists in other parts of India regarded the revision of the "partition" as a Hindu victory and a blow to their community. The suspicion and resentment thus engendered augmented the unrest which events in Europe were exciting among them. Such was the scheme and its objects. In the months following the Delhi durbar it ran the gauntlet of criticism in England and in India. Strong objection was taken by its critics to the undoing of the "partition," "the settled fact" which Lord Morley had refused to disturb. Objections equally strong were taken to the removal of the Government of India from direct contact with the largest and most powerful European community in India and the segregation of its officials from the outside world. The authority of Parliament, it was also said, had been flouted. The King's ministers had suffered a royal announcement to be made of changes of the highest moment before Parliament was allowed to discuss them. There was force in the contention. Parliament was confronted with a *fait accompli*, and the circumstances were such as to prevent it from enforcing, if it wished, the responsibility of ministers. Time alone will test the wisdom of these changes, autocratically conceived and dramatically carried out. The building of the new capital has been thrown back by the war, and the cost will largely exceed the estimated sum of four millions sterling. New Delhi, it is urged by opponents of the scheme, will be merely the cold-weather headquarters of an official hierarchy, an imposing mass of buildings untenanted for climatic reasons during eight months of the year; while the Government of India, rotating between it and Simla, will live perpetually in a bureaucratic atmosphere. On the other hand the drawbacks of Calcutta were many, and recent constitutional changes have emphasized the desirability of removing the supreme Government from immediate contact with the internal administration of Bengal. The presidential Government of reunited Bengal is an undoubted success, the bitterness of feeling engendered by the "partition" has disappeared, and the interests of the Mahommedan population of the Eastern districts receive a just measure of attention from the local government. The province of Bihar and Orissa is the weak feature of the scheme. The artificial union of two blocks of territory lying geographically apart and without linguistic or racial affinities can never be a convenient administrative unit, and may eventually give place to a better arrangement.

*Lord Hardinge's Internal Administration.*—The period from the conclusion of the royal visit to the outbreak of the World War was one of administrative progress and constitutional advance, not however without incidents and movements of serious import. The finances were satisfactory. The reformed Legislative Councils were working well. The relations of the non-official members with the Government were cordial and helpful. Much attention was given in the provincial Councils, as also in the Imperial Legislative Council, to matters of education, public health and local self-government, and interest was stimulated by the considerable grants for these purposes which the central Government was able to make from imperial revenues to local governments. In closing the budget debate in his Council in March 1912, Lord Hardinge defined the duty of his Government, as he conceived it, to be "to turn all our energies to the uplifting of our people. Only by the spread of knowledge and by the resolute struggle against disease and death can India rise among the nations." The beginning of a sustained advance in popular education was made at the Delhi coronation durbar, at which a recurring grant of 50 lakhs (£333,000) to local governments for the purpose was announced. (Here and elsewhere the conversion of rupees into sterling has been made on the basis of Rs. 15 = £1. *See* note under *Finance* below.) This was followed in succeeding years by larger grants. From 1911 to 1915 non-recurring grants amounting to 3¼ millions sterling and recurring grants of £826,000 were made to the provinces. The total annual expenditure on education rose during the period by nearly 3 millions sterling, and the number of boys and girls at school or college by one million and a half. This expansion was numerically greatest in the primary schools. A wide educational policy was laid down, embracing the universities and

secondary and technical schools and colleges. Research and post-graduate instruction were promoted in the universities. The existing universities, which were of the affiliating and examining type, had become unwieldy. They served vast areas and required to be supplemented by resident universities, in which teaching would predominate over examinations, and an academic atmosphere would be created. The universities now established at Dacca, Patna, Rangoon and Lucknow are of this type. The Benares Hindu University, the creation of which was largely due to the energy and capacity of Mrs. Annie Besant, is on similar lines, though sectarian in character. The Moslem University at Aligarh is also of this type. With the problem of university reform the organization and condition of the affiliated colleges and of the secondary schools which feed the latter were intimately connected. Their improvement formed part of Lord Hardinge's educational programme, but the subject was full of difficulty and in most provinces reform was delayed by the war. With regard to technical education mention may be made of the establishment of a well-equipped medical college at Lucknow, raising the number of medical colleges in India to five, of schools of tropical medicine in Calcutta and Bombay and of an institute of science at Bangalore. In the domain of public health Lord Hardinge's Government similarly encouraged progress in the provinces by imperial grants. Non-recurring grants to the amount of £2,700,000 and recurring grants of £368,000 were made. A great impetus was thus given to sanitary measures. The capital grants rendered practicable the execution of sanitary measures which a few years before seemed beyond the limits of financial responsibility.

In several other cases the action of Lord Hardinge's Government faithfully reflected the views and sentiments of Indians and had the strong support of the Legislative Council. Regrets and some resentment were expressed by that body when proposals made by the Government of India for the establishment of a High Court in the Punjab and an Executive Council in the United Provinces failed to obtain the sanction of the home authorities. The appointment of a royal commission to inquire into and report on the public services of India with a view to increasing the proportion of Indians in the higher offices met aspirations expressed in a resolution moved in the Legislative Council and was warmly approved. Another popular measure was the establishment of a Legislative Council in the Central Provinces. But much greater feeling was provoked by the position of indentured labour in the Colonies to which it was permitted and by the treatment of Indian residents in South Africa and Canada. The first trouble arose over the refusal of the Natal Government to accept Indian immigrants as permanent citizens of the Union after the expiration of their indentures. As no redress was obtained the Government of India in 1911 prohibited for the future indentured emigration to Natal. In the following year the grievances of the Indians domiciled in the Union against the Union Government came to a head. The Immigrants' Regulation Act of the Union Government was considered by them to deprive them of rights guaranteed under an agreement. The Indian settlers resorted to "passive resistance." The situation was aggravated by strikes and riots among Indian labourers in Natal. Intense feeling was aroused in India by reports of the treatment of passive resisters by the magistrates and the rough handling of strikers and rioters by the police. Lord Hardinge in a speech delivered in Madras (Nov. 24 1913) expressed evident sympathy with the passive resisters in their struggle against "invidious and unjust laws," referred to allegations that the movement had been dealt with by measures that would not be tolerated in any civilized country, and pressed for an inquiry in South Africa by a strong and independent committee on which Indian interests should be fully represented. The Union Government resented the Viceroy's language, which admittedly was not very discreet. But the calculated indiscretion served its purpose. A Commission of Inquiry was appointed, but objection was raised to its composition by the Indians in South Africa. Eventually, after a period of tension, the Union Government agreed to the deputation of a distinguished Indian civilian to represent Indian grievances before the Commission. A satisfactory solution was at length reached and embodied by the Union Government in its Indian Relief Act, 1914. This closed the passive resistance struggle. The controversy had been followed in India with passionate interest. In the action they took Lord Hardinge's Government had the warm approval of the educated classes. With regard to Canada the grievances of Indians were less easy of settlement. Indians resented the refusal of the Canadian authorities to admit them as settlers and contrasted it with the more liberal treatment accorded to Japanese under an arrangement with the Japanese Government. In the face of Canadian feeling on the subject Lord Hardinge considered that the only course which was likely to conciliate Indian public opinion and secure a lasting settlement with the Dominion Government was a policy of reciprocity, which could be made effective without direct retaliation and would not raise questions of the personal status of Indians in Canada. Some progress has been made towards an agreement on these lines.

*Attempt on Lord Hardinge's Life.*—In the period immediately preceding the World War the only exception to the general tranquillity of the country was the persistence and extension of the revolutionary movement in Bengal and the growing unrest of the Mahommedan community. In Bengal the revolutionary societies which had been quiescent for a time again became active towards the close of 1912. On Dec. 23 1912, as the Viceroy was making a state entry into Delhi, a bomb was thrown and exploded in the *howdah* of the elephant on which he and Lady Hardinge were riding, severely wounding him and killing an attendant. The assailants were never brought to justice, but there is little doubt that they were connected with the revolutionary movement in Bengal which had extended to the Punjab. The organization of the revolutionary societies, their interconnexion and propaganda methods, their success in corrupting the educated youth of the country, are minutely described in the report of the Sedition Committee (1918) over which Mr. Justice Rowlatt presided. By 1912 the movement had largely lost its religious and national motive and had become definitely terroristic, anti-British and predatory. It sought to demoralize the police by violent crime, often committed in crowded thoroughfares and open daylight, to overawe the public, and ultimately to subvert the Government. Recruits were attracted by the boldness of the conspirators, their practical immunity from capture and punishment, and the booty which they acquired by midnight robberies in force. By the end of 1913 the ordinary forces of law and order had been definitely beaten. The Bengal Government found itself in a very dangerous position, but still hesitated to resort to extra-judicial methods. Matters grew worse in the following year, when war broke out. To complete the narrative it may here be mentioned that German agents in America and the Dutch East Indies, getting into touch with Indian anarchists abroad, arranged to support a general rising in India by supplying arms and money. Some ships were fitted out for the purpose in 1915 and arrangements for the landing of the arms were made with the revolutionary leaders in Bengal. Fortunately the undertaking miscarried; the ships failed to arrive; the Indian authorities got on the track of the scheme; the chief conspirators were hunted down; and a vigorous use of the power of internment given by the Defence of India Act broke up the revolutionary gangs and restored order in the presidency.

*Mahommedan Discontents.*—The outbreak of war between Italy and Turkey in 1911 followed by the Balkan War in 1912 excited the feelings of Indian Mahommedans, always sensitive to events affecting their co-religionists in other countries. Turkish reverses aggravated the situation and created the impression that the interests of Christendom and Islam were in serious conflict. The tension was increased by the intemperate language of a section of the Mahommedan press, by meetings to express sympathy with Turkey and by collection of funds for sending medical relief to the Turkish forces. The local governments found it necessary to enforce the Press Act and other restrictions. A state of alarm and irritation in the Indo-Mahommedan community invariably leads to bad relations

with other communities. Any insignificant local incident may then be the occasion of unbridled widespread agitation and possibly disturbances of the peace. In 1913 the removal by the Cawnpore municipal board of a building claimed by the Mahommedans to belong to a mosque was taken by them as an insult to their faith and led to a serious riot (Aug. 3 1913). This was followed by bitter press attacks on the Government for its anti-Mahommedan policy. Lord Hardinge, to allay an agitation which was growing serious, made an earnest appeal in his Legislative Council (Sept. 17 1913) to Indian Mahommedans to cultivate sanity of judgment and self-restraint and to rely on the good-will of the British Government towards Turkey, and himself visiting Cawnpore brought about a settlement over the heads of the local authorities. This exceptional step may be held to have justified itself by the appeasement that followed. The restoration of peace in the Balkans further relaxed the tension. From then onwards until the World War the state of Mahommedan feeling in India gave little cause for anxiety.

*The World War: India's Effort.*—On the outbreak of the World War in Aug. 1914 Lord Hardinge's administration entered upon the third stage. He had won great popularity. The country as a whole was exceedingly quiet. Relations with Afghanistan and the frontier tribes were good. The magnificent response made by India to the needs of the Empire is a matter of world history. "Nothing has moved me more," ran the King-Emperor's message delivered by the Viceroy to the Legislative Council on Sept. 8 1914, "than the passionate devotion to my throne expressed both by my Indian and English subjects and by feudatory princes and chiefs of India, and their prodigal offers of their lives and their resources in the cause of the realm." On the motion of an Indian member the Council unanimously affirmed their unswerving loyalty, promised unflinching support to the British Government, and offered on behalf of the people of India to share in the cost of the war. The Council reflected the general attitude of the country. In the hour of stress the deep-rootedness of the British connexion and its indispensability to the safety of India were clearly realized. All thinking Indians saw that in this matter British and Indian interests were identical. The political leaders instinctively suspended their controversies with the Government and gave it their support. The martial classes eagerly responded to the call to arms. From the rulers of native states lavish offers of help poured in. They were recounted in the Viceroy's telegram to the Secretary of State, dated Sept. 7 1914, which was read in both Houses of Parliament and circulated throughout the Empire. As a wonderful demonstration of loyalty and generosity, its effect on popular feeling was immense.

With this confidence and enthusiasm were mingled some alarm and bewilderment. Trade came to a standstill. There were runs on the banks, withdrawals of deposits, encashment of currency notes and hoarding of coin. Timid Marwari traders of Calcutta closed their businesses and fled to Rajputana. In the remoter districts rumours of the collapse of the British *raj* disturbed the countryside. The Mahommedan peasantry in the Jhang district and in adjoining districts of the south-western Punjab raided and burnt the houses of Hindus and moneylenders, and military force was required to restore order. In Bengal the revolutionary societies redoubled their criminal activities. In San Francisco and Vancouver an Indian revolution was openly preached to the Sikhs settled there, and numbers of them were incited to return to the Punjab to take part in a general rising. Their designs were detected, their plots to seize arsenals and tamper with the troops were frustrated, and a formidable conspiracy was broken up by a vigilant local government having behind it the goodwill and help of the rural population. But for some months the Punjab was disturbed by murders, dacoities, and robberies and the reckless use of arms and explosives.

In India as a whole the situation was so satisfactory that the Indian Government was able to denude itself freely of its military resources to meet the insatiable demands of the home Government for troops and war material. Most of the British troops, the flower of the Indian army, the best of the artillery, and large quantities of ammunition were despatched to France and other theatres of war. In Sept. 1914 a force of 70,000 men was sent to France. By the end of 1915 India's contribution amounted to nearly 80,000 British and 210,000 Indian officers and men. At one time the original British garrison was reduced to only 15,000 men. These were gradually supplemented by territorial and garrison troops from home, but throughout the war the British element in the army in India was dangerously below the defensive needs of the country. The expeditionary forces sent from India to France, Gallipoli, Egypt and East Africa passed on arrival to the control of the home Government, and the responsibility of the Indian Government for them was thereupon confined to replacing losses by fresh drafts and providing supplies.

*Mesopotamian Expedition.*—It was otherwise with the expedition sent to Mesopotamia. Until the spring of 1916 the home Government, though it initiated the expedition and directed the policy, left the control and management to the Government of India. In the judgment of the Mesopotamia Commission, this division of responsibility was unfortunate. The expedition at first had a very limited objective. It was sent to occupy Basra in the event of Turkey declaring war. Its scope was gradually enlarged and the strength of the force increased until by Sept. 1915 a series of successes brought it within striking distance of Bagdad. The circumstances in which Sir John Nixon sought and obtained permission to advance on Bagdad, the failure of the attack on the Turkish position at Ctesiphon, the disastrous retreat on Kut el Amara, and the capitulation of the besieged British force on April 29 1916 are narrated in the report of the Mesopotamian Commission. The report reflected severely on the Indian authorities and on the organization and equipment of the army in India, on the Secretary of State and his advisers and on the Cabinet. But by the time the report was published (May 17 1917) Lord Hardinge was no longer Viceroy, the early defects of the expedition had been repaired, a series of defeats inflicted on the Turks, and Bagdad captured by Sir Stanley Maude. The inquiry had therefore no effect and was barren of results.

The entrance of Turkey into the war placed Indian Mahommedans in a difficult position; but along with the rest of India they loyally rallied to the side of the Crown. Against a few prominent agitators only was it necessary to take action. The premier Mahommedan prince, the Nizam of Hyderabad, and the Begum of Bhopal, in addresses to their co-religionists, effectively stated the British case and exposed the falsity of the pretexts by which Enver Bey and his associates sought to justify the entrance of Turkey into the war. These addresses, and a declaration by the Government of India as to its attitude towards Islam in general and the Holy Places in particular, served greatly to maintain tranquillity.

*War Measures of Indian Government.*—Among the many other important matters arising out of the war during Lord Hardinge's Government the following may be noted:—

(1) *Recruitment.*—The pre-war recruitment for the Indian army, which is on a voluntary basis, was about 15,000 men a year. In order to meet the needs of the armies in the field and to keep the units in India up to strength it had to be increased eightfold. The task proved one of increasing difficulty, and required the closest coöperation between the military and civil authorities and the loyal support of the landowning classes. The races and castes from which serviceable recruits could be drawn were an insignificant minority of the vast population. Before long the Punjab, which furnished 50% of the fighting forces, showed signs of over-recruiting. (2) *Supply of Stores and Munitions.*—India served as the basis of supplies for the Mesopotamian force and for Indian troops employed elsewhere. It also furnished to the Allies essential materials of which they stood in need. The low development of Indian industries made State assistance and supervision, and in some cases control necessary. At a later stage Lord Chelmsford set up a central Munitions Board with branches in all provinces. It effected great economies and did much to encourage the manufacture of supplies that formerly could only be obtained from abroad. (3) *Regulation of Prices and Control of Export.*—Measures were taken to moderate the high prices of food grains, which were causing much distress and discontent among the poorer classes, and to prevent hoarding and profiteering. The Government obtained powers by Ordinance to take possession of stocks unreasonably withheld from the market. Private exports of wheat were prohibited, but the Government arranged to purchase for the United Kingdom considerable quantities

within limits of price. Later on the same system of control over export and prices was applied to the Burma rice crop. Control over exports generally was also exercised to prevent goods from going to the enemy. (4) *Internal Security.*—The statutory power which the governor-general has to legislate in an emergency by Ordinance was freely exercised to secure the safety of the realm. Of these Ordinances the more important were the Indian Naval and Military News Ordinance; the Foreigners Ordinance; the Ingress into India Ordinance; the Commercial Intercourse with Enemies Ordinance; the Articles of Commerce Ordinance. The duration of an Ordinance is limited by statute to a period of six months, but the Indian Legislature passed an Act in 1915 to keep these and other specified Ordinances in force during the continuance of the war and for six months after. The Indian Legislature in March 1915 also enacted the Defence of India Act, giving the Government very wide rule-making powers for the purpose of securing the public safety and the defence of British India. It also enabled the Government to provide in any notified districts for the trial of certain classes of heinous crime by a special tribunal of three commissioners. It may be mentioned that many of its provisions were reënacted in a modified form by the Rowlatt Act of 1919 (the Anarchical and Revolutionary Crimes Act 1919).

*Retirement of Lord Hardinge.*—In Nov. 1915 Lord Hardinge completed his fifth year as Viceroy, but at the request of the home Government remained in office until the following April. In a farewell speech to his Legislative Council he said that, with a reservation as to Bengal, "the internal situation of India could hardly be more favourable." Heads of provinces had informed him that never in their experience "had the relations between the Government and the people been closer or of greater confidence." He expressed his wish to see "the early realization of the just and legitimate aspirations of India," but, with an obvious reference to the Home Rule movement which Mrs. Annie Besant (the head of the Theosophical Society in India) had started in Madras, and to the advocacy of "self-government on colonial lines" by Indian nationalists, he besought his hearers not to be led astray by impracticable ideals, but to look facts squarely in the face and to realize that in the Dominions self-government had been the slow product of steady and patient evolution.

*Lord Chelmsford's Administration.*—Lord Chelmsford, the new Viceroy, assumed office on April 4 1916. Lord Hardinge, in referring to his successor, had characterized him as a man of "noble ideals and generous sympathy." He was in his forty-eighth year. He had been an active member of the London School Board and the London County Council, and had made acquaintance with constitutional problems as governor of Queensland and then of New South Wales. At the time of his selection he was serving with his territorial battalion in India. His administration covered one of the most difficult and momentous periods of British-Indian history, whether as regards the pressure of world events, the complexity of the forces acting in and upon India, the difficult and dangerous situations that arose, the number and magnitude of the problems demanding solution and the gravity of the issue they have raised. With the prolongation of the war India had lost its first enthusiasm and its first alarm. Its remoteness induced a sense of security and obscured the vital issues that were still in balance. High prices, scarcity of imported commodities and unaccustomed restrictions on trading and travel fretted the masses. Among the educated classes national aspirations were quickened by the increasing share taken by India in the war, by the generous recognition of its services and admiration of its resources accorded by other members of the Empire, by the association of representatives of India on terms of equality with the ministers of Dominion Governments in the Imperial War Conference, and by the knowledge that the constitutional relations of the component parts of the Empire would be readjusted after the war. Politicians became apprehensive lest the claims of India might go by default unless asserted promptly.

*"Home Rule" Movement.*—In the first year of Lord Chelmsford's administration the political peace enjoyed by his predecessor came to an end. In the early part of the year Mrs. Besant succeeded in getting her scheme of Home Rule considered by leading members of the National Congress and the Moslem League. She continued to advocate it with great energy among students and schoolboys in Madras, established a Home Rule League, celebrated a "Home Rule" day, and declaimed in her paper *New India* against the Government. Mr. Tilak, who had been released from prison in 1914, was equally active in Bombay. In Oct., 19 elected Indian members of the Imperial Legislative Council submitted a memorandum on proposed reforms to the Government of India. They described the Morley-Minto reforms as having created Legislative Councils which were mere advisory bodies without any effective control over the Government, Imperial or provincial. They propounded a scheme which, while retaining irremovable executives responsible to Parliament and the Secretary of State, would have subjected them in legislation, finance and administration to the orders of a legislative body, in which elected members would be predominant. These proposals were adopted in substance a few months later by the National Congress and the Moslem League. In the Montagu-Chelmsford report they were subjected to close examination and pronounced impracticable and wrong in theory. A legislature and an executive deriving their authority from and responsible to different authorities must come to a deadlock which could not be resolved, as it would be under a genuine parliamentary system, by a change of Government. From this adverse judgment the authors of the Montagu-Chelmsford Report advanced to their own solution of the problem—the division of the administration into two halves, one an official executive responsible to the British Parliament and the Secretary of State, and the other an executive of ministers responsible to the Legislature. The Congress-League scheme has from its very defects an historical value in the evolution of the present Indian constitution.

To return to the course of events. At meetings held at Lucknow in Dec. 1916 the National Congress and the Moslem League, as the result of lengthy negotiations, agreed upon a scheme of reforms based on the proposals of the 19 members, and resolved to put it before the public, through the agency of the Home Rule League, as the irreducible minimum with which the national party would be content. The scheme became known as the Congress-League scheme. By this time the nationalist party led by Mrs. Besant and Mr. Tilak had become dominant in the Congress. The Moslem League, originally founded for the protection of Moslem interests against Hindu ascendency, had similarly fallen under the influence of the "young" Mahommedans, who made Home Rule their objective and joined forces with the Congress on the condition that in certain provinces in which the Mahommedans were in a minority they were guaranteed a proportion of seats in the future Legislative Councils in excess of the number they could hope otherwise to win. Effect was given to this compact, henceforth known as the "Lucknow Compact," in the Congress-League scheme. Following the Lucknow conferences an energetic Home Rule campaign was opened in all provinces. Mrs. Besant's activities in Madras caused the Madras Government in June 1917 to require her and her lieutenants to abstain from attending public meetings and making speeches, to leave Madras city and to take up their residence in one of several specified areas. This order made a great sensation throughout India. Protest meetings were held to procure its withdrawal. It was thought to be the forerunner of a general policy of repression, and added fuel to the agitation for Home Rule. The stir in the nationalist camp was quickened by the knowledge that the views of Lord Chelmsford's Government on political reforms had for some time past been before the home authorities. Other incidents deepened the feeling of uneasiness among Indian politicians. The belated publication of the report of the Royal Commission which, with Lord Islington as president, had since 1913 been inquiring into the Indian public services with a view to the admission of Indians in larger numbers, did not mend matters. Its recommendations were pronounced unsatisfactory and inadequate. A frank declaration of policy by the British Government as to the future political development of India became increasingly necessary.

The fault of delay did not rest with the Indian Government. From the moment of his assumption of office Lord Chelmsford

had been impressed with the urgency of the matter. A preliminary and informal examination of the changes possible and prudent had been made by Lord Hardinge. Lord Chelmsford took up the inquiry from the point where his predecessor had left it. At the close of 1916 his Government submitted to the Secretary of State a considered scheme of reforms, and asked for an authoritative declaration of policy. Was the goal for the Indian peoples to be responsible government? If so, by what stages and steps should it be reached? The questions raised were large and delicate. The Cabinet was preoccupied by the war. In July 1917 the Secretary of State, Mr. Austen Chamberlain, resigned on the report of the Mesopotamian Commission.

*Declaration of Aug. 20 1917.*—It fell to his successor, Mr. Montagu, to announce on Aug. 20 1917, in the House of Commons, the policy of the Government with regard to India. "The policy of H.M. Government," he said, "is that of increasing the association of Indians in every branch of the administration and the gradual development of self-governing institutions with a view to the progressive realization of responsible government in India as an integral part of the British Empire." After stating that the Government had decided that substantial steps in this direction should be taken as soon as possible, and that he was going to India to examine the matter in conjunction with the Viceroy, he ended with an important caution:—"Progress in this policy can only be achieved by successive stages. The British Government and the Government of India, on whom the responsibility lies for the welfare and advancement of the Indian peoples, must be the judges of the time and measure of each advance, and they must be guided by the coöperation received from those upon whom new opportunities of service will thus be conferred and by the extent to which it is found that confidence can be reposed on their sense of responsibility."

This announcement, though its qualifying words were not liked by the extreme nationalists, somewhat cleared the air in India, and Mrs. Besant's release had a further tranquillizing effect. In the Mahommedan camp there were signs of discord. Conservative Mahommedans did not like the Lucknow Compact with the Hindu leaders. Mahommedan feelings were stirred by the reverses suffered by Turkey and the growing power of the Sherif of Mecca. In Sept. the Hindu population attacked their Mahommedan neighbours in the Shahabad and Gaya districts of Bihar over the cow-killing question, and bloody and destructive riots occurred before order was restored by force.

*The Montagu-Chelmsford Report.*—In the course of the winter Mr. Montagu visited India. The results of his mission were embodied in a joint report by himself and the Viceroy, drawn up before he left India, and bearing date April 22 1918. The report is a lengthy and able document, written in an attractive and picturesque style. It described the existing administrative system and led up to the conclusion that the political development of the provinces was stifled by the rigid control which the central Government was compelled to exercise in discharge of its responsibility to Parliament. In the course of 10 years the national consciousness and the desire for political power had grown with unexpected rapidity, and the Morley-Minto constitution no longer satisfied Indian opinion. The report then described the social and political conditions of the different sections of the Indian population, with the object of showing that responsible government could not be introduced at once over the whole field of administration; and examined and pronounced impossible the Congress-League scheme of reforms. In the second part of the report the authors set out their own proposals. These, in brief, were that the provinces should be the domain in which the earlier steps towards the progressive realization of responsible government should be taken, and that the only possible plan was to divide the functions of provincial governments into those that might be made over to popular control and those which for the present must remain in official hands. This novel and ingenious plan of dual Government has received the name of "dyarchy." The Montagu-Chelmsford scheme of reforms and the action which was taken on it by Parliament are described below (*see* under *Administration*).

*War Conference of 1918: India's Increased Effort.*—The Montagu-Chelmsford report was nearing completion at Simla when the Viceroy's attention was recalled to the pressing realities of the war. In the Near East, German troops had penetrated the Caucasus and Turks were invading Persia. With the collapse of Russia a road to Afghanistan and thence to India seemed possible. In a telegram (April 2 1918) which reflected the anxieties of the western front though it referred to what was happening in the East, the Prime Minister made a strong appeal to the Government and people of India to redouble their efforts and prevent German tyranny from "spreading to the East and engulfing the world." Lord Chelmsford's response was to convene a war conference at Delhi, to which many ruling princes and representatives of all provinces of every shade of opinion were invited. There he earnestly besought all classes to suspend political strife, to concert measures for gathering up the whole man-power and resources of the country, and to accept cheerfully the necessary sacrifices. The conference heartily and loyally responded to the appeal and agreed upon a programme of measures of no small value. The better organization of recruiting and materials of war was entrusted to boards. A scheme of territorial recruitment was mapped out whereby each province would furnish its quota of men. The ruling princes, who, as always, were prœminently helpful and practical, undertook to furnish larger contingents and to open their dominions to British recruiting parties. The conference was followed by similar conferences in all the provinces. These did much to rekindle public interest in the war and to enlist popular support to the exertions of the Government. In the five months preceding the Armistice 200,000 men were recruited, and had the war gone on this number would have been greatly increased. In the spring of 1917 the Legislative Council had accepted the Government's proposal to make a free gift of £100,000,000 to the home Government towards the expenses of the war. This was in addition to the obligation which the Indian Government had undertaken, to bear the normal charges of all troops on the Indian establishment sent overseas. In the Sept. session of 1918 the Legislative Council, by a large majority of the non-official members, to whom the decision was left, agreed to make a further contribution. It was to take the form of paying for a certain number of Indian troops employed outside India by the British Government, along with certain pensionary charges. Assuming that the war would last till 1920 the aggregate charge was estimated at £45,000,000. Actually, however, on account of the earlier ending of the war and the heavy cost to India of the subsequent Afghan War, the contribution was reduced to less than one-third of that sum.

In appraising the contributions and the sacrifices made by India to the common cause of the Empire, several factors which distinguish that country from the self-governing Dominions should be remembered. The first is the poverty of the general mass of the population, dependent on a precarious and primitive agriculture, without the stay of large industries, with little accumulated capital, unversed in modern ways of banking and investment, and wedded to the ancient habit of hoarding. Secondly, the fiduciary relation of the Government to the governed, making it reluctant to impose sacrifices on a dependent population, and ever conscious of the difficulty of finding revenue to meet the elementary needs of a civilized administration. Thirdly, the necessities of self-defence owing to untranquil borders and liability to invasion. During the war the life of the late Amir of Afghanistan alone averted this danger. Its imminence and gravity were proved by the Afghan War and the rising of the independent tribes which followed on the murder of Amir Habibulla in Feb. 1919. All these circumstances considered, the part borne by India in the war and the sacrifices made by her people for the common cause were by no means despicable. They are represented by an addition of over 230 crores to her rupee debt, the sending overseas of 800,000 combatants and 400,000 non-combatants, and the furnishing of food-stuffs and other supplies at the cost of much privation among the poorer classes. If the agriculturists as a body and some other sections of the community made money out of the war, the urban classes and the multitude of persons on small salaries and fixed incomes suffered greatly from the dearness and scarcity of food and clothing. Privation undoubtedly intensified the severity of an epidemic of influenza in the autumn and winter of 1919 from which 5,000,000 persons died. It was also a potent cause of the labour unrest, strikes, and labour unions that were a marked feature of industrial India during 1919 and 1920, and that reacted on the political situation in 1921.

*Reception of Montagu-Chelmsford Report in India.*—The Armistice in Nov. 1918 was the signal for general rejoicings in India, but ushered in a season of political strife and agitation which has proved very unfavourable for the peaceful introduction of the new constitution. The Montagu-Chelmsford report had been published in the previous July. Its publication widened the breach between the moderates and the extremists. The moderates, while affecting regret that the scheme did not go far enough, accepted it as a generous attempt to establish responsible institutions. The extremists rejected it as utterly inadequate to satisfy the claims and expectations of the country. In the Sept. session of the Legislative Council the report was referred for consideration to a committee of the non-official members and was approved by them, with certain qualifications, as affording a satisfactory basis for the constitutional development of India. Encouraged by this report, the moderate party held a special conference in Nov. at Bombay and accepted the general principle of the Montagu-Chelmsford scheme while urging that it should be enlarged in certain ways. On the other hand the National Congress, which had now become the organ of the extreme national party, wholly condemned the scheme at the Dec. meeting, demanded full provincial autonomy at once and asserted India's right to self-determination. Unhappily another controversy now arose which was fated to overshadow and prejudice the constitutional question by the passions which it kindled and the bitterness which it imported into the relations of the people to the Government.

*The Rowlatt Bill.*—The report of the Sedition Committee over which Mr. Justice Rowlatt presided had been before the public for some months and the intention of the Government of India to legislate in accordance with the committee's recommendations had been announced, without exciting much heat. In fact the impressive evidence which the report presented as to the existence of a revolutionary and anarchical conspiracy in Bengal and elsewhere and the ineffectiveness of the ordinary criminal law to deal with it, secured at first a favourable reception for the committee's proposals. But on the bills being published in Jan. 1919 a violent campaign was started against the report and its proposals by the nationalist press and nationalist politicians. The object of the principal bill was to reënact in substance the extra-judicial procedure for dealing with anarchical and revolutionary crime with which the Defence of India Act had equipped the executive and by means of which the Government of Bengal had at last got the upper hand of a very dangerous conspiracy. Its provisions were not to be put into force in any place unless the Governor-General in Council was satisfied of the existence there of anarchical and revolutionary movements and of the public safety being endangered by the prevalence of crime of that nature. The bill, however, was represented as an attack upon the popular liberties, an attempt to invent crimes, a monstrous engine of tyranny and oppression, the forerunner of a policy of reaction and an unmerited slur upon the loyalty and law-abidingness of the Indian people. The extremists made it the occasion of a trial of strength with the autocratic power. Even the moderates disliked it and thought its introduction inopportune and unnecessary. A whirlwind of excitement swept through the cities of upper India, a strange medley of ignorance and alarm, of political unrest and domestic discontents, of conscious exaggeration and mendacity. It was an epidemic of unreason, such as destroyed Walpole's Excise bill. Walpole stayed his hand because he saw that it would lead to bloodshed.

It is easy to be wise after the event, but had the Government of India realized the intensity of the opposition and foreseen the tragedy of Amritsar it is at least possible that they would have thought it prudent to bend, like Walpole, to the storm. In the Legislative Council the bill met with most determined opposition from extremists and moderates alike. The Government in vain made concessions—one being to limit the duration of the measure to three years—and only passed it by the official majority.

While the bills were before the Legislative Assembly Mr. M. K. Gandhi, a well-known social and religious reformer, revered in the Bombay Presidency as an ascetic and holy man, initiated a passive resistance movement. *Satyagraha*, as he termed it, meant insistence on truth and a reliance on soul-force. He deprecated violence while preaching disobedience to the laws. The distinction, however obvious to a mystic of his temperament, was disregarded, as he afterwards regretfully acknowledged, by his followers. The nationalists took the movement in hand and organized branch societies in the larger towns of Bombay and northern India. On the Rowlatt bill receiving the Viceroy's assent Mr. Gandhi announced a day of general mourning and cessation of business. On March 30 a *hartal*, or closure of shops, took place at Delhi, the mob came into collision with the police and deaths occurred. A wave of excitement passed over the Punjab. Disturbances marked by grievous excesses broke out in Lahore, Amritsar and other centres when news came that Mr. Gandhi had been forbidden to enter the province and sent back to Bombay under arrest. Between April 10 and 15 mobs were in possession of these and other towns in the central Punjab. Disorder assumed the character of open rebellion, definitely anti-Government and anti-British, communications were cut and the civil authority was only maintained by military force. Martial law was proclaimed in Amritsar on April 14, was extended subsequently to other districts, and was not finally withdrawn from every part of the province until June, although order was generally restored by the end of April. But the situation remained critical owing to the Afghan War, and it was thought prudent to run no risks.

*The Amritsar "Tragedy."*—On April 13 "the tragedy of Amritsar" occurred. In that city banks and other buildings had been pillaged and burnt and Europeans murdered. The civil officers, finding themselves powerless to cope with the mobs in possession of the city, called upon the military to restore order. Brig.-Gen. Dyer, the officer commanding, deemed it necessary in the course of his operations to disperse forcibly an unlawful assembly held in the Jallianwala Bagh. Nearly 400 persons were killed by the fire of his troops and probably thrice that number wounded. His action aroused intense indignation among Indians of all shades of political opinion and became the subject of most bitter controversy. Other incidents, such as injudicious orders and degrading punishments awarded by officers administering martial law, the general severity with which martial law was administered, the heavy sentences passed by the summary courts on persons convicted by them, the confinement for extended periods of journalists and politicians suspected of having instigated the disturbances, the exclusion from appearing in the courts of counsel from other provinces, formed materials for an impassioned attack by the nationalist party on the policy and conduct of the Punjab Government and its head, Sir Michael O'Dwyer, and was not allayed by the appointment towards the end of the year of the Hunter Committee to inquire into the disturbances connected with the Rowlatt legislation.

The Punjab was not the only province in which the *Satyagraha* movement led to disturbances. In Bombay the news of Mr. Gandhi's arrest at Delhi was the occasion of an immediate outbreak of disorder in Ahmadabad, the capital of Guzerat, and in neighbouring towns. The military had to be called in, but not before numerous acts of incendiarism and violence and some loss of life had occurred. The disturbances terminated on the arrival of Mr. Gandhi, who expressed great sorrow at the excesses of his followers and was allowed to address an enormous meeting and upbraid the people for their violence.

*The Afghan War, 1919.*—Distorted reports of the disturbed state of the Punjab and of the nature of the Rowlatt Act found their way to Afghanistan and led the new Amir, Amanulla, to conclude that an invasion of India might prove a solution of his domestic differences. The murder of his father, the Amir Habibulla, on Feb. 20 1919 had brought him to the throne. But his succession was disliked by powerful factions. An invasion of India might increase his popularity with the army and the anti-British party and would appeal to the religious fanaticism of his Mahommedan subjects, deeply stirred as it was by the humiliation and defeat of Turkey and by the British conquest of Mesopotamia. His plan was to start with an anti-British propaganda

in India, to incite the independent tribes to rise and to follow up their raiding parties with his Afghan regular forces. His designs miscarried. The frontier tribes were slow to move. Aggressive movements of his troops in the Khyber were countered by the rapid mobilization of the army in India early in May, the occupation of the Afghan advanced base at Dacca and the bombing by aeroplanes of Kabul and Jalalabad. By the middle of May the Afghans asked for a cessation of hostilities and threw out feelers for peace. Dilatory negotiations followed before the Amir could bring himself to ask for terms. In June he reluctantly accepted the conditions of armistice offered to him. In July his representatives attended a conference at Rawalpindi and on Aug. 8 a treaty of peace was signed. The terms proposed were lenient as the object was to reëstablish friendly relations with Afghanistan. The Amir lost his subsidy and the privilege of importing arms through India. Another article expressed the willingness of the British Government to resume friendly relations with Afghanistan, if in the next six months the Afghans proved by their conduct that they were sincerely anxious to regain its friendship. A concession to which the Afghan delegates attached much importance was conveyed in a separate letter, which officially recognized the freedom of Afghanistan from foreign control. Doubts have been expressed as to the wisdom of this concession. But control over the foreign policy of Afghanistan has always been nominal rather than real, and the withdrawal of the subsidy in itself implied the rescission of the reciprocal obligation. The policy embodied in the treaty has been slow of fruition. After many delays the Amir sent delegates to India in 1920 to discuss the basis of a permanent friendly agreement, and as a sequel to these discussions a British envoy proceeded to Kabul to confer with the Afghan Government. The progress of Bolshevism in the countries to the N. of Afghanistan and the overthrow of the state of Bokhara may have disposed the Amir to seek a renewal of friendship with the British power, but in 1921 nothing was settled.

*Waziristan Expedition.*—The Rawalpindi treaty did not end the troubles on the frontier. The independent tribes of Wazirs and Mahsuds, who occupy a large block of country S. of the Khyber line between Afghanistan and the British districts to the E., had risen in May at the instigation of the Afghans, raided the adjoining British districts and achieved some temporary successes over the tribal militia and levies by whom the border is policed. As their raids showed no abatement, the Indian Government determined to undertake the permanent pacification of the country. It was a serious undertaking, as the tribes could place some 30,000 well-armed men in the field, of whom a number had served in the Indian army. A strong force was assembled on the frontier in Oct. and an ultimatum given to the tribes. They were required to make reparation for damages, to surrender arms in specified amounts, and were informed that the Government intended to make military roads through their country and occupy certain positions. The Wazirs in the Tochi Valley were soon subdued, but the Mahsuds held out and fought with dogged obstinacy and great skill. There were two considerable encounters (on Dec. 21 1919 and Jan. 14 1920) in which the British casualties were heavy. In the end the Mahsuds accepted the terms imposed upon them and operations closed on May 7 1920. This frontier campaign is officially described as one of "unparalleled hard fighting and severity. The enemy fought with a determination and courage which have rarely, if ever, been met with by our troops in similar operations." They were well armed, and many retired regular soldiers and deserters from the Indian army and tribal militia were present in their ranks. It was later found necessary to occupy the central portion of the Mahsud country while road-making, one of the most pacifying influences, was in progress.

*Army Inquiry.*—The Indian Government suffered both in purse and in military reputation from the Afghan War. That war and the Waziristan campaign cost the Indian taxpayer £15,000,000. The hurried mobilization of a large army on the frontier at the beginning of the hot weather and the carrying out of operations in an inhospitable country during the hottest months of the year severely strained the war-worn military machine and revealed defects in its working. The hardships experienced by the troops and the shortcomings of the supply and medical departments provided material for press attacks on the Indian military system and a repetition of the Mesopotamian breakdown was freely predicted. An inquiry into the organization and administration of the army in India was overdue, and in the autumn of 1919 the Secretary of State appointed a committee, with Lord Esher as chairman, to undertake it. The committee visited India in the winter and reported in the following May. Their recommendations covered much ground, from the relations of the High Command in India to the War Office and the India Office, the duties and position of the commander-in-chief in the Government of India, the administration of the army in India as part of the armed forces of the Empire, to the pay and pensions of officers and men of the Indian army. Some of these recommendations raised large questions of policy. Others involved a considerable increase in the Indian military budget. The report was unfavourably viewed in India. It was thought to harbour a design to increase the control of the War Office over the military forces of India and to place them at the disposal of the home Government. The Legislative Council expressed these apprehensions in a series of resolutions which the Government of India undertook to lay before the Secretary of State. The Government of India also undertook to effect all possible economies in military expenditure.

*The Non-Coöperation Movement.*—In Dec. 1919 the scheme of constitutional reform became law by the passing of the Government of India (Amendment) Act. Its importance was signalized by the King's proclamation of Dec. 23, which dwelt in eloquent and arresting language on the political advancement conferred upon the Indian peoples, authorized the Viceroy to extend the royal clemency to political offenders in the fullest measure compatible with the public safety, and announced that the Prince of Wales would visit India to inaugurate the new constitutions. Unfortunately, the effect of these gracious words was marred by the excitement and racial feeling generated by the sittings in the Punjab of Lord Hunter's Committee which was then inquiring into the disturbances of the preceding April. The National Congress met at Amritsar and passed resolutions denouncing the Government's action in the Punjab, demanding the recall of Lord Chelmsford and condemning the reform scheme as disappointing and unsatisfactory. This hostility towards the administration and rejection of the reforms by the extreme section of the nationalists developed in the ensuing months into a definite "non-coöperation" movement organized by Mr. Gandhi. Mr. Gandhi had already identified himself with the grievances of the Indian Mahommedan community with regard to the terms imposed on Turkey by the Allies and the question of the Khalifat. In connexion with the "Anti-Peace Celebrations" Committee organized by the Moslem leaders he announced a *hartal* and days of mourning and exhorted his Hindu followers to support the Mahommedan claim that Turkey should be reinstated in the position it held before the war. The campaign was viewed with indifference by the vast majority of Hindus, but fell in with the nationalist policy of uniting the two communities against the Government. In the summer of 1920 the movement was strengthened by two events. The publication of the Hunter Committee's report, and of the correspondence between the Government of India and the Secretary of State regarding its findings, and the subsequent debates in Parliament renewed the bitterness and indignation which the Amritsar proceedings had aroused in India. About the same time the terms of the Sèvres Treaty became known to Indian Mahommedans and added flame to the Khalifat agitation. In Aug. Mr. Gandhi proclaimed in a letter to the Viceroy his adoption of non-coöperation as a remedy against a Government for which he retained "neither respect nor affection" on account of its "unscrupulous, immoral and unjust" action in the matter of the Khalifat and its failure to punish adequately the officials responsible for "the wanton cruelty and inhumanity" with which the disorders in the Punjab were suppressed. The end of this

strange and illogical movement was not yet in sight in the middle of 1921. Its effects had been greatest with the student class and with the extremists of the national party. Students temporarily deserted the colleges but returned after a few days' reflection. Attempts made by Mr. Gandhi and his Mahommedan associates to capture the Hindu University at Benares and the Aligarh College failed. Lawyers did not discontinue practising in the courts, and very few persons resigned their government posts or relinquished their titles and decorations. Nationalist politicians held aloof from the elections to the new Legislative Councils only to find that the moderates were installed in power. There was no dearth of candidates at the elections held at the end of 1920, and notwithstanding the efforts of the non-coöperators the number of voters was creditably large. But while the movement had not drawn to itself the middle and upper classes it would seem to have loosened authority to some extent and relaxed the sense of law and order among the masses. In some provinces the tenants were urged to withhold rent from the landlords in anticipation of the advent of *swardj* or national self-government outside the Empire, and agrarian disturbances in consequence resulted.

In Jan. 1921 the Duke of Connaught visited India in place of the Prince of Wales and inaugurated the new constitutions. The speeches delivered by him in opening the Legislative Assembly, the Council of State and the Chamber of Princes at Delhi, and the Legislative Councils of Madras, Bengal and Bombay made a deep impression. His earnest appeal, as an old friend of India, to all parties, British and Indian, "to bury along with the dead past the mistakes and misunderstandings of the past," struck a note which has found response in the proceedings of the new Legislatures and in the Indian press.

*End of Lord Chelmsford's Viceroyalty.*—On April 2 1921 Lord Chelmsford made over the office of viceroy to his successor Lord Reading. No viceroy had been more tried by circumstances beyond his control, and no viceroy had shown more steadfast courage, patience or devotion to the highest ideals of his great office. The era will be a landmark in the history of modern India. It saw India started on the road to self-government and admitted on equal terms to a partnership in the British Empire.

### Administration

The Government of India Act 1919 made great changes in the political structure and life of India. On Aug. 20 1917 the British Government announced in Parliament that their policy was that of the increasing association of Indians in every branch of the administration and the gradual development of self-governing institutions with a view to the progressive realization of responsible government in India as an integral part of the British Empire. Mr. Montagu, the Secretary of State for India, visited India in the ensuing winter and in association with the Viceroy, Lord Chelmsford, made investigations as to the reforms necessary to give effect to this policy. Their recommendations were embodied in a joint report on Indian constitutional reforms. The Morley-Minto reforms had enlarged the Legislative Councils, had introduced into them the elective element, and had given them greater powers of influencing the executive government in matters of legislation and administration. But the executive Governments, Imperial and provincial, still remained Governments of officials, responsible as such to Parliament and the Secretary of State, and not amenable to popular control in India. The annual estimates of revenue and expenditure were discussed in the Legislatures, but were not voted. An official majority in the Imperial Legislative Council secured the passage of taxation laws that might be required. Though in practice the provincial Governments enjoyed a large measure of independence, they were in theory subject in all respects to the orders of the Government of India, and their revenues and expenditure were an integral part of the general revenues and expenditure of India and, as such, controlled in amount and allocation by the Government of India. The system was highly centralized and could not be otherwise, since the central Government was responsible to the home authorities for everything that was done in India. An advance on the lines laid down in the declaration of Aug. 20 1919 involved a break with the past and a new departure.

*The Montagu-Chelmsford Report.*—The authors of the Montagu-Chelmsford report proposed that responsible government should be conferred on India by progressive stages, together with a substantial step towards its immediate realization. By responsible government they meant government by ministers primarily amenable to an elected assembly and in a secondary degree to an electorate. They recognized that India was not yet fit for responsible government in its completeness, that an electorate had to be created and that the experience of its representatives would be small. They proposed therefore to confine the first stage of the advance to the major provinces, and in these provinces to set up a dual form of government, generally known as "dyarchy."

The administration was to be divided into two parts, "reserved" subjects and "transferred" subjects. The former would be administered by the governor and his executive council, and the latter would be transferred to ministers chosen by the governor from amongst the elected members of the Legislative Council. In this way Indian ministers would be trained in the practice of responsible government. The two halves of the Government would deliberate together, but each half would be separately responsible for legislative and administrative action in its own field. The governor would be the connecting link between the two. He would assist and guide the ministers, but ordinarily would not direct action to be taken against their advice. The provincial Legislative Councils would be enlarged and given substantial elected majorities. Provincial finance would be separated entirely from Imperial finance. The provincial Governments were to have complete control over their own revenues and expenditure, after making each a fixed contribution to the central Government. They would enjoy a much greater measure of independence of the central Government in administrative matters, and their domain of action would be definitely marked out by a formal separation of functions or subjects appertaining to the central Government from those appertaining to provincial Governments. It was not proposed to introduce "dyarchy" into the Government of India. It was thought essential to retain the Governor-General in Council's responsibility to Parliament in the whole field of the central Government. There would be no "ministry" working side by side of the executive council, and no separation of central subjects into "reserved" and "transferred." The Imperial Legislative Council, however, would be replaced by a bicameral Legislature, consisting of a Legislative Assembly, in which there would be a substantial elected majority, and a Council of State in which the Government would have an official majority. Bills would require the assent of both Chambers, except that a bill certified by the Governor-General in Council to be essential to the interests of peace and order or good government which the Legislative Assembly refused to pass might be enacted by the Council of State alone. In the provinces the governors would be given a somewhat similar safeguard (in the form of a grand committee) against the refusal of the Legislative Council to pass essential legislation.

The Montagu-Chelmsford report left the question of the distribution of subjects into "central" and "provincial" and the subdivision of "provincial" subjects into "reserved" and "transferred" subjects to be separately worked out, as also the question of electorates and the franchise. Two committees, known as the Functions Committee and the Franchise Committee, were appointed by the Secretary of State to make the necessary inquiries in India. They submitted their recommendations early in 1919. The views of the Government of India and of the local Governments on the proposals of the Montagu-Chelmsford report and of the two committees were also obtained. A third committee inquired into the constitution and functions of the India Office and of the Secretary of State's Council. Various political associations in India sent delegates to England to place their views before Parliament.

*Joint Select Committee on the Bill.*—In July 1919 a bill embodying the Montagu-Chelmsford scheme, modified in the light of subsequent inquiries and information, was introduced into the House of Commons, read a second time and referred to a Joint Select Committee of both Houses presided over by Lord Selborne, which was appointed to consider it in the light of the criticisms and suggestions received after the publication of the Montagu-Chelmsford report. The committee examined nearly 70 witnesses of all shades of opinion and made important changes in the bill. These are explained in their report. They dealt at length with the political and administrative problems involved in the bill, made recommendations on a number of important matters which

are left in the Act to be dealt with by rules, and indicated the principles by which the authorities entrusted with the working of this novel and intricate system of government should be guided. Their report is a most valuable constitutional document and is indispensable to a study of the Act. The bill passed both Houses substantially as amended by the committee, and received the Royal Assent on Dec. 23 1919.

In their preliminary remarks on the bill the Joint Select Committee expressed themselves satisfied that the plan of the bill interpreted the declaration of Aug. 20 with scrupulous accuracy and that it was the best way of giving effect to the policy of the British Government. They approved the plan of a dual government or "dyarchy" for the provinces, but refused to adopt the proposal pressed upon them by Indian witnesses that it should be extended to the central Government. They considered it essential that, during this first stage of a measured progress towards responsible government, the central Government, except so far as it might be released from responsibility as regards subjects transferred to "ministers" in the provinces, should remain in undisturbed responsibility to Parliament and fully equipped with the necessary powers to discharge that responsibility. They also considered it essential that in the provinces, while the "ministers" should be given the fullest opportunity of managing the field of government entrusted to their care, the provincial governor in council, as regards the field of government in which Parliament continued to hold him responsible, should remain equipped with the sure and certain power of fulfilling that responsibility. They regarded it of the highest importance that the governor should foster the habit of free consultation between the two halves of his Government. But this should not confuse the duties or obscure the separate responsibility of each half. Neither should control or interfere with the other. Each should be given under the Act and rules adequate power to fulfil its respective charge.

The Joint Committee accepted with some alterations the proposals of the Functions Committee for the distribution of functions or subjects between the central Government and the provincial governments. The line of demarcation was sufficiently obvious as regards the great majority of subjects. The army and navy, foreign affairs, currency and coinage, the public debt of India, the civil and criminal codes, customs, income tax and other sources of all-India revenues, posts and telegraphs, are subjects which clearly appertain to the central Government. Administration of law and justice, police, prisons, local self-government, medical administration, public health and sanitation are the natural functions of a provincial Government. But there are border-line subjects and cases of overlapping for which provision had to be made. It was also necessary in respect of some subjects provincially administered for the central Government to retain an over-riding power of legislation. The subdivision of the corpus of provincial subjects into "reserve" and "transferred" involved the question of the extent to which the provincial administration should at the outset be made over to non-official control, and gave room for considerable diversity of opinion. Broadly speaking, subjects appertaining to law and order, police, the administration of justice, the ports, factory Acts, the provincial revenues, are retained by the official half of the provincial Government, while local self-government, public health and sanitation, the liquor and drugs excise, education (with minor reservations), and other similar social services are transferred to "ministers."

The Joint Committee closely considered the much-debated question of the allocation of the provincial revenues between the two halves of the Government. Was each to have its own sources of revenue which it would develop and extend? Or were the provincial revenues to form a common fund from which each side of the Government would help itself? The first method, known as that of separate purses, would tend to keep the two parts of the Government apart. The second or "joint-purse" method might generate frictions and disputes. The Government of India advocated the former. There was a strong body of opinion in support of the latter. The Joint Committee decided in favour of the "joint-purse." They were hopeful that the matter could be readily solved by the exercise of common sense and reasonable give and take, and that the governor would ordinarily be able to propose an allocation acceptable to both sides. If he failed to secure an agreement, he should be empowered to refer the matter for decision to such authority as the Government of India might appoint.

The committee gave much consideration to the constitution of the electorates and made a number of recommendations. The most important of these touched the vexed question of the separate representation of special classes and interests. The Montagu-Chelmsford report reluctantly conceded it to the Mahommedan community and the Sikhs, and refused it to other classes. The Franchise Committee proposed its extension to Europeans and Anglo-Indians in certain provinces and to native Christians in Madras. The Joint Select Committee further extended it to the non-Brahmins in Madras and the Mahrattas in Bombay. They also recommended increased representation by means of nomination for the depressed classes and special provision for the representation of landholders and of Europeans in Bengal. The electoral system is largely coloured by the principle of separate representation of classes and interests.

The Joint Committee dealt as follows with the difficult question of the relations of the provincial governor towards his Legislative Council when it reduces or withholds supply asked for, or refuses to pass laws proposed by his Government. As regards supply the committee considered that the governor should have power to restore the provision made in the estimates for a "reserved" subject, on his certifying that the amount asked for was essential to the proper administration of the subject. With regard to legislation the committee rejected the expedient of referring a bill relating to a "reserved" subject which the Legislative Council had refused to pass to a Grand Committee, and recommended that the governor should have power to pass the bill on his sole authority on certifying that it was essential for the discharge of his responsibility. An Act so made was to be reserved for the King's assent.

With regard to the clauses of the bill relating to the Government of India the Joint Committee transformed the Council of State from a chamber in which the Government would have had an official majority into a real second chamber, having a majority of members returned by some method of election. They proposed that the governor-general should be empowered to pass on his sole responsibility Acts which the Legislature had refused to enact, on his certifying that the law was essential for the safety, tranquillity or interests of British India. They recommended that the Legislative Assembly should be elected directly by suitable constituencies, and not by the indirect method proposed by the Franchise Committee; that the Indian budget (certain charges being excepted) should be submitted to its vote, but that the Governor-General in Council should have power to restore any demand which the Legislative Assembly had refused, on certifying that it was essential to the discharge of his responsibilities. This power was meant to be real and to be used if and when necessary, since no measure of responsible government was to be introduced into the central administration. The committee considered that the governor-general should not be a member of, though he should have the right of addressing, either Chamber. He should appoint the president of the Legislative Assembly during the first four years, after which time the Chamber would elect its own president. The governor-general should also appoint the president of the Council of State from among its members. The first president should be qualified by experience in the House of Commons and knowledge of parliamentary procedure, precedents and conventions. Minor changes were made in the composition of the executive council. The limit on the number of its members was removed. Three members must be public servants, or ex-public servants, having not less than ten years' experience in the service of the Crown in India, one member should have definite legal qualifications, and not less than three members should be Indians.

With regard to the India Office the Joint Committee accepted the recommendation of Lord Crewe's committee that there should be a high commissioner for India, to be paid out of Indian revenues, who would perform for India functions of agency, as distinguished from administrative and political functions, analogous to those performed by the high commissioners of the self-governing Dominions. They agreed that all charges of the India Office, not being "agency" charges, should be paid out of money to be provided by Parliament. They were not in favour of the abolition of the Council of India, differing in this respect from the Crewe committee. But they recommended the introduction of more Indians into it, and the shortening of the period of the service upon it so as to ensure a continuous flow of fresh experience from India. The period has been reduced from seven to five years.

The Joint Committee made a highly important pronouncement on a question of great practical moment. Under the new constitution, notwithstanding the creation of an Indian Legislature deriving its authority from a large electorate, with a large elected majority and with enlarged powers, the responsibility of the Governor-General in Council to Parliament will remain statutorily unimpaired. This responsibility is enforced through the Secretary of State for India. In the past Secretaries of State have not hesitated to require the governor-general to carry out a policy approved by Parliament, or by powerful interests in Parliament, in opposition to the views of the Indian Government and of the Indian people. Especially has this been the case in tariff questions, where the Indian Government has sought to impose customs duties on cotton piece-goods and other imports in which the British manufacturer is interested. Is intervention of this kind to continue, or, in view of altered circumstances, should it be restricted by statute or convention? The committee considered that no statutory change could be made, but that it should be an understood rule that only in exceptional cases should the Secretary of State intervene in matters of purely Indian interest, where the Indian Government and the Legislature of India were in agreement. In the particular case of fiscal policy they recommended that the Government of India should have liberty to devise those tariff arrangements which seemed best fitted to India's needs as an integral part of the British Empire. India should have the same liberty as Canada, South Africa, and Australia. The Secretary of State's intervention, when it does take place, "should be limited to safeguarding the international obligations of the Empire or any fiscal arrangements within the Empire to which H.M. Government is a party." If future Parliaments abide by the convention which the Joint Committee have suggested and do not force the hands of

the Secretary of State, a potent cause of friction and misunderstanding between India and England will be removed.

A similar rule should, the committee considered, regulate the relations of the Government of India to provincial Governments so far as reserved subjects are concerned. Where the provincial Government and Legislature are in agreement, their view should ordinarily be allowed to prevail. Over transferred subjects the control of the governor-general should be restricted within the narrowest possible limits.

Lastly, the committee recommended that during the next ten years no changes of substance should be made in the constitution. At the end of that period the working of the constitution should be examined by a statutory commission. They suggested the appointment of a financial commission to advise as to the principle on which contributions from the provincial Governments to the central Government should be adjusted. They attached the greatest importance to the formation in each province of a strong department of finance which would serve both sides of the Government alike. They ended a notable report by an emphatic repudiation of the suggestion that the proposed constitutional changes implied any condemnation of the present system of Government in India.

*Government of India Act, 1919.*—The bill on which the Joint Committee reported became law as The Government of India Act, 1919. It takes the form of amendments of the Government of India Act, and has been so drafted as to admit of being textually incorporated into the principal Act. Its provisions are best studied in the Act of 1915 as now amended. As is usual with statutes relating to India, it left a great deal of the new constitution to be worked out by rules. In indicating in their report the lines which the rules should follow, and subsequently when rules had been made by the Government of India and had been laid before Parliament by the Secretary of State in examining and reporting on them, the Joint Select Committee have largely controlled the ultimate form of the new constitution.

"*Dyarchy.*"—The distinctive feature of the new constitutional system is the introduction of dual government or "dyarchy" into the major provinces. But preparatory to that two other steps required to be taken. In the three provinces known as Presidencies the form of government was that of a governor in council. The new system necessitated that the provinces known as the United Provinces, the Punjab, Bihar and Orissa, the Central Provinces, and Assam, which had hitherto been governed by lieutenant-governors or chief commissioners, should be raised to the position of "Governor's Provinces" and given each a governor in council.

In making this change the Act altered in one particular the composition of provincial executive councils. The maximum number of members is retained at four, but only one member (instead of two) must have been in the service of the Crown. Burma, the remaining major province, was left a lieutenant-governorship until a constitution adapted to its special needs could be devised. In the next place it was necessary to secure to the provinces a larger measure of independence of the central Government and a more assured field of action. Though in practice they enjoyed considerable freedom in the management of their domestic affairs, the Government of India, in virtue of their statutory right of control and intervention and concurrent powers of legislation, were always able, and were frequently compelled by their responsibility to the home authorities, to exercise powers both executive and legislative that cut across the considered action of the local Government. The same was the case with regard to provincial finance. The local Governments in practice were assigned by the central Government a very considerable share of the general revenues of India, but the main sources of the provincial income were not under their sole control and they were in theory little more than collecting and disbursing agents of the Government of India. They could not raise loans for provincial objects or impose additional taxation. The Act of 1919 does not in express terms enlarge the autonomy of provincial Governments, but it gives ample power to make statutory rules to that end and indicates the matters for which any such rules should make provision. This power has been exercised. The functions of the provincial Governments have been demarcated from those of the central Government by means of classified lists of "central" and provincial subjects. Some account of the contents of these lists has already been given.

The provincial Governments have been allotted their own sources of revenue, the principle on which the allocation has been made being that revenues accruing in respect to subjects provincially administered go to the provincial Governments. Receipts on account of land revenue, stamps, excise, forests, belong to this category. The central Government by this arrangement loses the share of these revenues which it hitherto received, with the result that the revenues accruing in respect of subjects (such as customs, income tax, salt, opium) which it itself administers are insufficient for its requirements. The provinces are therefore required to contribute annually fixed sums to the central Government, amounting in the aggregate to 983 lakhs (about £6,500,000). It is hoped that in time the central Government may be able to reduce, and possibly to remit altogether, these contributions. The provincial Governments are required to bank with the central Government. In cases of emergency a provincial Government may be required by the central Government, with the sanction of and on conditions approved by the Secretary of State, to pay to the central Government a contribution in excess of the prescribed amount. The central Government has also power in an emergency to require a provincial Government to reduce temporarily its drawings on its balances. Each province is also required to maintain a famine fund of a prescribed amount. Subject to these exceptions and to the obtaining the sanction of the Secretary of State to certain classes of expenditure, the provincial Governments may expend their revenues and balances as they think fit. They may also raise loans for certain specified purposes and on prescribed conditions on the security of provincial revenues. With regard to taxation certain taxes are scheduled which a provincial Legislative Council may impose by law without the previous sanction of the central Government.

*Constitution of Provincial Governments.*—The field of provincial autonomy having thus been demarcated and enlarged, the Act proceeds to introduce responsible government in an elementary and tentative form into the administration. It provides for the appointment by the governor of ministers, who must not be officials and who must be elected members of the Legislative Councils, to administer "transferred" subjects and to hold office during his pleasure; and it directs that ordinarily the governor shall be guided by their advice. The Act leaves it to rules to determine what "provincial" subjects shall be transferred to the administration of the governor acting with ministers, to regulate the extent and conditions of such transfer and to provide for the allocation of revenues or moneys for the purpose of such administration. Under this rule-making power an elaborate division of the functions of provincial Government into "reserved" subjects, which are administered by the governor in his executive council, and "transferred" subjects which are administered by the governor acting with ministers, has been made. Mention has been already made of the subjects placed respectively into the two categories. Law and order, administration of justice, police, are, as might be expected, among the reserved subjects. Of the subjects transferred to unofficial control education is perhaps the most critical. The rules with regard to the allocation of provincial revenues and balances as between reserved and transferred services adopt the "joint purse" plan recommended by the joint committees. Other rules create in each provincial Government a finance department and assign to it duties analogous to those discharged by the Treasury in England. It is controlled by a member of the executive council. It is responsible for seeing that proper financial rules are framed and suitable accounts kept, it prepares the estimates, examines and reports on all proposals for the increase or reduction of taxation, lays the audit and appropriation reports before the public accounts committee, and generally acts as the financial conscience of the administration.

A minister holds office during the pleasure of the governor. In administering his department he is responsible to and should command the support of the Legislative Council. If he should fail to command it, he may see fit to resign, or the governor may replace him. The salary of a minister is the same as that of a member of the executive council, unless a smaller salary is fixed by vote of the Legislative Council. The number of ministers is at the discretion of the governor, but will probably vary from two to four. The ministers will be encouraged to act together as a ministry and also, as far as possible, in consultation and harmony with the official half of the Government, that is, the executive council. But each half is solely responsible for decisions on the subjects administered by it. The orders and proceedings of each part of the Government run in the name of the Government but also indicate from which part they emanate. In the Legislative Council one part of the Government is not bound to support the other by speech or vote, but should not oppose.

*Provincial Legislative Councils.*—The new Legislative Councils are more than double the size of the late Councils and have a much larger majority of elected members. The method of election is

direct, and the electorates are many times larger than the old electorates. The vote has been given to about five millions of the adult male population. On account of the necessity for providing for the separate representation of different communities, classes and interests, the formation of constituencies and allotment of seats to the several communal or class groups has been a complicated and difficult business. The Act leaves these and other matters connected with the franchise to be settled by statutory rules. It merely prescribes the minimum strength of each Council and the proportions of official to elected members. Not more than 20% of the members may be officials, and at least 70% must be elected. The rules fix the strengths of the several Councils as follow:—Madras 127 members, Bombay 111, Bengal 139, United Provinces 123, Punjab 93, Bihar and Orissa 103, Assam 53. In all the Councils the seats allotted to electorates exceed the prescribed minimum of 70 per cent. The Bengal Council for instance consists of 113 elected members, 20 officials and 6 non-officials nominated to represent special interests. A further analysis of the composition of the Bengal Council will show the extent to which the electorates are formed on a communal, class, or special interests basis. Of the 113 elected members 46 are returned by non-Mahommedan electorates, 39 by Mahommedan, 5 by European, 1 by an Anglo-Indian electorate, 5 by landholders, 1 by the university, and 15 by chambers of commerce and trade associations. The constituencies with few exceptions are territorial, the Mahommedan and the non-Mahommedan electors in each electoral area being placed on separate rolls and reckoned as separate constituencies. The franchise is based on a property qualification varying from province to province, such as the payment of a prescribed minimum of land revenue, or of income tax, or of municipal taxes; but in all provinces pensioned or discharged officers and men of the Indian army are entitled to a vote irrespective of the amount of their income or property. The rules further provide for the return of election expenses, and for the appointment by the governor of commissioners for the trial of election petitions, and define what shall be deemed to be corrupt practices. These provisions have been supplemented by an Act (The Indian Elections Offences Act, 1920) of the Indian Legislature. The governor is no longer a member and *ex-officio* president of the Legislative Council. But he is entitled to address it and for the first four years appoints the president. Thereafter the Council will elect the president from among its members. It elects from the outset the deputy-president. With regard to legislation the restrictions which debarred provincial Legislative Councils under the Morley-Minto scheme from making laws on certain subjects, except with the previous sanction of the Government of India, have in a measure been relaxed. But a fact of more consequence is that in the new Councils the elected members are in a great majority and that ministers, responsible to them, will initiate legislation. A large advance has been made in the matter of budget procedure. Under the Morley-Minto system the Legislative Councils could only pass resolutions that were not binding on the Government. Now the proposals of the local Government for the appropriation of provincial revenues and other moneys are submitted to the vote of the Legislative Council in the form of a demand for grants, and the Council may refuse its assent to a demand or reduce the amount. To this power there are important limitations designed to strengthen the hands of the executive. Certain heads of expenditure are not submitted to the Legislative Council, on the analogy of the Consolidated Fund, and power is given to the governor to restore grants asked for in respect of reserved subjects which have been refused, and to authorize expenditure in an emergency.

*Duties and Powers of Governors of Provinces.*—The powers of the governor with regard to bills are important and somewhat intricate. He may stop proceedings on a bill by certifying that it affects the safety or tranquillity of his province or of another province. He may withhold his assent from a bill, or return the bill to the Council for reconsideration. Certain bills he is required by rule to reserve for the consideration of the governor-general, and others, as specified in the rules, he may so reserve. He may pass on his own responsibility a bill which the Legislative Council has refused to pass, if it relates to a reserved subject and he certifies that it is essential to the discharge of his responsibility. In accordance with the recommendation of the Joint Select Committee a bill so passed is subject to disallowance by His Majesty in Council. The governor of a province is thus the pivot on which the whole system of dual government turns. As Governor in Council he is the head of the official Government, and as such responsible together with his executive council to the Secretary of State and Parliament, and subject to the authority of the Government of India. In administering reserved subjects he and his executive council have to live on terms with a Legislative Council in which elected members are in a large majority, and to deliberate with ministers who reflect the dominant views of that body. In acting with the ministers his duty is to assist them in their administration of transferred subjects and advise them with regard to their relations with the Legislative Council. He has to have regard to these relations and to the wishes of the people as expressed by their representatives in deciding whether to accept or dissent from a minister's advice. Further, the Instrument of Instructions which he receives on appointment, while requiring him to act in all things so that the people may soonest be fitted for self-government, specially charges him to see that the safety and tranquillity of the province are maintained and religious and racial conflicts prevented; that minorities and depressed classes are not oppressed or their interests overlooked; that no one is deprived of rights and privileges hitherto enjoyed; that members of the public service are safeguarded in the legitimate exercise of their functions and justly treated; and that no monopolies or special privileges against the common interest shall be established. The governor's responsibility extends over the whole field of provincial government.

*Constitution of Central Government.*—The decision that no measure of responsible government should be introduced into the central administration left only the question of the changes to be made in the structure and powers of the Indian Legislature. The Act of 1919 has substituted for the single Chamber known as the Imperial Legislative Council a bicameral Legislature consisting of a Council of State and a Legislative Assembly. The old Chamber consisted of 68 members of whom 36 were officials. Of the 32 non-official members some were nominated and others were elected by very restricted electorates and indirect methods of voting. The new Legislative Assembly consists of 144 members of whom 103 are elected. Of the 41 nominated members 26 are officials. The Upper Chamber or Council of State consists of 60 members of whom 33 are elected, and 27 nominated. Not more than 20 of the nominated members may be officials. The executive Government is therefore not assured of a majority in either Chamber and it has been necessary to provide safeguards to enable it to pass essential legislation and to obtain supplies.

The Act leaves to statutory rules the apportionment of the elective seats of each Chamber among the provinces, the formation of constituencies, the qualifications of the electors and the like. Rules have been made on these subjects. The apportionment of seats is arranged with regard to the relative size and importance of the several provinces. To the province of Bengal 17 seats in the Legislative Assembly and 6 seats in the Council of State have been allotted. Smaller provinces have a smaller representation. The Punjab and Assam, for instance, are given 12 and 5 seats respectively in the Legislative Assembly and 3 and 2 seats in the Council of State. The method of election to both Chambers is direct. The constituencies have been formed on the communal and special interests' lines adopted in creating electorates for the Provincial Legislative Councils, though they are necessarily larger in area and the property qualification of voters is substantially higher. The province of Bengal for instance is divided into communal and special electorates which return 6 non-Mahommedan and 6 Mahommedan members, 3 Europeans, 1 representative of the landholders and 1 representative of Indian trade, to the Legislative Assembly. The province also returns to the Council of State 3 non-Mahommedans, 2 Mahommedans and 1 European by means of electorates which are similarly constituted, but which are very extensive in area and based on a restricted franchise.

The governor-general is not a member of, but may address, either Chamber. The members of his Executive Council are appointed members of one or other Chamber as the governor-general sees fit, but may speak in either Chamber. The governor-general nominates the president of the Upper Chamber, as also for the first four years after the constitution of the Chamber the president of the Legislative Assembly. After that period the Lower Chamber will elect its own president. The normal lifetime of the Council of State is five years and of the Legislative Assembly three years, but either Chamber, or both simultaneously, may be dissolved at any time by the governor-general.

*The Indian Legislature.*—The powers of the Indian Legislature may now be considered. As regards the asking of questions and the moving and discussing of resolutions concerning matters of general public interest the two Chambers of the Indian Legislature have substantially the same powers as their predecessor, the Imperial Legislative Council, and are subject to the same restrictions. But two minor enlargements may be mentioned. A supplementary question may be asked by any member of the Chamber; and a motion for adjournment of the business of the Chamber for the purpose of discussing a matter of urgent public importance may be moved with the consent of the president. A resolution if passed, has, as before, effect only as a recommendation to the Governor-General in Council. But the political effect may now well be greater in view of the altered character of the Legislature. With regard to legislation the Indian Legislature is debarred, as its predecessor was,

from legislating on certain specified subjects except with the previous sanction of the governor-general. To the creation of a second chamber and the possibility that the Government may be placed in a minority in either chamber are due certain provisions in the Act of 1919 which are not in the former Act. If the Chambers fail to agree to a bill within a period of six months from its passage by one Chamber the governor-general may refer it to a joint sitting of both Chambers. He may stop proceedings on a bill or prevent its introduction by certifying that it affects the safety or tranquillity of the country. He may pass a bill on his own responsibility which the Legislature has refused to pass, on certifying that its passage is essential for the safety, tranquillity or interests of British India or any part thereof. Any such Act is laid before Parliament and has no effect until it has received His Majesty's assent. The budget procedure prescribed by the Act of 1919 is novel and is an extension of the financial powers hitherto enjoyed by the Legislature. The Indian Councils Act of 1909 authorized the making of rules permitting the discussion in the Legislative Council of the annual financial statement. Under these rules resolutions might be moved and adopted concerning entries in the statement, but no vote was taken on the estimates and resolutions operated merely as recommendations. The Act of 1919 requires that the proposals of the Governor-General in Council for the appropriation of revenue or moneys (certain specified heads of expenditure excepted) shall be submitted to the vote of the Legislative Assembly in the form of demands for grants. The Legislative Assembly may assent or refuse its assent to any demand or may reduce the amount referred to in any demand by a reduction of the whole grant. But this formidable power is subject to limitations. The governor-general may restore a demand which the Legislative Assembly has refused to grant, by declaring that it is essential to the discharge of his responsibilities. Further the excepted heads of expenditure which are not submitted to the vote of the assembly include such important items as political and military charges and the salaries and pensions of certain classes of public servants, and constitute a large part of the budget. Of this arrangement, as also of the power given to the governor-general to pass a law which the Legislature has refused to accept, it is sufficient to say that they are solutions recommended by the Joint Select Committee of the dilemma raised by the coëxistence of an irremovable executive and elected Legislature, deriving their respective authority from different sources. They are not a final adjustment of forces but an expedient devised for a transitory stage of political development. The Act makes some minor changes in the number and in the tenure of office of members of the Secretary of State's Council and in the procedure of the India Office, but leaves the functions and constitution of the Council unaltered. A long-standing grievance is remedied by a provision placing the salary of the Secretary of State on the estimates and by an arrangement with the Treasury whereby the expenses of the Council of India and the India Office other than "agency" charges will henceforth be borne by the British Exchequer. By "agency" is meant work such as the purchase of stores, the engagement of persons for service in India, the payment of pay and pensions of Indian officers, in which the India Office acts as the agent of the Indian Government.

*High Commissioner for India.*—The Act authorizes the appointment of a high commissioner for India who will take over the agency business of the India Office with the necessary establishment, and transact it in direct communication with, and at the charge of, the Government of India. When this transfer has taken place the functions of the India Office will be purely administrative, and confined to those which strictly arise out of the duties of supervision, direction and control placed by Parliament upon the Secretary of State in Indian affairs.

*Restriction of Secretary of State's Powers.*—As a corollary to the introduction of the elements of responsible government into Indian administration the Act empowers the Secretary of State in Council to divest himself by rule, to such extent as he may specify, of his statutory powers of supervision and control over Indian affairs, and thereby, to like extent, of his responsibility to Parliament. In exercise of this power he has made a statutory rule which has the effect of releasing the administration of "transferred" subjects from his supervision and control, except in certain specified circumstances, such as, where Imperial interests or the interests of the Government of India are affected. Ordinarily he will not interfere, and will not be expected by Parliament to interfere, in subjects administered by members. This may be illustrated by a concrete instance. The administration of the liquor and drugs excise is a transferred subject. In the past the Secretary of State has constantly been called upon to intervene in respect of the district or provincial management of liquor shops and correct alleged abuses. In future his reply will be that the administration of this subject rests with the ministers responsible to the provincial Legislative Council, and that he is by rule precluded from interfering, unless it can be shown that the matter falls under one or other of the specified exceptions. A considerable area of Indian administration has in this way now been removed from the purview of Parliament. The rule-making power conferred by the Act extends in terms to central and provincial subjects as well as to transferred subjects. But the anxiety of Parliament to limit the exercise of the power to transferred subjects is shown by the provision that no rule applying to subjects other than transferred may be made until the draft has been approved by resolution of both Houses of Parliament. This is in consonance with the opinion of the Joint Select Committee that any relaxation of parliamentary control over that part of Indian administration which is still retained by the Governor-General in Council and the official Government in the provinces should come about by the growth of a convention and is not a suitable subject of rules.

*Position of Public Services.*—Two or three other matters dealt with in the Act of 1919 may be briefly noticed. The transfer of a considerable portion of Indian administration to ministers responsible to a Legislature, for the most part elected, necessarily affects the position of the public services and might, in the absence of statutory safeguards, injuriously affect their rights and privileges. The Act contains provisions securing to civil servants appointed by the Secretary of State (to which category the European services belong) protection against wrongful treatment or dismissal, and the enjoyment of pensionary rights granted to them on their appointment. The Act also establishes a Public Service Commission, with a chairman appointed by the Secretary of State in Council, to superintend the recruitment and to control the public services in India, creates the office of auditor-general and sets up a financial authority with adequate powers in each province.

*Statutory Commission.*—Lastly, the Act provides for the appointment of a Statutory Commission at the expiration of ten years to inquire into the working of the system of government, the growth of education, and the development of representative institutions in British India, and to report as to whether and to what extent it is desirable to establish the principle of responsible government, or to extend, modify or restrict the degree of responsible government then existing therein, including the question whether the establishment of second chambers in the local Legislatures is or is not desirable.

This provision sufficiently indicates the transitional and evolutionary character of the new constitutions set up in India. The progressive realization of responsible government has been declared the aim of British policy in India. If, as was announced, this policy can be carried out only by successive stages, and if the British Government and the Indian Government must be the judges of the time and measure of each advance, inquiry by a commission is a necessary measure. The undertaking given in the Act that inquiry shall be made ten years hence should disarm suspicions as to the intentions of Parliament and the British Government, and give assurance to honest workers in India. Impatient idealists may think the interval too long and may seek to abridge it. But the present advance means a long stride in an unmapped and difficult country, and ten years is as nothing in the growth of a nation. The interval will give opportunity for observation and testing such as were denied to the Morley-Minto reforms. The latter after barely four years' working were engulfed in the war and the inrush of new ideas. It will also give time for elementary education to become more general and for the electorates to comprehend the meaning and consequences of representative and responsible government.

*Subsidiary Administrative Reforms.*—The constitutional changes sanctioned by Parliament are to be supplemented in two directions by administrative measures which the Government of India has undertaken. They propose in the first place to revivify local self-government. Excluding the great presidency corporations, which are a class by themselves, Indian municipalities are largely under official guidance and control. The nominated element in the boards is large, and the chairman is often one of the district officials. "With the best intentions," say the authors of the Montagu-Chelmsford

report, "the presence of an official element on the boards has been prolonged beyond the point at which it would have afforded very necessary help, up to a point at which it has impeded the growth of initiative and practice." It is proposed to increase the elective element, to widen the municipal franchise, to replace official chairmen by elected chairmen, to give the boards greater financial and administrative powers, and to substitute control from without for control from within. The same policy is to be applied to the rural boards which even more than the municipalities are Government agencies. It is hoped in this way to make local affairs a training-ground for political work and to bring home to the people the realities and responsibilities of local self-government. In the second place the reconstitution of the public services is contemplated. They are to be "Indianized" in general accordance with the recommendations of the Royal Commission on the Public Services of India, as amplified by the Montagu-Chelmsford report. For the civil service of India, which is the administrative service of the country, the proportion of Indians has been fixed at 33 %, rising by 1½ % annually for a period of ten years to a maximum of 48 per cent. In the Indian educational service the proportion of Indians will be even larger. Some of the services which hitherto have contained a more or less considerable number of Europeans will in future be recruited entirely in India. Along with this change in the composition of the public services of India, their position and functions will undergo a change in consequence of the establishment of ministerial government in the provinces. Hitherto the greater services, and especially the civil service of India, have in practice had the administration in their hands and held the places involving superior control. They have formulated policy while being the executants of it. Under a system of responsible government this position will gradually change. They will be the executive agents of ministers who in their turn will be accountable to the Legislative Councils and the electorates. The authors of the Montagu-Chelmsford report have not overlooked the consequences of this change both as regards the recruitment and fortunes of the European members of the services and as regards the efficiency of the administration. But they take a sanguine view. They believe that to make the Indian people self-governing the presence of the English officer will be found indispensable, and while forbearing to forecast the future organization and disposition of the services, they consider that the English official will continue to play a large and useful part in the administration of the country.

*Constitution for Burma.*—The authors of the reforms scheme excluded Burma from the scope of their proposals and left the problem of its political evolution for separate and future consideration. They remarked that Burma was not India. Its peoples belonged to another race in another stage of development, its problems were altogether different, and it was impossible to say how far their proposals would be applicable to Burma until the Government and the people of that province had had an opportunity of considering them (Montagu-Chelmsford report, para. 198).

Acting on this suggestion the Government of Burma drew up and published for public discussion a tentative scheme of constitutional reform. After some delay due to this procedure the local government submitted to the Government of India in June 1919 its matured proposals, with a lengthy statement of its reasons for not recommending the application to Burma of the distinctive features of the constitution about to be given to India proper. Briefly speaking, the country was at present unfit for responsible government. The Burmans were politically a generation behind the people of India. They had not undergone the training in public affairs which had fallen to the lot of the latter. Municipal and local self-government in Burma were in their infancy. The elective principle was unfamiliar to the people. Comparatively few Burmans had an advanced knowledge of the English language and very few had attained to high office in the public service. The Indian constitution applied to Burma would result in an inexperienced electorate, a Legislative Chamber unequal to the responsibilities thrust upon it, and ministers with no administrative knowledge. The Burma Government therefore advocated a transitory scheme by which the people might be trained for the exercise of larger powers.

Instead of a dual Government, consisting of an official executive council and ministers drawn from and responsible to the Legislative Council, the Burma Government proposed that the head of the province, remaining autocratic, should be assisted in the administration by boards. Each board would consist of a non-official president nominated by the governor, to be chosen from the Legislative Assembly, and one or more official members. The boards would refer to the governor for decision cases in which the members were not agreed and cases of major or special importance. The boards would not be responsible in any respect to the Legislative Council. The methods of legislation would be similar to those in the provinces of India, but resolutions on the budget would be only recommendations to the governor. There would be no transferred subjects, no ministers and no responsibility to the Legislature.

The Government of India agreed with the Government of Burma as to the impossibility of imposing on Burma a constitution on the Indian model and as to the necessity for an intermediate period of preparation and training. In March 1920 they laid these views before the Secretary of State and asked for sanction to the scheme, which they said would give to Burma at least as great an advance as the disparity between it and India in political conditions warranted. In one important particular they modified, with the consent of the Burma Government, the original scheme, substituting for the proposed system of boards an executive council of three officials and three non-officials. The Executive Council would work in committees of two, so that the non-official Burman would have an official as his colleague and mentor. An appeal was to lie from a committee to the full council in case of a difference of opinion.

The decision of the Secretary of State was not announced until Nov. 1920. While this leisurely constitution-making was in progress, indifference in Burma had given place to a vigorous political agitation to secure for the province at least as ample a measure of responsible government as India was about to receive. In India "dyarchy" was in act of being established and the magnitude of the advance it implied was now realized. The Burman's pride was touched to the quick by the idea that it was proposed to put him on a lower plane than the Indians. He began to regard as an insult to his country and race the reform scheme which in 1919 Conservatives and Moderates had been disposed to accept. The rising feeling in Burma was patent to the Secretary of State when he refused to adopt the Government of India's proposals and informed them that His Majesty's Government had decided to apply the Act of 1919 to Burma. He based this decision on the ground that the Morley-Minto "training," which in substance was the same as the Indian Government's scheme, had proved "fallacious in India as a means of fitting Indians to exercise responsibility." He wished to avoid creating in Burma the situation which now threatened to prejudice success of reforms in India, and thought it better "to train Burmans in exercise of real responsibility rather than in criticism." The Government of India was perturbed by this decision. They replied that the immediate application of the Act of 1919 to Burma would be fraught with grave risks for which they could not accept responsibility, and urged that if it was decided to legislate, Parliament should be made acquainted with their views.

In March 1921 a bill to apply the Act of 1919 to Burma was introduced in the House of Lords. The debate on the second reading was adjourned until the House was in possession of the latest correspondence on the subject between the India Office and the Government of India. In the meantime the Secretary of State referred the whole correspondence to the Standing Joint Committee on Indian Affairs and asked them to advise him as to the form of constitution which should in their opinion be introduced in Burma. On the merits respectively of the Government of India's scheme and that of the Secretary of State the committee were divided. But they were at one in the conclusion that matters having gone thus far, Burma must be granted the same constitution as India. They had less difficulty in reaching this conclusion insomuch as the Burma Government, confronted with an agitation that had grown in intensity and strength since the intention of the home authorities had become known, telegraphed that the time had passed for pressing any scheme for an intermediate period of "training," and that the only course open was to extend "dyarchy" to Burma as soon as possible. The Government of India expressed similar views. Any scheme falling short of that adopted for provinces in India would, they said, no longer meet the aspirations of moderate Burmans. The acceptance of the bill was necessary.

In spite of the report of the Standing Joint Committee, and these strong expressions of opinion from Indian authorities hitherto opposed to the bill, it was found impossible by the Government to find time in 1921 for passing the Burma bill. It was decided, therefore, in August merely to proceed by notifying, under section 58a (1) of the Government of India Act, that it applied to Burma. It was then only necessary to settle the provisions of the franchise, determine the constituencies, divide the sphere of government into "transferred" and "reserved" subjects, and frame regulations on ancillary matters. It was hoped that the first elections to the Legislative Council would take place in 1922.

### Education

The census of 1911 showed that only 11·4% of the male pop. and 1·1% of the female pop. of British India were literate, according to a very modest standard of literacy. That is, under 6% of the pop. could read and write. The number of persons, male and female, returned as having an elementary knowledge of English was under a million and a half in a pop. (British India only) of 240 millions. Corresponding figures of the 1921 census were not available up to Aug. 1921, but it was believed that they would show a substantial advance. During the 10 years ending 1918 the number of persons undergoing instruction in colleges and schools increased by 50 per cent. In 1909 the number of students undergoing university education in arts and vocational colleges was 25,000, and in 1918 63,000; in secondary schools 800,000 in 1908 and 1,200,000 in 1918; in primary schools 4,420,000 in 1909 and 6,000,000 in 1918. These figures are for colleges and schools classed as public institutions. Adding to

them students attending special schools and private secondary and primary schools, the total number of persons under instruction was approximately 6,000,000 in 1909 and 8,000,000 in 1919. The increase would have been greater but for the deadly influenza epidemic which swept India in the latter year and carried off five millions of the pop., and which for some time would necessarily leave its mark on educational statistics.

Considerable as was the progress shown by the figures, the fact remained that only 5% of the male pop. and 1% of the female pop., or 3% of the whole pop., was undergoing instruction. If primary education were as general as in England, the percentage of males under instruction would be 15 instead of five. For India to approximate to the English standard (a standard which is possible only under a compulsory system), primary schools and teachers for three times the number of boys who were being taught would be necessary. This gives some idea of the magnitude of the task with which the educational reformer in India is faced. While primary education is thus so greatly in defect, the proportion of the population receiving university and secondary education compares well with the position in the most advanced Western countries. From the days of the East India Co. the demand of the middle class for education of this type as a means of livelihood has been insistent and increasing. It has been supplied by the State to the limit of its means on very cheap terms, to the comparative neglect of the agricultural and labouring classes who, where they were not actively hostile to the school-master, were well content to do without him. "While the lower classes," it is officially stated, "are largely illiterate, the middle class, which is the class that mainly patronizes higher institutions, is, numerically speaking, educated to a pitch equal to that attained in countries whose social and economic conditions are more highly developed." In Bengal the proportion of the educated classes who are taking full-time university courses is said to be almost 10 times as great as in England. But much of this so-called collegiate education is really school work of an indifferent kind. The danger of this top-heavy system is now fully realized. The local Governments, with the assistance of liberal grants from the revenues of the central Government, have lately adopted considered schemes for extending and improving primary schools and are laying the foundations of systematic advance. In several provinces arrangements have been made to double the number of places in the primary schools within the next few years. Public opinion in India was not ripe in 1921 for any general scheme of compulsory education. As a first step, municipal boards and other local bodies had been given by law in most provinces permissive powers to enforce the principle within their respective areas, but no great eagerness to make use of them had been shown.

During 1910–20 expenditure upon education in India had doubled. In 1919 it amounted to £8,500,000. Of this £3,600,000 came from general revenues, £1,100,000 from local funds, £1,500,000 from endowments and missionary enterprise, and £2,000,000 from fees. The charge upon general revenues was roughly 3½d. per head of the population. The local Governments may be expected to increase their educational budgets now that their finances have been improved under the new constitution and the department of education has been transferred to a minister responsible to the provincial Legislative Assembly. But the revenues of the provinces are not very elastic, the claims upon them are many, and fresh taxation in India raises many problems. Secondary and university education equally with primary education is in urgent need of a larger allocation of funds than is likely to be forthcoming in any province.

With the publication (1919) of the report of the Calcutta University Commission, higher education in India entered upon a new phase. The Commission was presided over by Sir Michael Sadler. It consisted of seven members, of whom four came direct from England and two were Indians. Its report condemned in emphatic and impressive language the whole system of secondary and university education, as it existed in Bengal, and, subject to qualifications, in other parts of India.

"The university system of Bengal," said the report, "is fundamentally defective in almost every respect." The system is based on an external examining university and a multitude of affiliated colleges, scattered throughout the country. The Calcutta University attempts to deal with 26,000 students. The numbers are beyond the capacity of a single university organization. The university is loaded with administrative functions which it cannot adequately perform. It rests on the assumption that the passing of examinations is the only thing of value in a university training. The examination standards are low and tend to lower themselves to the capacity of the weakest colleges. The scattered affiliated colleges are for the most part meagrely staffed and equipped; the teachers are gravely underpaid; the methods of instruction are mechanical; the conditions under which many of the students live are bad for their health, morals and work. The secondary or high schools which feed the colleges are even more defective, not only as regards teaching but in discipline, social life and healthy surroundings. Many are private-venture schools, managed for the gain of the proprietors at the lowest limit of efficiency. To pass their pupils into the university through the matriculation examination is their one aim. "The high-school training (dominated almost entirely by the matriculation examination), while it fails to fit most of the boys for the university, fails also in fitting them for anything else." With students entering the university so badly prepared, the teaching in the "intermediate classes" (that is during the two years between matriculation and the intermediate examination) is essentially school and not university work. The Commission would remove these classes from the university to "intermediate" colleges which, together with the high schools, would be placed under a Board of Secondary and Intermediate Education, independent of the university. The "intermediate" colleges would form the uppermost stage of a reformed and self-contained system of secondary education. Their curriculum would be of a varied kind and would lead up to appropriate examinations, conducted not by the university but by the Board, qualifying for entrance to the university, but also having an independent value as a certificate of general education. Students would enter the university at the stage at present represented by the intermediate examination and at a later age. The university would disencumber itself of two-thirds of the present unwieldy host of 26,000 students, and be set free for its proper duties.

The Commission rightly placed a radical reform of secondary education in the forefront of its proposals. As to the university, it would reconstitute it as a teaching university with a multi-collegiate organization, and give it a new constitution. It looked forward to the best of the affiliated colleges becoming in course of time independent universities. In the meantime, it would establish a teaching university at Dacca. Effect was given to this last recommendation, but the rest of the programme, involving an annual expenditure of £500,000 and a non-recurrent expenditure of an equal amount, remained in abeyance in 1921 owing to the financial difficulties of the Bengal Government. Other provinces accepted the principles of the report and proposed to apply them. The laws passed in the United Provinces for establishing teaching and residential universities at Lucknow and Aligarh (the Moslem University) bear unmistakable marks of the recommendations of the Commission.

### The Indian Army

The army in India is composed of British regular troops, which form part of the British army transferred for a period of service to the Indian establishment, and of the Indian army. The latter consists of Indian troops, raised in India by the Indian Government, and commanded by Indian officers (native officers as they are called) holding the viceroy's commission, and by British officers holding the king's commission. Under recent arrangements a certain number of king's commissions in the Indian army are now given to Indians; in some cases in recognition of distinguished service in the Indian army and by way of promotion, and in others to young men of good education on condition of their undergoing training in England at the Royal Military College, Sandhurst. The numerical proportion in which the two component parts of the army in India should stand to each other was fixed in the first instance in 1858, when the Crown assumed responsibility for the government and defence of India. It was further considered in 1893, when the rapid advance of Russia in Central Asia gave rise to anxiety for the security of India. The ratio of one British soldier to 2·5 Indian soldiers was then definitely adopted and has since been adhered to as the permanent basis of the army in India, though liable in emergencies, as in the World War, when India was for a time almost denuded of British troops, to be departed from. The proportion is struck on the regular forces, including the imperial service troops maintained by native states. No account is taken, on the one hand, of the Auxiliary Force, which is recruited on a voluntary system from the European and Eurasian community, or, on the other hand, of the reserves of the Indian army, the Indian territorial force, the armed police or the armies of the native states.

The British troops are necessarily the most costly part of the

army in India, and both on this account and from a sense of national pride Indian critics of military expenditure have pressed for a reduction in the British element. Up to 1921 the Indian Government and its military advisers, though committed generally to reducing army charges that have doubled since 1914, had not admitted that the British garrison could be safely reduced. In a debate in the Legislative Assembly in March 1921 the commander-in-chief (Lord Rawlinson) made out a strong case for not altering the proportion of British to Indian soldiers while the requirements of internal and external defence were unchanged.

In 1914, when the World War broke out, the regular forces in India comprised 75,575 British soldiers, including 2,689 commissioned officers; 159,861 Indian army troops, including 2,771 British commissioned officers and 341 British warrant and non-commissioned officers; and 21,069 Imperial service troops. The reserves of the Indian army numbered 36,000 odd. Many of these were found during the war to be unfit for active service. The Volunteer force consisted of some 38,000 Europeans and Eurasians. During the World War the Indian army was greatly enlarged, as demands were made upon it by the Home Government for service abroad. In the last year of the World War the Government of India undertook to raise an additional half-million combatant recruits, and no doubt the full number would have been raised had the Armistice not intervened. All charges were borne by the Home Government, but the heavy task of recruiting, training, equipping and despatching the new armies fell on the Indian administration. Demobilization commenced in the beginning of 1919, but was interrupted by the Afghan War and the subsequent campaign against the tribes in Waziristan. At the end of 1920 the Indian troops serving in India mustered 226,000 men, or some 70,000 above pre-war strength. The British troops on the same date were only 65,390 men, or some 14,000 below pre-war strength.

*The Kitchener Reforms.*—Lord Kitchener, in the course of his prolonged tenure of the post of commander-in-chief in India, set to himself the task of reconstituting the army in India as regards organization and administration, improving its military efficiency, distributing it territorially to the best advantage, and giving it the mobility and power of rapid concentration which modern warfare requires. Though able men before him had done much to make the Indian army an efficient instrument of war, Lord Kitchener brought to bear upon the problem new ideas and methods. He had this advantage over his predecessors that he enjoyed a prestige and authority that enabled him to override opposition and obtain the concurrence of the home and Indian authorities to a large, and, in many respects, a contentious, scheme of reconstruction. The abolition of the military department and the military member of council, and the subsequent suppression of a separate department of supply, made him eventually the sole military adviser of the viceroy, and concentrated in the person of the commander-in-chief all executive and administrative authority in military affairs. In reorganizing the army he made the defence of the north-west frontier against the possible advance of Russia through Afghanistan his primary concern. The organization of the troops which he found existing dated from the Mutiny. It failed, he considered, to distinguish sufficiently between the requirements of internal security and those of offensive warfare. It did not ear-mark troops for these two distinct purposes and train and equip them accordingly, but left the selection and mobilization of an active army in the event of war to the last moment. He aimed, therefore, at creating out of the forces at his disposal (some 230,000 men in all) a field army, capable of being immediately mobilized, of the strength which he considered would be required to defend India against a Russian advance through Afghanistan, until help could be obtained from England. He proposed to mark off this army from the troops allotted for internal defence, to distribute it conveniently by divisions (each division comprising some 13,500 combatants of all arms) in homogeneous military areas, and to train it in war formations under the general officers who would command in the field. He broke up the four army commands which he found existing and replaced them by nine "divisional" commands. In each divisional command he proposed to place a self-contained division of the field army together with the necessary complement of garrison troops that would be left behind for internal defence in the event of mobilization. Fully mobilized his field army would absorb some 120,000 combatant troops, or more than half the total [illegible] of the army in India. Adequate transport and supplies were to be provided and every arrangement made to enable each division of the field army, thoroughly trained and fully equipped, to pass rapidly into a state of war, when required, without confusion and dislocation.

It was a large scheme, involving many subsidiary reforms, such as enlarged staffs, extensive regrouping of troops and building of barracks, better training and equipment, increased pay and allowances for the native ranks of the Indian army.

These measures were in process of being carried out, when Lord Kitchener left India in 1909 after seven years' tenure of the office of commander-in-chief. Though planned with the greatest economy, and though it was curtailed and altered in order to reduce expense, the scheme necessarily increased the army charges, which rose from £16,000,000 in 1901 to £20,500,000 in 1910. Financial difficulties then beset the Indian Government. Fears of Russian aggression had subsided and a halt in military expenditure was thought advisable. When the World War broke out, the reorganization so far completed fell considerably short of Lord Kitchener's original scheme, though representing a great advance on what it had superseded. In the meantime much greater progress had been made in the United Kingdom in the organization, training and equipment of the British army. The expeditionary forces despatched from India were found in the earlier stages of the World War to be inferior in these respects to British troops. Then came the Mesopotamian breakdown, the inquiry of the Mesopotamian Committee set up by Act of Parliament, and the grave indictment of the Indian military system, as regards both administration and organization, contained in the Committee's report. The system was described as cumbrous, slow-moving and overcentralized in the last degree. The new commander-in-chief (Sir Charles Monro) effected some improvement, but the Afghan War of 1919, followed by the Waziristan campaign, led to renewed complaints against Indian army administration.

Under Lord Chelmsford's viceroyalty, the appointment of a Committee, with Lord Esher as chairman, to inquire into the organization and administration of the army in India, was deemed necessary. In the judgment of this Committee, which reported in 1920, the existing military system, as regards both organization and administration, was defective in many respects. Their recommendations would, if acted on, modify considerably the Kitchener scheme. Effect had already been given by 1921 to one such recommendation involving an extensive measure of delegation and decentralization. The nine divisional commands created by Lord Kitchener were replaced by smaller territorial units, and these were grouped into four army commands, the commanders of which would dispose of much work hitherto dealt with by the commander-in-chief and army headquarters. The more important proposals of the Committee regarding the functions of the military forces of India in any scheme of Empire defence, the authority to be exercised over their organization and administration by the British War Office, and the position and duties of the commander-in-chief were in 1921 still before the Indian Government and the Cabinet. As they stood, the proposals were not acceptable to Indian nationalists, who saw in them a design to subordinate the Indian army to the necessities of the Empire and to encroach on the independence of India.

### Finance

The Indian revenues are largely dependent on the seasonal rains. If the monsoon is bad, and the crops fail, land revenue is remitted or its collection postponed, railway traffics decline, the agricultural population consumes less, the customs and excise receipts fall off, and heavy expenditure is incurred in the relief of distress. Good and bad seasons occur in cycles. Lord Minto entered upon his administration in a good cycle. In 1905–6 there was a surplus of £2,000,000,[1] although the salt duty had been reduced, certain land cesses remitted and special grants made to local Governments from Imperial revenues. It may here be explained that the budget of the Government of India included also the transactions of the local Governments, the revenues enjoyed by the latter being mainly derived from sources of income which are shared between the Imperial or central Government and themselves. A grant from "Imperial revenues" to "provincial revenues" meant that the central Government from its surplus made a gift to the local Governments. In 1906–7 further remissions of land cesses and additional grants to local Governments were made and a surplus of £1,500,000 secured. In 1907–8 in expectation of continued prosperity the salt duty was reduced to the low rate of R.1 per maund (82 pounds), and the opium revenue precautionally written down in view of an agreement with the Chinese Government, under which the export of Indian opium to China would be progressively diminished until in the space of ten years it would altogether cease. But adverse times now set in. In the autumn of 1907 the rains failed over a great part of India. Conditions continued unfavourable throughout 1908 and the first

[1] The conversion of rupees into sterling throughout this article has been made on the basis of Rs. 15 = £1. This was the ratio, as fixed by Act of the Indian Legislature, up to Sept. 1920. It was effectively maintained in the exchanges, and was the accepted notation of the Indian Government in its financial and other returns. The ratio has now been altered to R.1 = 1/10 of the gold contained in a sovereign by the Indian Coinage Act, 1920, in accordance with the recommendation of the Indian Exchange and Currency Committee. But the new ratio failed to become effective, and no steps to stabilize it had been taken up to the middle of 1921. In the latest Indian returns the notation is in lakhs and crores of rupees. If and when a 2s. rupee becomes effective, a lakh will = £10,000 and a crore = £1,000,000.

half of 1909. In the year ending March 31 1909, the deficit exceeded £3,500,000. In 1909–10 equilibrium was only attained by the enforcement of severe economies. In 1910, the last year of Lord Minto's administration, additional taxation amounting to over £1,000,000 a year was imposed. The seasons again became favourable and Lord Hardinge succeeded to a full treasury.

The four years 1910–4 were years of financial prosperity. There was a large expansion of ordinary revenues, and also large windfalls under opium, due to the high prices which the Chinese were prepared to pay during the last few years of the trade. The accounts showed an "Imperial" surplus of nearly £4,000,000 in 1910–1, of equal amount in 1911–2, of over £3,000,000 in 1912–3 and of £2,330,000 in 1913–4. But the surpluses were really larger, as in the revised estimates of each year special grants for education and public health were made to local Governments, aggregating over £6,000,000 in the four years. The wisdom of special grants or "doles" from the surplus revenues of the central Government to the local Governments for expenditure on specific objects has been questioned, as encouraging extravagance and undermining the financial responsibility of local Governments. But they were a natural feature of the interlocking of provincial and Imperial revenues which then existed and of the control exercised by the Government of India over the whole field of provincial administration. Under a centralized system they were probably the most effectual instrument for promoting the active policy in public health and education that Lord Hardinge had at heart, and fell in with the ideas of the Indian members of the Imperial Legislative Council.

With the outbreak of the war in 1914 Indian finance entered on a difficult and anxious period. At first direct expenditure on the war was small, being limited to bearing the normal cost of troops belonging to the Indian establishment who were employed out of India in the different theatres of war.

The pre-war budget for military services was about £20,000,000 a year. This figure slowly rose to £25,000,000 in 1916–7 and £29,000,000 in 1917–8. In 1917 the financial position was sufficiently strong to justify the Indian Government, with the warm assent of the Legislative Council, in making a contribution of £100,000,000 to the home Government towards the cost of the war. In Sept. 1918, in the belief that the end of the war was distant and the needs of the home Government great, the Legislative Council, by a large majority of the non-official members to whom the decision was left, approved the Indian Government's proposal to make a further contribution. The Indian Government proposed to bear the cost of additional troops raised in India and of certain pensionary charges, the whole estimated at a sum of £45,000,000. Later estimates reduced the amount to £31,700,000. In 1920 the Legislative Council reconsidered the matter and recommended that the cost of the Afghan war should be deducted. The Government of India acquiesced, and the actual contribution was reduced to a sum of about £14,000,000. During the first two years of the war it was judged politically advisable to maintain the pre-war standard of taxation and incur a deficit of £3,000,000. In 1916–7, additional taxation, estimated to yield £3,000,000, was imposed. The income tax and salt duty were raised, duties imposed on exports of jute and tea, and the import tariff, save as regards the important item of cotton piece goods, was revised. By that time public confidence had revived, trade was active—especially in the export of produce required for war purposes—and agriculture prosperous. The railway earnings were large, all other sources of revenue yielded well, and a surplus of £7,500,000 resulted. In 1917–8, in order to meet the interest charges and sinking fund of the £100,000,000 contributed to the British Government, further additional taxation estimated to yield £6,000,000 was levied. A super-tax on incomes was imposed, the export tax on jute was increased, and a small surcharge placed on railway goods traffic. The import duty on cotton piece goods was also raised from 3½% to 7%, the excess duty on local cotton manufactures being maintained at the lower rate. The latter measure evoked strong protests from Lancashire and led to an important debate in the House of Commons, resulting in an undertaking that the matter would be re-examined hereafter in connexion with the general fiscal policy of the British Empire. Though the war continued, such was the activity of trade and the general prosperity of the country that a surplus of £8,000,000 was achieved.

The budget of 1918–9 was framed to produce a modest surplus. During the year the expenditure was increased by £13,000,000 credited to the home Government as the first instalment of the additional war contribution. The receipts, however, under most revenue heads were good, and the deficit of the year was under £4,000,000. In order to balance the estimates of revenue and expenditure of 1919–20 an excess profits duty, estimated to produce £6,000,000, was imposed for one year only. The budget of 1919–20, however, was completely upset by war with Afghanistan and other unexpected military charges, and the accounts of the year showed a deficit of £15,750,000. The budget estimates of 1920–1 were made on a basis that has since been found fallacious and were much too sanguine. It was assumed that the "boom" in trade and a high rate of exchange would continue, and that the gain from exchange or, in other words, diminution of the home charges would be large. The balance of trade from being highly favourable to India became adverse and the rupee exchange dropped during the year from 2s. 6d. to 1s. 4d. The military expenditure was underestimated. Sufficient account was not taken of the increased working charges of the railways and the consequent diminution of net receipts. The general rise in the cost of the civil departments on account of revisions of salaries necessitated by high prices was not foreseen. This was frankly admitted by the finance member in his financial statement introductory to the budget of the current year (1921–2).

The budget of 1921–2 marked a new era in Indian finance. It was the first budget under the new constitution submitted to the votes of the Legislative Assembly. It is confined to the revenues and expenditure of the central Government only, as provincial finances have now been entirely separated off and made over to the local Governments. It is expressed in rupees and not in sterling. The sterling pound of Rs.15 has disappeared and the proposed new ratio of 2s. to the rupee has failed to become effective. Crores of rupees take the place of millions of pounds. But whereas the crore was formerly the equivalent of £666,000 it is now assumed to be, but at present is not, the equivalent of £1,000,000. Expressed in the new notation there was in 1920–1 a deficit of 11 crores instead of an anticipated surplus of 2 crores. The budget of 1921–2 recognized that the expenditure from various causes had definitely outgrown the revenue, and provided 19 crores of additional revenue by enhancement of the customs import duties, a surcharge on railway goods traffic, higher postal rates, and regrading of the income tax and supertax. The revenues and expenditure of the central Government in 1921–2 are estimated at 130 crores (£130,000,000 on the basis of a 2s. rupee). The military charges absorb 66 crores or more than one-half of the total income. They are more than double the pre-war figure. The cost of the British garrison and the pay and pensions of the Indian army have greatly increased and the standard of equipment is higher and more expensive. Military expenditure is one of the budget heads which are not submitted to the vote of the Legislative Assembly. But the subject has been raised in other ways in that body and is one about which there is a difference of view between the executive Government and the Legislature. To the Indian nationalist whose thoughts are concentrated on internal progress and who imperfectly appreciates the existence of external dangers, the cost of defence seems excessive. The possibility of material economies largely depends on the strength and composition of the forces to be maintained. The Government of India, while not pledging themselves to immediate reductions, have undertaken to make a searching inquiry into military expenditure.

Military expenditure apart, the features of the financial situation which gave cause for anxiety were the large amount of floating and short-term debt; the inflated note circulation and the heavy capital requirements of the railways and irrigation. In comparison with other countries the indebtedness of India due to the war is not oppressively great. Before the war India was in the happy position of having no "ordinary" debt, as opposed to debt incurred for capital expenditure on railways and canals, the interest on which was borne by those undertakings. During the war and up to the end of 1920–1 some 230 crores of fresh rupee debt (including floating debt) had been incurred, representing an annual charge of over 12 crores on account of interest. Against this burden, considerable as it is, may be set the impulse given by the war to industrial development, the productiveness during the war of all existing industries, and the rapid accumulation of capital.

*Currency.*—At the outbreak of the World War the Indian currency system had, for a "managed" system, reached a position of considerable strength. The legal currency is the rupee, the ratio of which to the sovereign was, until altered in 1920 on the recommendation of the Indian Currency Commission of 1919, fixed at 15 rupees to the sovereign. There is no free coinage of silver. The Indian Government purchases silver and coins rupees to meet the requirements of the country. The profit, which was considerable when the price of silver ranged from 23 pence to 30 pence the ounce, is placed to the gold standard reserve and invested in sterling securities in London, forming a reserve to be used to maintain the exchange value of the rupee. The gold standard reserve amounted to £23,500,000 in 1914. On March 31 1920, it was represented by securities of the estimated value of £36,300,000. The import of gold in the form of sovereigns or bullion was unrestricted, and sovereigns circulated at the legal ratio. A favourable balance of trade over a series of years encouraged the import of gold, and £70,000,000 had passed into circulation between 1900 and 1914. In 1914 the gold held by the Indian Government in England and India together amounted to £23,000,000. The exchange value of the rupee had become stabilised in close approximation to the legal ratio, any upward movement being checked by imports of gold and any downward movement being met by the Government of India selling drafts on its reserves in London. It may be mentioned that the policy and measures adopted by the Indian Government to maintain the exchange value of the rupee received the approval of the Royal Commission on Indian Finance and Currency which was appointed in 1913.

With the war the Indian currency system entered on a new phase. India was called upon to supply the British Government and the Allies with immense quantities of raw materials, manufactured goods and food-stuffs for war purposes, and also to provide funds in India and in countries where Indian troops were fighting. The Indian Government had therefore to disburse rupee currency to

very large amounts. The home Government repaid its debts by credits in London, but the Indian Government required money in India and the difficulty was to remit specie. Gold was unobtainable. Silver was scarce in the London and American markets. The Indian Government was therefore compelled to increase the note issue without a corresponding increase of rupees held against the notes. The security for such issues was provided by investment in British Treasury bills on behalf of the paper currency reserve of moneys lying at credit of the Indian Government in the Bank of England. The notes were convertible and their encashment drained away the reserve stock of rupees. The time drew near when either inconvertibility must be declared or silver obtained in large quantities for coinage. In April 1918 inconvertibility was all but reached when help came from the American Government. The circumstances in which the relief of India was achieved at the last moment through the sympathy, statesmanship and driving force of President Wilson were graphically described in a speech made to the English-speaking Union on Feb. 12 1921 by Lord Reading, who was at Washington at the time as special ambassador and on whom it fell to put the serious position of India, and the gravity of the consequences likely to result from suspension of metallic payments, before the American Government. Congress was prevailed on to pass the Pittman Act as an emergency measure. The Act enabled the Government to borrow from the Treasury the greater part of the dollar reserve of 375 million oz. held as security for silver certificates. The American Government as soon as it obtained this authority allowed the Indian Government to purchase 200 million oz. of silver dollars on very reasonable terms and accelerated the despatch of the metal to India. The news of the transaction reaching India in advance sensibly alleviated the situation and gave the Indian Government a welcome respite. From July 1918 onwards American silver began to arrive in large quantities and was coined into rupees. For some months the new money went out of the reserves as fast as it was coined, but by Dec. 1918 the convertibility of the note issue was secured. Between March 1915 and March 1919 nearly 120 crores of rupees (£80,000,000, converting the rupee at 1s. 4d.) were added to the circulation. The active circulation of notes in the same period rose from 60 crores to 150 crores. The rupees held against the note issue in the paper currency reserve in March 1919 amounted to 28 crores, the balance being covered by investments in British and Indian Government securities and by gold. This great expansion of metallic and paper currency in India has been accompanied by a general rise in prices and wages.

The price of silver in the London market rose with the demand for it, and with the gradual decline in the dollar exchange value of the pound sterling, from the pre-war level of 26 pence the oz. to 55 pence in Sept. 1917. From that time onwards it varied from a minimum of 45 pence to a maximum of 89 pence in Feb. 1920. This was followed at intervals by corresponding rises in the sterling exchange value of the rupee from the pre-war standard of 1s. 4d. to 1s. 8d. in May 1919 and 2s. 4d. in the following December. So great a departure from the Indian currency system based on the ratio of 15 rupees to the pound sterling gave rise to great difficulties. The Indian Government could no longer buy silver for coinage except at a heavy loss. The withdrawal of rupees for clandestine export by bullion dealers and speculators, or their melting down, became a profitable though illegal operation. The conversion into bullion of the rupee, when valued at one-fifteenth of the pound sterling, was profitable as soon as the price of silver touched 43 pence the ounce. Thus embarrassed, and in the belief that a higher price level for silver had come to stay, the Indian Government recommended and the Secretary of State agreed that the question of Indian exchange and currency should be referred to a strong committee sitting in London. The committee after a prolonged inquiry reported early in 1920. It recommended that the rupee should be correlated to gold, and not to sterling which by that time had depreciated in relation to gold and had no certain value, and that it should be given a new statutory ratio equivalent to one-tenth of the gold contained in a sovereign. This would give the rupee the equivalence of 2s. when the pound sterling returned to parity with the sovereign. The committee were of opinion that the price of silver expressed in pence would remain at a point that would make the retention of a 1s. 4d. rupee impossible unless the coin itself was diminished in weight or fineness. This alternative they rejected. In fixing the ratio at one-tenth of a gold sovereign they looked to the eventual return of the pound sterling to parity with gold. They thought that, having regard to the higher price levels of the world, India would still be able to maintain a favourable trade balance with a 2s. rupee, and that any consequent readjustment of rupee prices of Indian export staples would be to the advantage of the Indian consumer by acting as a drag on internal prices. The Indian Government accepted the committee's recommendations, which tallied with their own views. They announced their intention of legislating to establish the new ratio between the rupee and the sovereign, and for some months they endeavoured to maintain the exchange value of the rupee at that level by selling drafts on their resources in London to the amount of over £50,000,000. But economic forces proved too strong. Persons having money in India hastened to remit it to England now that the rupee commanded 2s. 6d. or upwards of sterling At the same time the export trade of India fell off. In common with other countries whose exports consist of raw materials India found the demand for its produce suddenly dry up. The favourable trade balance, on which the stability of the rupee exchange at the old rate of 1s. 4d. depended, gave place during the second half of 1920 to a large adverse trade balance which had to be liquidated by bills on London. Exchange persistently dropped from 2s. 6d. the rupee, which in the first months of 1920 roughly represented the parity of one-tenth of a gold sovereign, to below 1s. 4d. in the early part of 1921, and the price of silver receded to 32 pence the ounce. In Sept. 1920 the Indian Coinage Act established the new ratio. The Indian Government, while stoutly maintaining that the policy was right, acknowledged that their efforts to support exchange and make the new ratio effective had proved both costly and abortive.

In 1920 the Indian Government took an important step to put its note issue on a better footing. Before the war the amount of notes that the Paper Currency Office might issue on the basis of securities of the British and Indian Governments was restricted to 14 crores. During the war the fiduciary issue was extended by a series of emergency Acts to 120 crores. The Indian Paper Currency Amendment Act, 1920, embodies a new and more elastic principle. It allows notes to be issued without limit, provided that at least 50% are covered by metallic holdings. Of the securities for the fiduciary portion 20 crores may be rupee securities. The balance must be securities of the United Kingdom of no longer maturity than 12 months. The metallic holdings may be either in gold or silver, but the gold, with the exception of 5 crores, must be held in India, not in England. This location of the gold reserves gives effect to Indian opinion on the subject. A novel and useful provision is that notes to the amount of 5 crores may be issued against bills of exchange of a durance not exceeding 90 days. The Act contains also transitory provisions intended to bridge the interval within which these important changes are to be brought into effect. Taken in conjunction with the amalgamation of the three Presidency banks into an Imperial Bank of India (*see* BANKS AND BANKING) this measure should secure a large expansion of the note issue under safe conditions.

### AGRICULTURE

As two-thirds of the population of India live on agriculture, the prosperity of the country turns on the annual harvests to an extent unknown in western Europe. Irrigation in many parts of India protects an increasingly large area from the vicissitudes of the seasons; but speaking generally Indian agriculture is in the main dependent on the monsoon rains. An intense and widespread drought afflicted the greater part of India in 1896 and taxed all the resources of the administration to cope with the resulting distress. In 1900 and again in 1908 the monsoon failed badly over very considerable areas, causing great destruction of crops and cattle. From the latter date until the autumn of 1918 the country as a whole enjoyed a ten-year cycle of good rains and satisfactory harvests.

Until the outbreak of the World War the foreign demand for Indian produce—wheat, cotton, oil-seeds, jute, rice—was very active. Under this demand prices rose rapidly in India, to the gain of the agriculturist but to the detriment of the urban and labouring classes, and the result was provocative of much unrest and discontent. Indian politicians are inclined to look suspiciously on the export of grain, and to regard it as a " drain " on the food of the people. But over a series of years the net export of food grains has averaged less than 2% of the estimated total outturn. The effect therefore of the " drain " in normal years may easily be exaggerated. That the foreign demand has stimulated Indian agriculture and that the Indian peasant has benefited would seem beyond doubt. The irrigation colonies of the Punjab, where virgin soil yielded phenomenal crops of wheat during the decade, prospered exceedingly. Agricultural land fetched from £30 to £40 the acre and market sites along the railway from £200 to £300 the acre. The colonists absorbed vast quantities of specie,—especially sovereigns,—built spacious towns and substantial dwellings and indulged in a standard of living that from the Indian standpoint was luxurious.

The war introduced new factors. At first the foreign demand ceased. But soon the Allies turned to India for supplies for war purposes, and by 1916 their needs became so great that the Indian Government was obliged to undertake control of internal prices and restrict the volume and regulate the direction of export trade. Money poured into India for purchase of wheat, rice, jute and other commodities. In the interest alike of the Indian consumer and of the British Government and its Allies, it was essential to see that the country was not denuded of supplies, that prices were not forced up to extravagant heights, and that whatever surplus was available was utilized for war purposes, and did not find its way to the enemy or to neutrals. The need for caution was proved by what occurred in 1918. In 1917 there was a record wheat crop. In 1918 the monsoon failed and the harvests of all food grains were bad. A moderate estimate placed the deficiency of the year's harvests at 20 million tons or about one-fourth of the average yield. The control exercised by the Indian Government prevented extreme shortage, though it was necessary in 1919 to import 200,000 tons of wheat from Australia, and to divert to India a large part of the surplus rice crop of Burma. Generally speaking the war has enriched the Indian agriculturist and given a stimulus to agricultural improvements.

During the ten years preceding the war the agricultural depart-

ments in India were reorganized and strengthened. Each province has now a staff of experts. Much valuable work has been undertaken, though the difficulty of improving the methods employed by the mass of the cultivators is great. The departments have been successful in introducing improved seed and distributing it over large areas. Strains of wheat bred at the Central Research Institute at Pusa are said to yield an increased profit of £1 an acre. Long-stapled varieties of cotton have been introduced into Madras and the canal colonies of the Punjab. The improvement of jute, sugar cane, indigo and rubber has also been taken in hand. In recent years the growth of the coöperative movement has been notable. In 1909 the number of coöperative societies was under 2,000 with 180,000 members, with an aggregate share capital of £91,000 and loans and deposits of £380,000. In 1918 there were 24,395 societies with a membership of over one million, a share capital of £1,403,000, loans and deposits of £6,500,000 and a reserve of £727,000. The number of societies has since increased to over 32,000. The district societies are grouped round central societies, of which there are over seven hundred. These collect loanable capital and finance the affiliated societies. Nine-tenths of the societies are agricultural. The public confidence in the movement is increasing, as the proportion of loans and deposits from non-members has nearly doubled in four years and represents more than 30% of the total capital. In Madras the movement is extending rapidly among the depressed classes. In the Punjab figures available for 140 societies which have been in existence for ten years show that 28% of the members are now entirely free from debt, that over £100,000 of debt has been paid off, and that on the average 10 years of coöperation reduces the debts of a member by half. In all provinces coöperation is reported to diminish extravagance and litigation. Some societies have by-laws prohibiting certain specified forms of ceremonial extravagance. In Burma the principle of coöperation has taken firm hold of the people and the movement there is carried on by an almost entirely indigenous direction. In many parts of India the societies are working in close conjunction with the agricultural department. There are societies for the purchase of concentrated manures and agricultural implements; others for the sale of cotton The coöperative movement in India is still in its infancy; it has had its ups and downs, its failures and mistakes; it affects but an infinitesimal fraction of the population. But it seems to have the elements of vitality, and to be the most hopeful road to freeing the petty cultivator and landholder from indebtedness and to improving his crops.

*Irrigation.*—Up to the end of 1918–9 the total outlay on the great irrigation canals that are classified as productive works and charged to capital account was £38,000,000. In that year the total receipts from these works, including land revenue due to irrigation, amounted to about £4,900,000 and the total expenses, including interest, to £2,600,000, leaving a net return of £2,300,000 or 6% on the capital invested. There are also certain protective works of considerable magnitude, constructed for the protection of precarious tracts, the cost of which, amounting to about £7,000,000, has been charged not to capital but to the general revenues, as they are not directly remunerative. And there are also "minor" works, which in the aggregate have a substantial protective value. The three descriptions of canals irrigated some 25,000,000 ac. in 1918–9, and the area continues to increase rapidly with the development of irrigation on the recently constructed canals in the Punjab. It is in the western region of that province, where vast tracts of fertile land have for centuries lain waste from want of rainfall and where the great rivers which have given to the province its name are fed in the driest months by the melting snows of the Himalayas, that the greatest advances have been made and the most striking results achieved. The first of these desert canals, the Lower Chenab canal, is easily the most productive work in India. It irrigates 2,500,000 ac. and returns over 40% on the original outlay. The Lower Jhelum canal is of the same character, though the area it commands is less. It irrigates 800,000 ac. and gives a return of 20 per cent. The triple-canal scheme, the last link of which—the Upper Jhelum canal—was completed in 1915, is in magnitude, daring conception, and engineering difficulties the greatest irrigation work in India. As its name implies it consists of a series of canals. The first canal conveys the surplus water of the Jhelum river, a river which receives from the Wular Lake in Kashmir an unfailing supply of water in excess of local requirements, to the Chenab river. Another canal utilizes the upper waters of the Chenab, thus reinforced from the Jhelum, to irrigate a large tract between that river and the Ravi, and discharges itself into the latter river, which in its turn is enabled to feed a third irrigation canal. The combined system will eventually irrigate 1,750,000 ac. and return a net revenue of over 7% on a capital outlay of £6,000,000. Three other projects of the first magnitude are under consideration in the Punjab, and one of equal size and difficulty—the Sukkur barrage scheme—in Sind. Including these, schemes are under consideration or projected in the different provinces which are estimated to cost £40,000,000, irrigate 10,000,000 ac. and yield a return of about 7 per cent. The bearing of this development of canal irrigation in mitigating the effect of drought and increasing the food supply of India is obvious. It provides a surplus production for export in normal years and a reserve of food for the country in years of deficient harvests; and it gives an outlet for the population of older and more fully settled districts.

### Manufactures

The conditions of employment in Indian factories are regulated by the Indian Factory Act of 1912, which marked a decided advance upon the former law, although very inadequate if judged by modern ideas of factory legislation. It established a 12-hour day for men, a 10-hour day for women, and a 6-hour day for children in textile factories; prohibited night-work, and limited the use of mechanical or electrical power in the factory to 12 hours during any one day. India was represented at the International Labour Conference held at Washington in 1919, and the Indian Government is taking steps to bring its factory law into greater conformity with the principles approved by the conference. It is proposed to raise the minimum age-limit for child labour from 9 years to 12 years and the upper age-limit from 14 to 15 years; to establish a 60-hour week for all classes of factories; to give longer intervals of rest and make more stringent provision for the weekly holiday.

In the years immediately preceding the war the cotton mills, mostly in the Bombay Presidency, passed through a long period of depression, though the number of spindles and looms increased. Jute mills, which are concentrated at Calcutta and are mostly in English hands, enjoyed almost unbroken prosperity at the expense of Dundee. The Tata Iron and Steel Works and the Bengal Iron and Steel Co. managed to hold their own against strong competition from overseas. The provision of electrical energy for the numerous industries of Bombay city was taken in hand by another Tata company, with a capital of more than a million sterling raised entirely in India.

The war gave a notable stimulus to Indian industries and aroused great public interest in the industrial development of the country. The scarcity and dearness of foreign goods threw the country on its own resources, enabling existing industries to make abnormal profits and encouraging the growth of new industries. The production of cotton piece goods doubled and the export in 1917–8 was 86% over the pre-war average. The number of looms increased from 69,700 in 1908 to 106,000 in 1918. The value of manufactured jute exports was £35,000,000 in 1917–8 against £13,500,000 in the pre-war quinquennium. The Tata Iron and Steel Works and the Bengal Iron and Steel Co. produced 781,000 tons of steel and iron in 1918–9 against 305,000 tons in 1913–4, and their equipment has been greatly enlarged. The demand for tanned hides has led to an increase in the number of leather factories from 29 in 1908 to 322 in 1918. The number of rice mills increased in the same period from 202 employing 21,000 persons to 544 employing 46,000 persons. The production of woollen mills trebled and the capital invested increased sevenfold. These are some instances of the impetus which the circumstances of the war gave to Indian manufactures. It was reinforced by the establishment in 1917 of a munitions board for supplying stores to armies in the field and developing industries in India. The profits made during the war had encouraged the promotion of many new industrial ventures, some of them possibly not very well conceived. During 1919–20, 906 companies were floated with an aggregate capital of £183,000,000. Another indication of the rapid growth of capital in India and of the profits made from industries and agriculture during the war is to be found in the success which has attended the large issues of Government loans. As an outcome of the munitions board the Government of India at the close of the war appointed an industrial commission to take stock of the industrial state of the country and to consider in what ways the Government might best assist its development. As the result of an exhaustive survey the commission were impressed with the backwardness of India, its ill-equipment as regards fundamental industries, and the poor provision made for technical and scientific training. Their recommendations cover much ground, from the active participation of the State in industrial development, the establishment of an All-India scientific service with full laboratory equipment and investigating staffs, the grant of State aid to private enterprises, to improving the general conditions of labour in India and increasing its efficiency. To give effect to the policy recommended by the commission a Minister of Industries has now been added to the executive council of the Governor-General. Another important step has been taken in the amalgamation of the three Presidency banks into an Imperial Bank of India under conditions that will make for greatly increased banking facilities in the interior of the country.

### Commerce

During the ten years preceding the war the sea-borne trade of India greatly increased. For the five years ending 1908–9 imports of private merchandise averaged £75,000,000 a year and exports £108,000,000; the corresponding figures for the five years ending 1913–4 were imports £97,000,000 and exports £146,000,000. These figures exclude treasure. The balance which they show in favour of India averaged £49,000,000 a year in the latter quinquennium, or £52,000,000 including reëxports of foreign merchandise. Net imports of treasure during 1909–14 averaged over £25,000,000 a year, of which nearly £19,000,000 was in sovereigns or gold bullion. The figures reflect a series of good harvests, an active demand on other countries for Indian produce, and rising world prices. Of the gold imported, a portion found its way into the paper currency reserve, a portion no doubt was hoarded or used for jewellery, and a considerable portion passed into circulation. In some districts sovereigns

became common. Sixty-three per cent of the imports of private merchandise came from the United Kingdom. Cotton piece goods represented one-third of the imports, and of this trade the United Kingdom had nearly a monopoly, 98% of the white and grey goods and 93·5% of the coloured goods coming from it. Other large items in the imports were iron and steel, in which trade the United Kingdom's share was 60%; sugar, chiefly from Java and Mauritius; railway plant and rolling stock and iron and steel, chiefly from the United Kingdom. Of the exports 25% went to the United Kingdom, 10% to Germany, 7·5% to Japan and the United States respectively, and 6·6% to France.

The war at first brought the Indian overseas trade to a standstill. Exports to Central Europe, which had hitherto been a good customer of India's raw materials, ceased. The invasion of Belgium and the military preoccupations of Marseilles upset the oil-seed and groundnut trade. A great shortage of shipping arose. Indian importing houses closed their commitments in the United Kingdom for piece goods and other manufactures. But before long India began to adapt itself to war conditions. Jute cloth for sand bags, hides for army boots, raw wool and tea were exported in enormous quantities. Heavy shipments of wheat were made on Government account. Japan was a large buyer of Indian raw cotton, to be returned to India in the form of piece goods. In 1915–6 the export trade of India did extremely well, and better still in the following years. In 1918–9 the gross exports and imports of private merchandise exceeded the highest pre-war figures, being £169,000,000 and £113,000,000 respectively. This increase of value, however, was largely due to abnormally high prices, and was not accompanied by a corresponding increase in the volume of trade. The war also affected the distribution of this overseas trade. On account of shipping difficulties and the inability of English manufacturers to produce goods the United Kingdom lost part of its pre-war share of the import trade, and Japan and the United States gained at its expense. In 1918–9 the United Kingdom's share of India's imports had declined from the pre-war 64% to 46%, while the shares of Japan and the United States had increased from 2% and 3% respectively to 20% and 10%. Japan flooded India with cotton piece goods and with miscellaneous articles which formerly had been supplied by Germany and Austria. The United States supplied iron and steel work, railway material, motor cars and cycles, and machinery. The post-war course of Indian trade has been erratic. During the year ending March 1920 it was very active. The imports and exports of 1919–20 exceeded in value all previous records, and the balance of trade in favour of India was phenomenally large. Imports amounted to £132,000,000 and exports to £218,000,000. The exports of raw cotton and raw and manufactured jute, tea, oil-seeds and hides were notably large. In the import trade the United Kingdom recovered some of the ground which it had lost during the war, and its share rose from 46% in 1918–9 to 51%, the improvement being most marked under the heads of cotton piece goods, iron and steel, railway materials and mill work. Imports from Japan declined and the share of that country of India's imports fell to 9 per cent. In 1920–1 the trading prosperity of India experienced a serious setback. The foreign demand for Indian produce fell off and values declined in consequence of the severe industrial depression prevailing in the United States, Japan and the United Kingdom. The power of India's customers to purchase her produce was severely restricted, the export trade came to a standstill, and stocks of many of her commodities, such as hides and tea, accumulated. The import market became seriously overstocked. Encouraged by the high exchange value of the rupee during the winter of 1919–20 and by the great demand of the Indian population for cotton piece goods and other foreign commodities the importing houses placed large orders in the United Kingdom and America. Delays occurred in the execution of these orders, and when the goods reached India the Indian public was in no mood to buy, while the fall in the exchange value of the rupee from 2s. 7d. to 1s. 4d. placed importers who had not taken the precaution of "covering" exchange in serious difficulties. As a result of these untoward events the unprecedented balance of trade in favour of India in 1919–20 was replaced in 1920–1 by an adverse balance. There is, however, nothing inherently wrong in India's commercial position. A country which is a large producer of important raw commodities, such as wheat and other food grains, jute, cotton, oil-seeds and hides, for which in normal years there is a world-wide demand, should be among the first to feel the effect of restoration of credit and industrial revival in the suffering nations of Europe.

### Railways

From 1908–9, in which year there was a net loss to the State on the railway account in consequence of the failure of the monsoon, up to the outbreak of the war, the railways fully participated in the prosperity which a series of good harvests produced. The goods and passenger traffic, the gross and net earnings, and the gain to the State steadily increased. There was a setback in the first year of the war, followed by an expansion of traffic and earnings. The net profit to the State, after meeting interest, annuity, sinking fund and working charges, was £4,000,000 in 1915–6, £7,500,000 in 1916–7, £10,000,000 in 1917–8, and £11,000,000 in 1918–9. Since 1918–9 increased working charges, due to higher wages, greater cost of fuel and heavy outlay on renewals have seriously eaten into the net profit of the State from the railways. The war placed a great strain on the Indian railway system, which, in addition to discharging India's own requirements, had to supply personnel and materials for the construction and working of military railways in Mesopotamia and other theatres of war. The constant movement of troops, and conveyance of supplies, munitions and stores for despatch overseas, caused a great increase of traffic. Ordinary passenger traffic and other civil needs had to give way to essential military requirements, and a central control department had to be created. The railways deteriorated in equipment owing to the scarcity of materials and rolling-stock. Since the war ceased, endeavours have been made to make good these arrears and bring the lines up to the pre-war standard. The 1919–20 budget provided £17,700,000 for capital expenditure, and a still larger sum was provided in 1920–1.

During the ten years ending 1918–9 the open mileage increased from 31,490 to 36,616. But for the war, and the necessity for applying after the war all available capital to the equipment of open lines, the increase would have been greater. The number of passengers carried on all Indian railways increased from 329,000,000 to 472,000,000, and the total weight of goods carried increased from 61,000,000 to 99,000,000 tons. The total capital outlay incurred by the Government up to the end of 1918–9 in the purchase and construction of State lines amounted to £370,000,000. The net traffic earnings represent a return of about 5½% on this capital.

The most important line of recent construction is that through Rajputana from Muttra to Kotah, affording communication between northern India and Bombay on the broad-gauge of the Bombay and Baroda system. The bridge across the Ganges at Sara in Bengal is a fine engineering work. It was opened in 1915 and carries the traffic from N. of the river, which was formerly ferried over, without trans-shipment to Calcutta.

The inadequacy of the railways to carry the increasing traffic and the scanty accommodation provided for third-class passengers have been the subject of much complaint. The substitution of State for company management, as working leases fall in, is favoured by Indians, chiefly on the ground that under State management their interests are more likely to be consulted and more openings made for them in the higher ranks of the railway service. Management by companies domiciled in India, on the boards of which Indians should be represented, has also been advocated. The matter came to a head in 1919 when, under the terms of the lease of the East Indian railway to an English company, the State might have terminated the contract and taken over the management. In deciding to allow the lease to run for a further term of five years the Secretary of State announced his intention of referring the general question of the future management of Indian railways to a committee. The committee (with Sir William Acworth as chairman) was appointed in Oct. 1920 and reported in 1921.

Authorities.—Among books bearing on the period the following may be mentioned:—Valentine Chirol, *Indian Unrest* (1910); Lovat Fraser, *India Under Curzon and After* (1912); Chailley, *Administrative Problems of British India* (1910); J. Ramsay Macdonald, *The Government of India* (1919); Gilchrist, *Indian Nationality* (1920); H.H. the Aga Khan, *India in Transition* (1918); Sir Verney Lovett, *History of the Indian Nationalist Movement* (1920); Lord Meston, *India at the Cross Ways* (1920); L. Curtis, *Dyarchy* (1920). For constitutional history see Ilbert, *Government of India* (1915); and for general history Vincent Smith, *The Oxford History of India* (1919). Lord Morley's *Indian Speeches* (1909) and his *Recollections* (1917) are useful for the Minto period. The collected Indian speeches of Lord Minto and those of Lord Hardinge have also been consulted. The annual review or year-book of Indian affairs (*Statement Exhibiting the Moral and Material Progress and Condition of India*) which the Government of India prepare for submission to Parliament is in its revised form a most useful State paper. The present series started from the year 1918. The Montagu-Chelmsford report on *Indian Constitutional Reforms* (1918) was published as a Parliamentary paper, as also was the subsequent correspondence regarding it between the Secretary of State and the Government of India. Other Parliamentary papers of special importance are the *Proceedings and Report of the Joint Select Committee on the Government of India Bill* (1919); the further correspondence regarding *Constitutional Reform in Burma* (1921); the *Report of the Hunter Committee on Disturbances in the Punjab* (1920), and of the Esher Committee on *The Army in India* (1920). For finance the *Report of the Indian Currency Committee* (1920) and the *Financial Statement and Budget* of the Government of India for 1920–1 and for 1921–2 should be consulted. With regard to education the *Report of the Calcutta University Commission* (Calcutta, 1919) is a document of the first importance. (T. W. Ho.)

**INDIANA** (*see* 14.421).—The pop. in 1920 was 2,930,390, an increase of 229,514, or 8·5%, over the 2,700,876 of 1910, as against an increase of 7·3% in the preceding decade. From ninth in rank among the states in 1910 Indiana fell to eleventh in 1920. Of the 92 counties in the state 28 show increases and 64 show decreases. The density in 1920 was 81·3 to the sq. m.; in 1910, 74·9. The urban pop. (in places of over 2,500) was 50·6% of the whole in 1920 as against 42·4% in 1910.

The ten cities of Indiana with a pop. of 30,000 or more were:—

| | 1920 | 1910 | Increase per cent |
|---|---|---|---|
| Indianapolis | 314,194 | 233,650 | 34·5 |
| Fort Wayne | 86,549 | 63,933 | 35·4 |
| Evansville | 85,264 | 69,647 | 22·4 |
| South Bend | 70,983 | 53,684 | 32·2 |
| Terre Haute | 66,083 | 58,157 | 13·6 |
| Gary | 55,378 | 16,802 | 229·6 |
| Muncie | 36,524 | 24,005 | 52·2 |
| Hammond | 36,004 | 20,925 | 72·1 |
| East Chicago | 35,967 | 19,098 | 88·3 |
| Kokomo | 30,067 | 17,010 | 76·8 |

The cities making the largest percentage of gain were in the northern part of the state, especially those near Chicago, like Gary, East Chicago and South Bend.

*Agriculture.*—During the decade 1910–20 the number of farms decreased from 215,485 to 205,126, or 4·8%. During the same period the acreage per farm increased from 98·8 ac. to 102·7; the value per acre from $84.94 to $144.44. The value of all crops rose from $196,869,691 in 1909 to $497,229,719 in 1919. The Indian-corn crop in 1909 was 195,496,433 bus., valued at $98,437,988, from 4,901,054 ac.; in 1919, 158,603,938 bus., valued at $229,975,713, from 4,457,400 acres. The oat crop in 1909 from 1,667,818 ac. was 50,607,913 bus., valued at $18,928,706; in 1919, from 1,718,748 ac., 52,529,723 bus., valued at $42,023,780. The winter wheat crop in 1909 from 2,080,879 ac. was 33,901,949 bus., valued at $33,559,918; in 1919, from 2,759,757 ac., 44,796,296 bus., valued at $97,207,962. The total value of domestic animals in 1920 was $244,164,616. The number of cattle reported was 1,546,095, valued at $94,529,884; of horses 717,233, valued at $66,703,216; of sheep 643,889, valued at $7,628,968; and of swine 3,757,135, valued at $63,095,220.

*Mineral Products.*—Instead of ranking fifth among the states in natural gas and sixth in petroleum, as in 1906, Indiana was in 1921 thirteenth in natural gas and twelfth in petroleum. The state still ranked sixth in coal, with greatly increased yearly output, valued at $70,384,000, the coal being bituminous. Indiana in 1921 was producing 27,000,000 tons of coal annually, with an annual rate of increase of 500,000 tons.

The large stone quarries of Monroe and Lawrence counties produce 70% of the limestone used in the United States for building. Indiana is the first state in this product; fifth in value of all stone sold. Indiana oölitic limestone is used in nearly every state and in foreign countries. The value of the limestone quarried in 1916 was $4,657,000, as compared with $2,553,502 in 1902. Indiana has valuable clays, shales, and kaolin, and is sixth among the states in ceramic production. Drainage tiles, encaustic tiles, fire-proofing, terra-cotta, sewer pipe and stove linings are other important clay products. Pottery products include earthenware, stoneware, white granite, semi-porcelain, sanitary ware and porcelain electrical ware. In 1916 and 1918 Indiana was the second state in the production of Portland cement, valued in 1918 at $12,525,000 as against $1,347,000 in 1903.

*Finance.*—The total true value of taxable property in the state, according to the tax levy of 1919, was $5,749,258,800, an increase since 1907 of nearly $5,000,000,000. This increase came partly by growth in wealth but largely by increased rate of assessment. The total taxes in 1919 for state, township and municipal purposes amounted to a little over $75,615,000, of which $21,205,434 was for tuition and special school funds. The assessed valuation was chiefly on real estate and improvements ($3,727,112,673); steam and electric railways ($660,794,291); telegraphs and telephones ($45,229,449); and express companies ($3,207,473). The debt of the state was less than $1,000,000.

*Education.*—In 1920 Indiana ranked third among the states in percentage of school children in attendance, the rate of attendance, however, being only 73%. The average annual expenditure per child attending school in 1918 was $53, the state ranking 28th in this respect. The average annual expenditure per person of school age (6 to 21 years) was $39. The salaries for teachers materially increased in the three years 1918–21. In 1921 the state increased the tax levy for common-school support as well as for the support of the higher educational institutions, and provision for teachers' pensions was enacted. There was a tax levy of five cents on each $100 of taxable property for the support of the three higher educational institutions of the state, producing about $2,750,000, and a levy of a fraction of a cent for vocational education producing yearly about $115,000. Nearly $50,000,000 is spent annually in Indiana for purposes of education, from local and general levies, counting from the primary grades to the universities.

*Constitution and Government.*—During the decade 1910–20 there was much discussion over amending the constitution of the state, a difficult undertaking under the provisions of the constitution of 1851. In 1914 a conference was held at the state university to consider whether a constitutional convention should be called. Out of this conference grew an organization of voters, the Constitutional Convention League, whose purpose it was to bring about such a convention. Under the influence of this League, while the Legislature refused to call a constitutional convention, it agreed to submit to the voters by referendum in 1916 the question whether such a convention should be held. The proposal was voted down by a large majority, partly because of the expense involved, partly from fear of radical innovations. The vote for the convention was, however, so large that the Legislature decided to submit to the people for a vote in Sept. 1921 13 proposed amendments.

These amendments provided: (1) that the term of office or salary of any officer fixed by law shall not be increased during the term for which such officer is elected; (2) that all county officers shall be elected for a four-year term and that the surveyor be eliminated from the elective list; (3) that prosecuting attorneys shall be elected for four years; (4) that negroes may be admitted to the state militia; (5) that the General Assembly may have power to classify the several counties, townships, cities and towns of the state and to enact laws prescribing a uniform method of registration; (6) that the General Assembly may provide by law for the qualifications of persons admitted to the practice of law (this amendment, pending for nearly 40 years, would do away with the extraordinary provision in the constitution that "every person of good moral character, being a voter, shall be entitled to practise law . . . in all courts of justice"); (7) that the Legislature may levy an income tax, providing for reasonable exemptions; (8) that the governor may veto specific items in appropriation bills, and that any such bill or item may be passed over his veto under the rules affecting ordinary bills; (9) that the state superintendent of public instruction shall be appointive; (10) that all elective state officers created by the General Assembly shall hold their offices for only four years (except judges), none to be eligible for more than four years in any period of eight years; (11) that the General Assembly shall provide by law for a system of taxation, the purpose being to give plenary taxing power to the Assembly, and to enable it to classify property for taxation, and to eliminate the requirement of a "uniform general property tax"; (12) that senators and representatives shall be apportioned every six years among the several counties according to the votes cast at the last preceding election; (13) that aliens shall be fully naturalized before voting (hitherto aliens could vote in Indiana after taking out their first papers, if they had been in Indiana six months and in the United States one year).

All the amendments were rejected, although the last-named received a majority of the votes cast.

Indiana furnished 121,000 men to the U.S. army during the World War and 5,516 men for the U.S. navy. In proportion to population, the state furnished more volunteers (25,148) than any other. The number that died was 3,354 men and 15 nurses. A "Gold Star" volume in commemoration of these men and women has been published by the state. A total of 317 men from Indiana received citations for extraordinary bravery performed while in line of duty. The people of the state bought a total of $451,000,000 worth of Government bonds in the five Liberty Loan drives in Indiana; the sale of war savings stamps and thrift stamps totalled $47,000,000, making a grand total of $498,000,000. This means that Indiana bought for every man, woman and child in the state an average of $166 worth of bonds; or for every family of five an average of $1,000 worth of bonds. Indiana was well organized for war. There was a state Council of Defence, and, in every county, a county Council of Defence. Food production was encouraged. Over 500,000 war gardens were planted. The corn acreage of the state was increased by 600,000 ac. over 1916, and 524,000 more acres of wheat were sown in 1917 than the year before. The production of hogs and of all food products was greatly increased, in coöperation with the U.S. Food Administration. The food production in Indiana increased by 25% during the war-time years 1917 and 1918.

Since 1909 the governors of the state have been as follows: Thomas R. Marshall (Dem.), 1909–13; Samuel Moffet Ralston (Dem.), 1913–7; James Putnam Goodrich (Rep.), 1917–21; Warren T. McCray (Rep.), 1921–

**INDIANS, NORTH AMERICAN** (*see* 14.452*).—In the region N. of Mexico, to which this article is confined, the Indians are no longer warlike nor do they resist to any extent efforts for their civilization. The United States Government assumes that health, education and industry are essential to the Indian's self-support and citizenship. The settled policy is, therefore, to hasten his advancement in these particulars and meanwhile to protect his personal and property rights. Under the administration of the Bureau of Indian Affairs there are provided health supervisors, school and agency physicians, field matrons, nurses, travelling dentists and hospitals for all forms of disease, but with special reference to the care of infants and expectant mothers, and the treatment of tuberculosis and trachoma. For education, the Government conducts 184 day schools, 61 reservation and 29 non-reservation boarding schools with an attendance of over 25,000 pupils, and provides courses of study combining academic and industrial training adapted to Indian needs and temperament. The aim is to prepare girls to become good housewives and mothers in their home communities and to fit boys for practical farming, or to give them such elementary knowledge and practice in mechanics as will lead to skilled workmanship. At seven of the larger schools vocational training extends through the tenth grade and at one of them is a thorough commercial course. In 1920 these advanced schools enrolled 5,300 students; their graduates readily found remunerative employment in agriculture, the trades and business pursuits. In all Federal schools prominence is given to hygiene, to moral conduct, to religious culture and to the practice of thrift. State public schools in 1920 were accessible to and enrolled more than 30,000 Indian children. Over 5,000 are cared for in mission and private schools.

To promote reservation industries there were maintained, in 1920, eight demonstration and four experimentation farms, and several hundred farmers, stockmen and assistants living near Indian communities were employed for purposes of oversight and instruction in modern methods of agriculture and the breeding and handling of live stock. Loans were made to energetic Indians from tribal or Government funds as initial capital for beginning their self-support. Special attention was given to the reclamation of arid and semi-arid Indian lands, resulting in the irrigation of about 350,000 ac., with nearly a million more under project. The annual increase in crop values was nearly equal to the cost of the investment. Tribal herds of sheep and cattle were maintained on a number of reservations with financial profit, but chiefly to encourage individual ownership and enterprise in live stock. The affairs of the Alaskan Indians were supervised by the U.S. Bureau of Education. Sixty-seven schools were conducted, with a field force of 6 superintendents, 9 physicians, 13 nurses and 133 teachers. Five hospitals were maintained and native girls were taught nursing. The work was carried on in 67 villages scattered along the coast and on the great rivers. Imperfect transportation and adverse climatic conditions rendered the service very difficult, but progress was substantial.

In Canada the Department of Indian Affairs has administrative charge of all Indians and Eskimos. There were in 1911 103,661 Indians and 4,600 Eskimos in Canada, a total of 108,261; in 1919 105,998 Indians and 3,296 Eskimos, a total of 109,294. The Spanish influenza affected the increase for 1920, and the approximate figures for that year were 105,800 Indians and 3,200 Eskimos, a total of 109,000. The Indians and Eskimos are located on reserves in different parts of the Dominion, and the Department of Indian Affairs directs through its 114 agencies the activities for their education and health, and the development of agriculture and other pursuits among them. The less civilized groups are stationary in population, but the more progressive show an appreciable gain in number and physical standards. The educational work comprises 247 day, 58 boarding and 16 industrial schools. The staff of an agency, which may control from one to 30 bands, usually includes, besides the agent, a medical officer, clerk, farm instructor, field matron, stockman, constable, etc., whose work is supervised by inspectors. The Indian population is chiefly W. of Lake Superior. In the vast region E. of the Rocky Mountains, where the aboriginal title was extinguished, the Government promised gifts in cash and lands and aid in education and agriculture. Food was supplied for a time, following the disappearance of the buffalo, but is now practically discontinued, and farming, stock-raising and, in the more remote districts, hunting and fishing furnish means of livelihood. In British Columbia no cession of the Indian title was sought or obtained, but adequate reserves have been set apart, many of which are suitable for stock-raising and to some extent farming and horticulture, and the same assistance in education and agriculture is given as in the other provinces. In the older regions of the provinces of Ontario and Quebec the Indians are entering more and more into the life of the country as farmers, artisans, teachers and lumbermen, with some few as surveyors and physicians, and are increasingly becoming citizens. Enfranchisement, however, which establishes full citizenship, is extended with great discretion, since, if prematurely conferred, the Indians concerned cannot hold their own with white men.

Under the policies outlined the N. American Indians in the United States and the Dominion made unusual progress during the decade 1910–20. Their population at its close was greater than at any time in the preceding half-century. They depend less upon "medicine men" and more upon medical science and sanitation. As compared with earlier periods, they are giving more attention to permanent homes; are less nomadic and superstitious. Their women are better house-keepers, and infant mortality is decreasing. The day of paint and feathers and blanket garb is passing. Nearly two-thirds of their number wear citizens' clothing. The younger, school-trained element is creating a new leadership manifested in changing habits, customs, industrial pursuits and social life. Marriage by tribal custom is giving way to legal rites, and crime is diminishing. In the United States approximately three-fourths of the Indian children of suitable age and health are enrolled in some school, Federal, state or mission. There has been a steady increase in the number of Indians who speak, as well as of those who read and write, English, and a friendly Indian sentiment towards the schools generally prevails. Substantial advancement is noticeable in agricultural operations and stock-raising, the use of modern machinery and methods, in the large additions to individual funds, and the increasing citizenship through the acquirement of fee title to lands, as well as in the lively interest the Indians now show in exhibits of their industrial products at fairs, where they compete with one another and with the whites.

The acceptance by the Indians of the principles of government and civilization was proved by their conduct in the World War. In the United States the number of Indians in military service was more than 10,000, three-fourths of whom enlisted. In Canada the number exceeded 4,000, all volunteers, as they were exempted from the operation of the Military Service Act. The percentage of Indians of military age in the war was probably equal to that of the whites and their proportion of volunteers even greater. They were mingled almost entirely with white organizations and were highly commended by their officers for their intelligence, courage, discipline and efficiency. The Indians ineligible for war duty were equally patriotic. They were active in Red Cross and other relief work, and responded to emergency demands for all productive labour. In the United States they subscribed $25,000,000 for Liberty Bonds, and purchased upwards of $2,000,000 in War Savings Stamps.

**INDO-CHINA, FRENCH** (*see* 14.490).—The French Indo-Chinese Union comprises the following areas:—

| | | |
|---|---|---|
| Cochin-China, pop. (1921) 3,795,613 | | capital Saigon (83,000 inhabitants) |
| Tongking | " 6,100,000 | capital Hanoi (120,000) |
| Annam | " 4,800,000 | " Hué |
| Cambodia | " 1,500,000 | " Pnom-Penh |
| Laos | " 500,000 | " Luang-Prabang |

Kwangchow Wan Territory, 150,000 inhabitants.

There were in 1914 1,273 m. of railway open and 154 m. under construction, less than half of the minimum required to satisfy the essential needs of the colony. The deficiency was made up by regular services in every part of the country having navigable waterways. In 1918 there entered Indo-Chinese ports 2,219 vessels, with a tonnage of 2,376,347; there left 2,087 vessels, with a tonnage of 2,222,935,—a total of 4,600,000 tons.

The wealth of Indo-China springs chiefly from rice. The crop is annual in Cambodia, Cochin-China, and the southern part of Annam, and bi-annual in Tongking and the northern part of Annam. The rice-fields covered about 4,700,000 hectares in 1920, in which year the crop amounted to 4,500,000 tons. Indo-China is, after Burma, the second rice-exporting country of the world; in 1918 she exported 1,600,000 tons and in 1919 966,865 tons, valued at 367,678,000 francs. Export is chiefly to China, Japan, and the Philippines, but shipments to Europe, and especially France, were increasing. The sugar-cane is found in almost all parts of Indo-China, especially in Annam, and production showed considerable development. The exportation of sugar has doubled since 1913, and amounted to 7,718 tons, of a value of 9,202,000 fr., in 1919. The coconut-palm is common everywhere save in Tongking. Cotton flourishes in Cambodia, and plantations in other parts of the country are satisfactory. The forests, not yet fully explored, are immense, covering the major part of the mountainous regions, and including a singularly large number of species of trees.

Indo-China is rich in coal, which makes it exceptional among French colonies. The principal deposits are in Tongking, in the immediate neighbourhood of the Bay of Along (region of Honghai). The total production, including lignite, which is found in numerous beds, was in 1918 636,000 tons.

There is much iron, mainly haematite, but it is not exploited. On the other hand, the zinc of Tongking is being more and more developed (production: 33,438 tons in 1913). The most important industries of the country are those derived from rice—rice-mills, and distilleries preparing a spirit largely consumed by the Annamites.

The general commerce of Indo-China attained in 1919 the figure of 1,841,966,000 fr., of which 791,073,000 fr. were imports and 1,050,893,000 were exports. France, by reason of difficulties in marine transport, stood for little in these exports, the greater part of which went to Hong-Kong and Singapore, and some to China and Great Britain. The figures for general commerce in 1918 were only 817,687,000 fr. total, of which 363,383,000 fr. were imports and 454,304,000 exports; but the fluctuations in the value of money must be allowed for. In any case, the figures for 1918 represented an increase of 14,132,000 fr. over the previous year, and a surplus of 148,132,000 over the average for the five years 1913–7. In 1913, the last normal year before the war, the general commerce amounted to 650,591,000 francs. (M. R.*)

**INDUSTRIAL COUNCILS** (UNITED KINGDOM).—The formation of joint industrial councils (or, as they are commonly called, "Whitley Councils") has been one of the most important sequels of wartime developments in the attempt to adjust the relations of employers and employees in the organization of British industry. These joint industrial councils are bodies representing, usually in equal numbers, the organized employers and employees in the particular industries concerned; and they are the outcome of the recommendation made for this purpose by a committee (which became a sub-committee of the Reconstruction Committee) appointed in 1916 by Mr. Asquith, as Prime Minister, and presided over by Mr. J. H. Whitley, M.P. (then Chairman of Committees in the House of Commons), the reference being:—

1. To make and consider suggestions for securing a permanent improvement in the relations between employers and workmen;
2. To recommend means for securing that industrial conditions affecting the relations between employers and workmen shall be systematically reviewed by those concerned, with a view to improving conditions in the future.

The Whitley Committee was composed of well-known representatives of trade unions and employers' associations experienced in collective negotiations, with certain public men and women not directly associated with the interests of employers or employed. One of the most important developments in the improvement of industrial relations before the World War had been the establishment of voluntary conciliation boards or machinery for the settlement of labour disputes, and, in the course of a considerable number of years, such bodies or machinery had been established in most of the well-organized trades in the United Kingdom. Along with the great body of collective regulations established over a long period of years, this machinery was practically for the time being set aside by war conditions, which at the same time produced a remarkable growth in trade-union organization, and necessitated much consultation between the Government and representative bodies of employers and trade-unionists, who were also often associated in official boards of control, such as the Cotton Control Board.

When the Whitley Committee was appointed it was widely recognized that a permanent solution of the "Capital and Labour" question was one of the most important of the social and industrial problems of the post-war reconstruction, with a view to which first the Reconstruction Committee and later the Ministry of Reconstruction were formed. The origins of a few of the councils may be carried back, however, to a time before the appointment of the Whitley Committee, or even, in idea at least,

to before the outbreak of war; and these origins are to be found in the desire of certain groups of individuals, with knowledge or experience of industrial disputes, to create some new form of joint organization which would unite the employers and employees in an industry in coöperation for common ends. Thus, the conception of a building-trades parliament may be traced back to 1914. Again, a national painters' and decorators' joint council was formed in the winter of 1916–7, before the publication of the first Whitley report. Before also the Whitley Committee reported, the activities initiated by certain private individuals interested in industrial matters, leading up to the formation of the Pottery Joint Industrial Council (the first of the officially recognized Whitley Councils), had been in progress for some time.

Here it may be noted that the name "Industrial Council" has been applied to other bodies which must not be confused with the joint industrial councils set up through the Whitley report, though they have certain connexions with these councils. Further reference to these bodies is made at the end of this article.

The Whitley Committee presented an interim report on joint standing industrial councils in March 1917 (Cd. 8606). In this report they recommended that, so far as the main industries of the country, in which there existed representative organizations of employers and employees, were concerned, the best way to deal with the first point in the terms of reference was to settle the second point, and for this latter they proposed the institution of joint standing industrial councils. The proposed councils were to be joint, so as to bring employers and workpeople together; standing, to ensure the regular discussion of matters of common interest; and industrial—that is, formed on an "industrial" rather than a trade or craft basis. In order to secure the realization of what may be considered the fundamental idea of "continuous coöperation in the promotion of industry" the committee recommended that, in addition to national joint industrial councils covering complete national industries, there should be formed also district councils and works committees. It was contemplated that the machinery should be decentralized, the district councils dealing with district matters within the limits laid down by a national council for the industry, and the works committees dealing in the same way with questions peculiar to the individual workshop or not of general concern. A fundamental condition affecting the formation of the councils was that the members should be chosen exclusively from the trade unions of the workpeople and the associations of the employers; this first report had reference only to well-organized industry, and the scheme outlined was not considered applicable where organization was weak or non-existent. Following its circulation to all the principal trade unions and employers' associations, the report was adopted by the Government in Oct. 1917 as part of its industrial policy. At the same time the Government decided to recognize the industrial councils as standing consultative committees for their industries.

The Minister of Labour was charged with the duty of providing the industries with assistance in the formation of councils, and the first joint industrial council to be officially recognized was that formed in the pottery industry in Jan. 1918. The following list includes all the councils which had been officially recognized up to the end of Jan. 1921, at which time, however, 11 of the councils listed had more or less definitely broken down (these being marked by an asterisk). The operations of several others were intermittent, a principal reason for the failures being lack of adequate organization.

Asbestos manufacture
*Bread-baking (England and Wales)

In the formation of nearly all these 65 councils a main part was taken by the Ministry of Labour, which arranged conferences and carried through the often difficult and prolonged work of negotiation between the various associations of employers or workpeople concerned. Of the 65, 20 were formed in 1918. 30 in 1919, and the remainder during the next 13 months.

On Oct. 18 1918 the Whitley Committee presented a second report on joint industrial councils (Cd. 9002). This recommended, for trades where organization was very weak or non-existent, an adaptation and expansion of the system of trade boards, working under an amended Trade Boards Act, and, in trades in which organization was considerable but not yet general, a system of joint councils with some Government assistance which might be dispensed with as the industries advanced to the stage of organization contemplated in the first report for joint standing industrial councils. The second, unlike the first report, was not completely adopted by the Government. In June 1918 a joint memorandum on the proposals contained in the second report was issued by the Minister of Labour and the Minister of Reconstruction. This memorandum emphasized the desirability of separating as completely as possible the trade board and the joint industrial council forms of organization, so as to develop the voluntary bodies only where the degree of organization warranted them, and the trade boards only where lack of organization made the statutory regulation of wages necessary.

In the meantime, for the purpose of consultation on questions of industrial reconstruction, it had been agreed by the Minister of Reconstruction, the Minister of Labour and the President of

the Board of Trade that representative joint bodies should be formed on a less restricted basis than was contemplated in the first Whitley report. These interim industrial reconstruction committees, as the joint bodies were called, were begun to be established by the Ministry of Reconstruction in the beginning of 1918. They differed from joint industrial councils in that they were not intended to be permanent, and in that they were often formed in industries which had insufficient organization for joint industrial councils. They resembled joint industrial councils in being purely voluntary bodies and in the fact that their members were representatives of organizations of employers and workpeople. The formation of these interim committees did not violate the agreement as to policy contained in the joint memorandum referred to above, since the committees were formed primarily for special and temporary purposes, and were not meant to be permanent. It was contemplated that in some industries joint industrial councils would develop out of the interim committees as organization improved and, where organization remained weak, the existence of such a committee or any other voluntary body could not prejudice the power of the Minister of Labour to establish a trade board. A considerable number of such interim committees were formed. Several of these became joint industrial councils, some continued to operate as interim committees, while others had by 1921 ceased to exist, and in a number of the industries affected trade boards have since been formed.

The joint industrial councils have, for the most part, been formed on fairly uniform lines. A council is usually formed of equal numbers of members from the employers' associations and from the trade unions connected with the industry. The normal rule as to the appointment of officers is that there should be a chairman and vice-chairman and two secretaries: if the chairman is a member of the employers' side the vice-chairman is chosen from the trade-union side and *vice versa*, and a change in the side from which the chairman is chosen is made each second year. The secretaries are chosen usually one from each side. The two-sided character of the council is reflected in the rule commonly adopted in regard to voting: that no resolution shall be regarded as carried unless approved by a majority of the members present on either side. Usually in practice this means that decisions have to be arrived at by agreement. The councils generally have adopted not only uniform procedure but also a somewhat uniform statement of functions. The general object of a joint industrial council is often drafted in terms which indicate that it exists, to quote the final report of the Whitley Committee (Cd. 9153), to deal with all "matters affecting the welfare of the industry in which employers and employed are concerned," and to care for "the progressive improvement of the industry as an integral part of the national prosperity." In addition to such general statement of its functions, the constitution of a council usually includes, as more specific objects, the consideration of questions falling under such heads as the following: (*a*) wages, hours, working conditions, regulation of employment, machinery for settlement of differences; (*b*) improvement of health conditions in the industry, supervision of entry into and training for the industry; (*c*) extension of organization in the industry; (*d*) collection of statistics and information, encouragement of research and of invention, inquiry into special problems of the industry and publication of reports; (*e*) the formation of district councils and works committees; (*f*) the representation of the opinions of the industry to the Government and (*g*) coöperation with other councils in matters of common interest. In idea, therefore, the joint industrial councils are differentiated from the pre-war conciliation boards, which were usually confined, by their constitutions, to questions of wage bargaining and the like. The number of members on a council varies from as much as 130 in the building trades council (which is exceptional also in several other respects) to 13 on the wall-paper manufacture council. Other councils range between this latter figure and 70 in the printing trades council, about 30 being a common membership. A few councils are differentiated from the others in that they do not concern themselves with negotiations on wages or hours of work or with the settlement of disputes; the sub-title (building trades parliament) of the council of the building industry is meant to indicate the *deliberative*, as contrasted with the negotiatory, purposes for which this council was established. The conception of such trades parliament for the industry goes back to 1914.

The most important of the great national industries, which have attained the highest degree of organization,—*e.g.* coal-mining, iron and steel manufacture, cotton manufacture, engineering and iron founding,—had not adopted the Whitley scheme up to the early part of 1921. The industries in which councils have been formed vary from such national industries as those of building, printing, and wool manufacture to such small and localized industries as the manufacture of bedsteads, locks and latches, needles and fish-hooks. A large proportion of the industries are local in character, and it may be doubted whether some are more than sections of the industrial units for each of which the Whitley Committee meant a national industrial council to be formed. (The Whitley report did not, however, clearly define what it meant by an "industry.") Again, the trade or craft rather than the industrial basis has been adopted in one or two instances. The coopering joint industrial council is an example of this, the organization on both sides following craft lines and being on one side that of the skilled coopers and on the other side that of the employers of such coopers, whether or not master-coopers. The failure to form councils representative of industries rather than trades or crafts would appear to go further than this in so far that the interests represented on several of the councils are only the employers and the trade unions representing considerable sections of more or less homogeneous labour, but not all the occupations in the industry. This failure to realize the completely representative character of an industry is of interest from more than one point of view. It relates the councils to the well-established forms of pre-war conciliation machinery which have developed generally on a craft or occupational basis. It is important also from the point of view of those wider functions of a character other than wage bargaining which the councils have been expected to undertake. For this purpose it would appear to be necessary to have a body more completely representative than a joint industrial council usually is of all the interests in an industry. The constitution of a joint industrial council commonly allows for the coöptation of expert members, and the building council has recently in this way made an addition of representatives of the associations of architects and architects' assistants. This, however, is as yet unusual. Though various associations of managerial workers and technical experts have shown a desire to be represented on the councils there has been practically no development in this direction by either direct representation or coöptation.

The Whitley scheme has been extended to services which are not ordinarily included under the term "industry." A joint industrial council has been formed for the local authorities (administrative, technical and clerical staffs), covering on the employees' side various grades of workers up to and including the higher officials, such as town clerks. For the civil service there is an elaborate scheme embracing all grades of civil servants in the administrative and legal departments. Various attempts, most of them unsuccessful up to the present, have been made by organizations of bank officers, insurance clerks, and other "black-coated" workers, to obtain the formation of councils for their professions. This extension of Whitley council machinery to services and professions outside the industrial sphere is a natural accompaniment of the growth of organization among non-manual workers, other results of which are to be seen in the establishment of various other forms of conciliation.

The formation of district councils as subsidiary bodies to national councils appears to have been effectively carried out on the lines proposed in the Whitley report only in a very few industries; a considerable number of the effective district councils are connected with the national councils which deal with services under the control of local authorities. The Whitley report further recommended works committees as part of the machinery, and the establishment of such committees as well as district councils has been systematically encouraged and assisted by the Ministry of Labour as part of the development of the Whitley scheme. Works committees were the subject of a separate report of the Committee on Relations between Employers and Employed (Cd. 9085), and at the request of that committee the Ministry of Labour made an inquiry into existing works committees in the winter of 1917-8 (Ministry of Labour Industrial Report No. 2). The number of works committees in existence throughout the country is small in relation to the number of industrial establishments of suitable size. Several of the joint industrial councils—*e.g.* those for the pottery and the iron and steel wire industries—have taken active steps to have such committees established in the works which were considered suitable, but little progress appears to have been made in some of the other industries which possess Whitley councils.

By far the largest bulk of the work done by the joint industrial councils has taken the form of the settlement of the rates of wages, hours of work, and similar questions. Agreements on such questions, some of them national agreements, have been arranged on the majority of the councils, and the formation of the councils has meant the introduction for the first time into some of the industries of systematic methods of collective bargaining.

Some councils have made reports on education as affecting their industries, and others have dealt with such questions as conditions of safety in the works. The pottery council has conducted an inquiry into average earnings, costs and profits upon turnover. A report of the majority of a sub-committee of the building council, not adopted by the council, contained proposals for a radical alteration in the economic basis of the industry.

*Other Bodies.*—The name "Industrial Council" has been applied in two important instances to bodies other than Whitley councils. In Oct. 1911, following upon the transport and other strikes of that year, an addition was made by the Government to

the official machinery applicable by the Board of Trade to the working of the Conciliation Act of 1896. This took the form of an Industrial Council which consisted of 13 representatives of employers and the same number of representatives of workers, invited by the President of the Board of Trade to serve on the council with, as chairman, Sir George (afterwards Lord) Askwith who, at the same time, was appointed Chief Industrial Commissioner. This Industrial Council of 1911 was formed as a permanent body for inquiring into trade disputes and for taking action, without compulsory powers, by way of conciliation; that is, it was to be a national conciliation board. In this capacity the council came to very little, and subsequent action has proceeded along different lines. The council's principal achievement was an inquiry into the subject of industrial agreements made at the request of the Government, the report on which was issued in 1913 (Cd. 6952). This contained a recommendation that, in certain conditions, the operation of a collective industrial agreement should be capable of extension by law so as to apply compulsorily not only to the signatories but also to a minority in the industry which had not been a party to the agreement. This recommendation, to which considerable objection has been taken, anticipated one of a similar nature contained in paragraph 21 of the first Whitley report.

The second important instance of the use of the name "Industrial Council," otherwise than in connexion with Whitley councils, is more recent. As a result of a great industrial conference convened by the Government in Feb. 1919 a report (Cmd. 501, 1920), dealing with a variety of industrial problems, was prepared. This included a proposal for the formation of a National Industrial Council, or what may be described as an advisory "Parliament" of industry. The proposals as to the membership and objects of the council followed the lines adopted in the Whitley councils; but the National Industrial Council, consisting of 400 members fully representative of and duly accredited by the employers' associations and the trade unions, was to speak for industry as a whole and on matters of general interest to all industry. It was pointed out that the council was to supplement and not to supersede any of the existing machinery; the general definition of its objects reads: "to secure the largest possible measure of joint action between the representative organizations of employers and workpeople and to be the normal channel through which the opinions and experience of industry will be sought by the Government on all questions affecting industry as a whole." At the beginning of Jan. 1922 the council had not yet been formed.

**INDUSTRIAL MANAGEMENT:** *see* SCIENTIFIC MANAGEMENT.

**INDUSTRIAL MEDICINE.**—The subject of health in relation to work is a wider one than is covered by present-day legislation, wider probably than ever can be covered by statute and regulation. The State is interested in the prevention and treatment of disease; but industry is directly concerned with the preservation of health, whereby contentment may be attained and unrest abolished, whereby greater productivity may result as regards both quality and quantity of output and increased earning power, whereby less waste may occur from labour turnover or from lost time due to sickness and injury. In fact, industry as represented by both capital and labour requires a maximum of human efficiency and activity, and a minimum of over-fatigue and ill-health.

Appreciation of the position as regards industrial health was forced to the front during the World War owing to labour scarcity, and since then by the high cost of labour. While in Great Britain the welfare movement (*see* WELFARE WORK) has been developing to deal with one side of the problem, in the U.S.A. the tendency has rather been towards the more purely medical side, and there have come into existence factory medical officers entrusted with examining all candidates for work, re-examining periodically those employed, organizing First Aid for sickness and accidents, and establishing home visitation of the sick. An industrial medical service is thus coming into existence which is still working out its own salvation, neither aided nor impeded by any central authority. Later this American health service will have many lessons to teach. Although industrial medical service is slower in growth in Great Britain, the need has been recognized there for knowledge as to the conditions which make for maximum health and activity—knowledge which must form the foundation of any future industrial health service. Industry has in the past owed much to British physiologists, such as Dr. J. S. Haldane for knowledge upon respiration and the effect of warm humid atmospheres, and Dr. Leonard Hill with relation to the science of ventilation. During the World War, in England, the Health of Munition Workers' Committee set on foot pioneer work which was supplemented by investigation initiated by the Home Office into the subject of industrial fatigue. On completion of the war the work so started was entrusted to a special body, the Industrial Fatigue Research Board, with the following terms of reference:—"to consider and investigate the relation of hours of labour and of other conditions of employment, including methods of work, to the production of fatigue, having regard both to industrial efficiency and to the preservation of health among the workers." This board is now part of the organization of the Medical Research Council.

Certain information has been acquired through these various sources, which may be briefly summarized as follows:—(i.) A maximum of health is needed for a maximum of efficiency. (ii.) Evidence points to maximum efficiency being attained when output of the individual increases steadily but gradually hour by hour during the day, and day by day throughout the week, rather than when maximum output occurs early in the day or in the week. (iii.) Temperature exerts an important influence upon activity; the optimum for heavy physical work is at two or three degrees above or below a mean of 55° F., and the optimum for light sedentary work similarly varies about a mean of 65° F., but in no case should an even monotonous temperature be maintained. (iv.) Ventilation is possibly more important than temperature, not, under normal circumstances, for providing fresh air to breathe, but to stimulate the skin by varied currents of air and to save expenditure of energy by preventing visible perspiration. (v.) The expenditure of physical energy requires, in order to maintain maximum efficiency and avoid over-fatigue, the interpolation of rest pauses which, in proportion to the amount of energy expended, need to be of longer or shorter duration and in the case of heavy physical labour may need to be of longer duration than the period of activity. (vi.) Food suitable in quantity and in quality is required to supply the worker with energy; it must also contain a sufficient amount of vitamines which must be increased in quantity, simultaneously with the supply of food, for workers doing heavy work. Provision should be made for supplying food on factory premises, and care should be taken that the menu is varied. (vii.) Monotony should be avoided, not necessarily monotony such as is associated with repetition processes, but monotony in temperature, in ventilation, in long spells without rest pauses, and in food supply. (viii.) Considerable increase in output (and by hypothesis in health) may result from shortening hours of labour, especially if

rest pauses had not already been scientifically introduced in order to prevent fatigue; but this result cannot be expected to follow where the machine sets the pace and the human element is at a minimum. (ix.) Good lighting, whether artificial or natural (but artificial cannot be as good as natural and is always expensive) improves health and output. Window-cleaning and attention to gas mantles and electric light bulbs are economic propositions. (x.) Change of occupation, apart from all these matters concerning environmental conditions and hours of labour, has a serious effect upon health; during the first weeks and months at new work while for lack of experience output is low in quantity and quality, the incidence of industrial accidents and sickness is unusually high. (xi.) Research has revealed that workers tend to drift from one place of employment to another to an extraordinary extent, and that a labour turnover of 100% per year is rather below the average. This drift, which has been estimated to cost industry £80,000,000 a year, can be largely reduced by personal supervision of workers. (xii.) Working clothes suited to each process are important, in order to permit adaptability of the body temperature and avoid perspiration. (xiii.) A clean skin is of special value to workers to enable them to react to ventilation and avoid septic wounds.

Much more remains to be found out from industry about human efficiency and human health. Already sufficient has been done to demonstrate the existence of a new science aimed primarily at preserving health, and incidentally at greatly increasing industrial capacity. The keystone to the position is that the influence of occupation upon a community cannot be appreciated unless from the first its value for establishing and maintaining health is accepted. Work represents the katabolic side of metabolism and is as necessary to life as is rest, the anabolic side. The study of human activity and its maintenance is the study of health. An important Anglo-American publication, *The Journal of Industrial Hygiene*, is devoted to the subject.

*Medical Service.*—Knowledge is useless unless it receives practical application, and the employment of doctors by industrial establishments is the means to this end. The work to be done varies with the number of employees, but a personnel of 2,500 at an engineering factory provide ample work for a whole-time medical officer if he is entrusted with such duties as examining each applicant for work; caring for the health of those employed by periodical re-examination as required; supervising ambulance and first-aid work; visiting absentees whether injured or sick; controlling the hygienic conditions of workshops, canteens, sanitary conveniences, lavatories and washing accommodation; advising as to faulty posture at work, accident prevention, suitable working clothes, and as to how to fit the worker to the work; keeping personal records of health; and, most important of all, conducting investigations into these records. For smaller establishments a plan has been promoted by a number combining to employ a medical man, remunerating him on a capitation basis of those employed. The expense involved in a factory medical service has always been found to be a good investment, since the loss incurred from labour turnover, from lost time, from accident compensation, and from many other causes, is diminished to an extent which is far in excess of the outlay.

*Industrial Diseases.*—Description of every form of disease which may be influenced by occupation would be description of every ill to which the flesh is heir. A résumé, nevertheless, may indicate how study of the incidence of morbidity and mortality in different occupations throws light on some of the difficult problems connected with the aetiology of disease. The multifarious forms of occupation, particularly those of manual workers, provide opportunities for studying the effect of different influences upon the human organism. Even if data did not exist to prove the point, reason would lead one to expect great variety in the morbidity and mortality experienced by agricultural labourers, coal-miners, textile operatives, boot-makers, chemical workers, shop-keepers, boiler-makers, stone-masons, fishermen, clerks, furnacemen, engineers and many others. Careful inspection of existing data reveals not only that marked differences do exist, but that they are differences in kind as well as differences in bulk—that is to say a high occupational mortality may be, and indeed usually is, due to an excessive death-rate from one or a few causes, rather than to a high death-rate from all causes. Thus chimney-sweeps suffer excessively from cancer, stone-masons from diseases of the lungs, coal-miners from accidents, and printers from phthisis, without necessarily experiencing any increased mortality from all other disease. Further inspection discloses not only an increased incidence of diseases such as are experienced by the general community, but also the occurrence of certain diseases peculiar to certain industries, what are known as diseases of occupation, for example, poisoning from lead, mercury or phosphorus, tubercular silicosis and miners' nystagmus. This latter group has, like all other things which are strange and unusual, drawn more attention than has the influence of occupation in increasing the prevalence of more common forms of disease. Nevertheless the influence of occupation upon the common forms of disease is far more important. Instances are chosen in what follows to illustrate the importance of industrial medicine. Each disease mentioned hereafter is only referred to as an illustration of how obscure problems may be illuminated and how principles underlying the causation and prevention of disease may be disclosed by study of occupational morbidity and mortality.

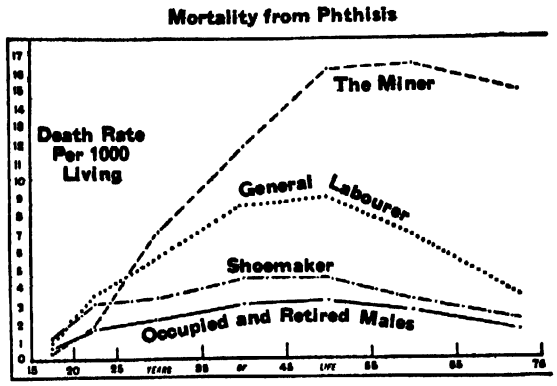
*Accidents.*—Objection may possibly be raised to including accidents among diseases, but careful inquiry into the incidence of industrial accidents has revealed that we succumb to accidents much as we succumb to those forms of ill-health commonly attributed to infection. In other words the incidence of accidents obeys epidemiological laws. Accidents are found to occur with greater frequency with advancing years, just as does cancer. The risk of accidents is greater in some industries, such as mining, than in others; just as tuberculosis is more prevalent in slums. Accidents due to different causes, say falls of roof in coal-mines, cause similar death-rates from year to year, and a similar proportion of total accidents; just as pneumonia year by year causes similar death-rates, and forms a similar proportion of total deaths. Accidents to different parts of the body, say to the eye, form year by year the same proportion of accidents to all parts; just as tuberculosis of the peritoneum forms the same proportion of tuberculosis of all regions. Accident-occurrence is affected by hygienic conditions—fatigue, psychical influences, ventilation, lighting, and temperature—in the same way as are general illness and disease. Accidents in any community are distributed not according to pure chance, but according to varying individual susceptibility; just as certain diseases run in families, due to "inherited predisposition." Workers newly exposed to risk sustain a high proportion of accidents, which diminishes with length of employment; just as lead poisoning claims most of its victims among new workers, or as South African natives succumb to pneumonia when first introduced to civilized communities.

Study of industrial accidents on the above lines indicates that the origin of the vast majority lies in the physiological and psychological state of the worker and his reaction to his environment; that the origin of other forms of morbidity and mortality is in the long run similar, and that the most promising way of attacking the incidence of accidents and of disease is through interesting the community individually in the need for maintaining personal health and resisting power, rather than by encouraging implicit reliance upon protective guards, whether they take the form of fencing machinery to prevent accidents, or using so-called disinfectants to prevent infection.

Action directed to this end is known as the Safety First movement with which the general community is acquainted. In the industrial world steps are being taken to interest the workers by forming in factories accident committees representative of all classes employed. Each accident as it occurs is investigated and reported upon by the committee, and in this way the members, who only serve for short periods of about six months, become acquainted with the principles of accident prevention. The prevalence of accidents where such committees exist has been reduced to an extent as satisfactory as it is surprising. The lesson to be learnt from a study of industrial accidents is that the general health of the community depends upon each individual understanding that his own health is largely in his own hands and that he owes to himself and to the community the duty of maintaining it.

*Phthisis.*—The occurrence of disease in general may be held to depend on a chain of three links. The first represents a latent capacity to be affected—what is known as hereditary predisposition—which is present in varying degrees in different individuals; so long as this capacity is latent exposure to risk has no effect. The second represents activation of this capacity or sensitization of the individual; exposure to risk now is followed by disease. The third represents risk; which in the case of phthisis is exposure to infection by the tubercle bacillus. Occupations tend to select individuals according to their latent capacity, inasmuch as industries calling for strenuous exertion, such as mining, metal-smelting, and agriculture, call for those physically fit, while indoor and sedentary occupations, such as tailoring and printing, tend to be followed by more weakly individuals. There is, however, no evidence that these weakly individuals are especially weakly so far as phthisis is concerned, and they might be expected to suffer in equal excess from all causes of death. But the incidence of phthisis suggests that certain occupations sensitize workers to the normal risk from infection, while others increase the risk; and study of the occurrence of phthisis in industry is found to support the general view of disease here stated, although difficulty may occur in any particular industry in determining whether the second or third link is the more important.

Study of the distribution of phthisis according to sex and occupation is of great interest in this connexion. Distribution according to sex is important because males as a class are employed away from their houses so much more than females that they may be held to represent the influence of occupation. Distribution according to occupation indicates what influences are favourable, what unfavourable. Phthisis is an index disease, that is to say its incidence rises



and falls with the general death-rate for all causes, but more rapidly. Thus, while the mortality from phthisis among males in the past 50 years has fallen 50%, the general mortality has fallen only 25%. Consideration of phthisis for this reason is of especial value. If the mortality from the disease among males during the period 1851–60 be taken at a comparative figure of 100, then that of females was 106 at that date; in 1901–10 the comparative figure for males had fallen to 50, and that of females to 35. These data show that females are as liable to phthisis as are males: indeed up to the age of 15 years they continue to experience a heavier mortality than males; and that whatever influences have contributed to the fall which has taken place, they have clearly not been so powerful in relation to males.

The distribution of phthisis from the age of 15 years and upwards, *i.e.* the period of industrial life, discloses that the disease is more prevalent in urban than in rural districts, and that it attacks males more than females. This increased incidence among males is less marked in rural districts than in urban districts. Since housing conditions are the same for the two sexes, these figures point to the occupation of the male exerting a powerful influence. War-time experience showed that industrial occupation can exert such an influence, for in Great Britain the mortality from phthisis among females rose during 1915, 1916, 1917, and 1918, in proportion to their employment in the munitions industry. It rose most for towns, like Birmingham, Coventry, Manchester, Newcastle, and Sheffield, much affected by war industries; less in towns less affected, like Ipswich, Norwich, Stoke-on-Trent, York, and Worcester; and did not rise or even fall in unaffected towns, like Bournemouth, Brighton, Oxford, and Great Yarmouth. Since the war, women in industry have given place to men, and their mortality from phthisis has fallen again, even below pre-war figures.

When the data for phthisis mortality according to occupation are closely examined, four broad groups can be distinguished. One in which the phthisis mortality is below normal; this group includes agriculture and coal-mining, industries in which opportunity for infection through close personal contact is at a minimum. A second in which the phthisis mortality is above normal, but is the only cause of mortality which is high; this group includes printers, tailors, and boot-makers, who work sufficiently close together to enable infection to pass from person to person (and in rooms where the atmospheric conditions are physiologically adverse). A third in which a high mortality from phthisis is associated with a high mortality from other respiratory diseases; this group includes sandstone-masons, tin-miners, grinders of metal, and others exposed to the inhalation of fine particles of silica. Silica-dust when inhaled appears to possess the power (not yet fully understood) of sensitizing the lung tissue to attacks of tuberculosis. And a fourth in which high mortality from phthisis is associated with a high mortality from all other causes of death; this group includes general labourers and publicans. The publican owes his high general mortality to the power possessed by alcohol of sensitizing the general capacity for succumbing to disease. The general labourer who belongs to the poorest trade of the industrial world is an instance of the claim (mainly supported by evidence other than occupational) that phthisis is a *pestis pauperum*. A possible explanation of this claim is forthcoming from recent investigations into food, which have revealed that the energy contained in food cannot be exploited unless certain food accessory factors (vitamines) are present; vitamines occur most plentifully in expensive forms of food, such as butter, meat and fresh vegetables. These forms of food, especially in the form of animal fats like cod-liver oil, have long been accepted to be of value in relation to phthisis. Further, the supply of vitamines is required to be increased if the output of energy is to be increased. Poverty connotes a low standard of food supply. Industry calls for expenditure of physical energy, which must be obtained from food. The combination of low wages, with a call for expenditure of physical energy, such as is found in the general labouring class, should be, and indeed is, found to be associated with a high mortality rate due to phthisis and to other causes of death as well.

Discovery of a high mortality from phthisis combined, or not combined, with a high mortality from other respiratory diseases alone or from all other causes of death, enables the industry in which it occurs to be placed in its proper group, when the prevalent factor influencing the mortality is indicated. The method of procedure may be seen from the data embodied in the table at foot of page.

Statistical investigation may also provide further evidence. Reference to the age distribution of any phthisis death-rate brings out that the disease is more prevalent at different ages in different groups, as may be seen from the diagram. The median age at death from phthisis for shoe-makers lies between 38 and 39 years of age, which is the same as that for occupied and retired males. And their curve, although at a higher level throughout life, closely resembles that for occupied and retired males. The conclusion follows that if increased infection is the paramount influence determining the influence of phthisis among shoe-makers, it is also the main influence affecting its incidence among occupied and retired males.

The curve for the general labourer is different in shape; it diverges from the standard continuously up to the age of 50, and although the difference remains considerable in later years it does not maintain the position attained in middle life. The median age at death from phthisis for this group lies between 40 and 41 years of age. Here, apparently, the influence which leads to the increased mortality takes some years exerting its full effect. In the case of the tin-miner the median age at death lies between 43 and 44 years of age, and the curve shows in early adult life in an exaggerated form the same tendency to diverge from the standard. Apparently, the adverse influence once established maintains its power throughout life.

Investigation of phthisis in industry indicates that the disease is to be combated in the general community by maintaining a general resistance against disease, especially through a food supply sufficient for energy needs, by preventing infection from individual to individual through avoiding over-crowding, and in special industries by ensuring the absence of harmful silica-dust.

Injury or trauma, of which pulmonary silicosis may be taken as an example, has long been recognized to sensitize to tuberculosis, whether of bones in childhood or of the lungs in adult life. Tuberculosis here resembles miners' nystagmus, pneumonia and delirium tremens, all of which may be precipitated by an accident. But silicosis further provides a reverse influence; for if a patient who appears to be only slightly affected with silicosis becomes infected with tubercle, the silicotic condition may advance rapidly, almost as though it were precipitated by the infection. The similarity between such a precipitation and the formation of tophi in gout is significant.

The only form of phthisis legally recognized to have a definite industrial origin is tubercular silicosis in which the disease is predisposed to by, or super-imposed upon, a condition of pulmonary silicosis caused by inhaling silica-dust.

COMPARATIVE MORTALITY OF CERTAIN CLASSES AGED 15 YEARS AND UPWARDS, 1900–20

| Cause of Death | Standard | Group 1. Low General Mortality | | Group 2. Phthisis alone in Excess | Group 3. Phthisis & Respiratory Diseases in Excess | Group 4. High General Mortality | |
|---|---|---|---|---|---|---|---|
| | (Occupied & Retired Males) | (Agricultural Class) | (Coal-miner) | (Shoe-maker) | (Tin-miner) | (Publican Inn Servant) | (Dock Labourer) |
| Influenza | 100 | 100 | 88 | 67 | 104 | *171* | 79 |
| Alcoholism & Liver Diseases | 100 | 47 | 51 | 77 | 28 | *670* | *167* |
| Cancer | 100 | 74 | 78 | 103 | 101 | 110 | *112* |
| Phthisis | 100 | 45 | 48 | *145* | *436* | *173* | *165* |
| Other Lung Diseases | 100 | 49 | *111* | 84 | *419* | *148* | *206* |
| Nervous Diseases | 100 | 60 | 84 | 101 | 84 | *178* | 109 |
| Circulatory Diseases | 100 | 66 | 92 | 100 | 105 | *144* | *129* |
| Bright's Disease | 100 | 51 | 66 | 86 | *143* | *243* | *117* |
| Accident | 100 | 69 | *208* | 38 | 92 | 88 | *180* |
| Suicide | 100 | 89 | 58 | 100 | 32 | *216* | 63 |

*Dermatitis.*—The occurrence of skin affections in occupations is widespread; they cause much pain and sickness but only rarely mortality. Investigation here has, therefore, perforce to be based on other data than mortality statistics. The conditions associated with any form of dermatitis have to be inquired into until the specific cause is isolated. An instance will indicate the method used which is the same that led to discovery that silica alone among dusts possesses the specific property of predisposing to fibroid phthisis. Women employed in curing herring had long been known to suffer from erythema and painful indolent ulcers on their hands and on their arms, which had been ascribed to many causes, such as the condition of fish. The salt brine, however, with which the herring are cured fell under suspicion; then investigation in another industry in which brine is used for curing sausage-skins disclosed the presence among the workers of similar skin troubles; finally they were also found affecting men employed in brine mines. Clearly the salt brine was the cause. Workers handling potassium bichromate suffer in the same way, and those exposed to inhaling the dust of this compound suffer also from ulceration and perforation of the nasal septum. Next, workers inhaling fine salt dust were found with perforation of the nasal septum; and other substances such as copper arsenite, water glass, arsenious acid, lime, and solutions of acid, were found to cause the same troubles. Search for a characteristic common to all these compounds determined that all substances possessing hygroscopic properties could cause these forms of dermatitis, and that the pathological condition was due to the substance, after gaining access to the cutaneous tissue through some slight abrasion, abstracting fluid and so causing local necrosis. Acting on this theory, in some cases mere dilution of solutions used has abolished the trouble, while in other cases provision of opportunity for thorough soaking the skin after exposure has been equally efficient.

A further instance is also instructive. Certain workers employed in making roll tobacco were found suffering from dermatitis of the hands and forearms. These workers alone among tobacco operatives apply olive oil to the leaf. Other operatives much exposed to the oil were also found to suffer, and investigation established that exposure to the oil was the causative influence. Similar dermatitis also occurs among washerwomen, among workers exposed to alkalis, among mechanics exposed to cooling and lubricating mixtures used in engineering shops, and workmen exposed to turpentine, petroleum and other spirits. Here search for a common characteristic suggested that all substances with a lipoid affinity, *i.e.* capable of dissolving the natural fats, palmitin and stearin, from the skin could cause dermatitis by leaving the cuticle dry and liable to crack when infection from without can take place. Remedies by anointing the skin with lanolin and castor oil in order to replace the fat, and by adding antiseptics to the fluid used in order to guard against infection have proved their value and so support the theory.

Another group of skin affections which includes occupational warts is of considerable interest because of the light it throws upon the origin of epitheliomata. Workers who handle pitch, a distillation product of gas tar, and others who mix pitch with coal-dust in the manufacture of briquettes, suffer from warts which appear on the exposed parts of the skin, and also on the genitals. These warts show a special tendency to become epitheliomatous with the formation of "pitch" cancer. Shale oil workers coming in contact with crude paraffin, a product obtained by distillation, similarly suffer from warts and "paraffin" cancer; but workers manipulating refined paraffin do not suffer. Chimney-sweeps have long been noted for their high death-rate from scrotal cancer which originates from exposure to soot, a distillation product of coal. Cancer of the lips and buccal cavity is nearly confined to males who by smoking expose these parts to the distillation product of tobacco. The evidence here summarized suggests that certain products obtained by distilling vegetable substances can sensitize the skin to cancer.

Evidence from the dye industry suggests that the products in question may possibly be benzene compounds. Workers in this industry exposed to certain amino-benzene compounds, particularly benzidine and naphthylamine (compounds which, when they gain access to the body, are excreted by the kidneys), have been found to develop malignant tumours of the bladder. The new growths which occur on the skin in the tar cases, and in the bladder in the dye-workers, have certain features in common: at first there is a simple hyperplasia; the exact moment when malignancy supervenes is a matter of doubt; and metastasis is the exception. Possibly we have in these benzene compounds instances of substances which, by modifying tissue growth, possess the power of preparing the way for, if not directly causing, malignant changes. Much more research work on the lines here indicated waits to be done, for there are numerous other forms of industrial dermatitis, but the above instances should suffice to show how underlying principles of general utility come to light through investigations conducted in industry.

*Miners' Nystagmus.*—This disease, chosen as an example of a trade neurosis, is one the incidence of which increases with length of employment. It takes on an average 20 years to develop; hence, it lays aside the miner when his skill is at its zenith and he is too old to change his occupation. The complaint is a distressing one which causes much morbidity, but no mortality, and in recent years has increased in prevalence.

The leading symptom is an uncontrollable wheel-like but irregular rotation of the eyeball with the pupil as the hub of the wheel; the sufferer sees the external world constantly moving and rocking before him. At the same time there are marked photophobia, rapid movements of the upper eyelid, and severe headache, which are accompanied by symptoms of general neurasthenia. The condition frequently appears to lie "latent" and to develop suddenly after an injury (especially if to the eyes) or other depressing influence, such as an attack of influenza; this tendency to be precipitated by trauma is even more pronounced than in the case of delirium tremens.

Formerly the disease was mistakenly ascribed to the posture of the coal-getter as he lay on his side holing the coal which necessitated unusual eye movements. Now, thanks to the work of Dr. T. L. Llewellyn, the condition is definitely known to be due to working in dim illumination. It occurs nearly exclusively among coal-getters and hardly at all among the men who convey the coal to the pit shaft or do other work on underground roads. It occurs with equal frequency among men standing at a 6-ft. seam, or kneeling at a 20-in. seam. The frequency of its occurrence varies with the amount of light provided; the less the light, the more the disease; it prevails especially in mines where oil safety lamps, which give a low illuminating power, are used, and is hardly known where naked lights are used, which give twice or three times the illumination.

The two factors which, acting together, sensitize the ocular nerve tracks to the disorganized movements characteristic of the disease, are poor illumination together with need for focussing vision; over 70% of those affected are found to possess errors of refraction.

The condition improves if the worker gives up underground work, but tends to recur if he resumes it.

Two means of prevention are urgently needed: first, medical examination of all boys who desire to become miners in order to eliminate those with errors of refraction; secondly, introduction of more powerful safety lamps. Electric safety lamps are now available, and where introduced, the prevalence has rapidly diminished.

*Lead Poisoning.*—This disease affords an excellent instance of control guided by previous investigation and research, opportunities for which were provided by notification of the cases. Lead poisoning of industrial origin was made notifiable in 1895. Distribution of cases by industry and numbers employed then showed that exposure in manipulating metallic lead or moist lead salts was almost a negligible factor in causing the disease; and that the governing risk was exposure to dust of lead salts soluble in the body fluids. Animal experiments proved that a dose of lead-dust when inhaled was a hundred times more toxic than when administered in food. Clearly preventive measures based, according to previous theories, on personal cleanliness, but which neglected the danger from inhalation of dust and fumes, could not be expected to stop the disease. In Great Britain Dr. T. M. Legge of the Home Office, to whom credit is due for recognizing the particularly toxic nature of lead-dust when inhaled, concentrated attention upon preventing the generation of dust and fumes or upon removing them, if generated, from the atmosphere of work-places. This principle underlies a series of regulations applied to industries in which lead compounds are used, *e.g.* the manufacture of electric accumulators and of white lead, vitreous enameling, file-cutting, smelting of materials containing lead, the manufacture of paints and of pottery, tinning of hollow-ware, and heading of yarn. The result of action on these lines has been remarkable; 1,058 cases of lead poisoning were notified in Great Britain in 1900. Since 1900 industries have expanded so that many more persons are now exposed to risk; and in 1906 lead poisoning was made a compensation disease, a factor which temporarily increased the notifications and tends to maintain them. Yet in 1918 the cases notified had fallen to 144 and in 1919 to 206.

Plumbism may be divided into two groups of cases: one, which occurs in the early weeks and months of employment, is characterized by such symptoms as acute colic and encephalopathy; the second, which occurs after years of exposure, is characterized by nerve paralysis and chronic nephritis. The first group contains the vast majority of cases, and its disappearance in later years points to some degree to immunity having been acquired through continued exposure to subminimal toxic doses. Lead poisoning in this respect presents aspects of disease of which industry supplies other instances; some exhibiting a prevalence which diminishes with length of exposure to risk, some one which increases with exposure to risk.

*General Considerations.*—Mill fever, which affects most operatives on entering the cotton or flax industry, and certain forms of dermatitis, *e.g.* eczema and conjunctivitis due to contact with tetryl, and skin irritation from slag wool, provide examples of troubles which rapidly disappear with continued employment and do not reappear. On the other hand miners' nystagmus, Dupuytren's contraction, pitch and paraffin cancer, bronchitis and pneumonia due to dust, cotton strippers' asthma, pulmonary silicosis, glass-blowers' cataract, phosphorus necrosis, and such trade neuroses as writers' cramp and telegraphists' cramp, are conditions which steadily increase in numbers with length of employment.

Other diseases resemble plumbism in presenting both early and late manifestations. Thus reference has already been made to the high incidence of accidents during early weeks and months of employment; with advancing years as bodily activity declines, *i.e.* as the person becomes more sensitized to risk, the tendency to accidents again arises. Tri-nitro-toluene (T.N.T.) during the war caused

toxic jaundice among munition workers, but hardly any cases occurred among those who had been employed over six months; it also caused aplastic anaemia, a condition which was rarer and only appeared among those who had been employed for a considerable period. Phthisis also presents some similarities, for there is evidence that exposure to a subminimal dose may result in increased resistance; possibly the tendency for the curves representing the phthisis mortality of boot-makers and general labourers to fall towards that of the standard after middle life indicates some degree of acquired immunity; on the other hand tuberculosis among those sensitized by inhaling silica-dust shows no signs of falling off in later years, and may be held to be analogous to the late group of plumbism cases, the aplastic anaemia cases, and accidents in late life.

There are, however, trade diseases which appear to have no relation to the period of employment. The incidence of these depends directly on exposure to risk; among these diseases are anthrax, caisson disease, and gassing from carbon monoxide, nitrous fumes, and arseniuretted, sulphuretted or phosphoretted hydrogen. These diseases, however, are rare, and their causation and prevention is comparatively well understood.

The lesson which emerges is that although the human body often possesses a capacity which requires no sensitization to succumb when exposed to certain unusual risks, it also possesses a capacity for defending itself against risk if the exposure is long continued. On the other hand certain influences such as alcohol, over-fatigue, lead, dietetic insufficiency, or silica-dust, can gradually sensitize the body, even to the extent of breaking down an acquired immunity, so that it finally succumbs where it formerly resisted. The methods by which immunity is acquired (as against such a thing as tetryl) and by which it is lost through sensitization (as by inhaling silica) both probably await biochemical research to explain their meaning. The problems associated with occurrence of trade neuroses, on the other hand, call primarily for physiological investigation into the normal mechanism of coördinated and balanced nervous control.

Industrial medicine, in which the absence of a disease in any group of workers may go far to explain its causation in another allied group, provides unique opportunities for studying the normal physiological elasticity of health and the way in which it may be overstrained and give place to disease.

**INDUSTRIAL WORKERS OF THE WORLD, THE.**—A union of wage-earners in the United States, organized in 1905, with a membership in 1920 of about 100,000, commonly spoken of as the I.W.W. (For a discussion of the I.W.W. *see* TRADE UNIONS.)

**INFANTILE MORTALITY.**—Since 1910, the social importance of measures for reducing the rate of infantile mortality, which means the number of deaths under one year of age per thousand births, still-births being excluded from both figures, has come into increased prominence. The problem involved, however, presented special difficulty early in 1921 to anyone who sought to deal with it authoritatively, since the World War had upset all calculations and statistics. In some cases, as in all the central European countries, the infantile death-rate had increased to a really appalling extent. One competent observer, for example, during a prolonged stay in Vienna, did not notice one "toddler" in the streets. On the other hand, there was, according to the British Registrar-General's reports for 1919, an apparent fall in infantile death-rate. No contemporary figures were yet available from the central European countries. Moreover, during the war, so great had been the pressure of work in all the countries involved that the statistical returns required, from which to draw conclusions of any lasting value, were perforce allowed to lapse.

A great deal of interesting information is to be found in Professor Starling's *Report on Food Conditions in Germany with Memoranda on Agricultural Conditions and Statistics*, published in 1919 (Cd. 280). The great outstanding difference between Great Britain and Germany in this respect was that of distribution. In England the control of distribution was facilitated by the fact that 80% of the grain and 45% of meat and all the oil-seeds consumed in the country were imported, and therefore could be controlled by the administration from the moment of their arrival. In Germany the whole of the supplies were produced in the country and had to be obtained from the large and small farmers. Thus a highly complicated and very difficult method of collection and distribution had to be followed, and grievous mistakes were made. Much more hoarding took place in Germany than in England, and the producers were far better fed than were the non-producers. The food shortage therefore was mainly experienced by the inhabitants of large towns and industrial areas. These observations are borne out by such books as *An English Wife's Life in Berlin during the War* by Princess Blücher. Moreover the German authorities felt themselves obliged to attempt to ration strictly the whole food of the population, and no such system as this can succeed without mass feeding. No two individuals are alike; one will need more food than the other. In England rationing was wisely confined to certain articles, such as meat, fats and sugar,—leaving bread, the chief food of the poor, unrationed, so that each individual could obtain of this as much as he required.

In Germany, in common with the other belligerent countries, as a result of the absence of the adult male population, the birth-rate went down. In addition to this cause the diminished fertility of the population owing to chronic underfeeding of both sexes must be taken into account. The birth-rate in Germany dropped from 27·5 per 1,000 in 1913 to 15·83 in 1916, and 14·29 in 1917, so that the number of births at the last date was well below the number of deaths, and in 1918 the deaths per 1,000 were 16·30 as compared with births 9·45, or a surplus of deaths per 1,000 of 7·35. In spite of the condition of malnutrition of the mothers, the children were normal when born, a state of things borne out by observations everywhere. Their further development was of course hampered by the lack of nourishment of their mothers, as well as by the defective supply of cows' milk. The pre-war milk consumed by Berlin was 1,250,000 litres, which during the war diminished to 225,000 litres, an amount totally inadequate to the necessities of the babies. How large a share the question of distribution had in the increase of infantile mortality in Germany was shown by the statement issued by the Belgian Relief Commission. Owing to the uniform feeding there was very little evidence of serious malnutrition among the inhabitants of Belgium, and the mortality among the children during the years of German occupation was less than before the war. It is highly gratifying to know that infantile mortality was steadily dropping throughout the world during 1900–20. It is true that the birth-rate was also dropping. The time was not yet ripe in 1921 to attempt to estimate the total loss of births caused by the war.

### UNITED KINGDOM

The births registered in the United Kingdom during the years 1910–4 were 4,411,823 as against 3,623,579 during an equal period of time 1915–9, a difference of 788,244. But the numbers born were already decreasing before the war notwithstanding the increase of population, so the whole diminution should not fairly be attributed to this cause. Also there has been a great recent rebound of fertility, not yet at an end in 1921, which may be regarded as a partial offset. The British birth-rate during 1919 went up in all districts except Wales, where, contrary to the usual experience, it went down. The increased rate was specially marked in London.

The British death-rate among male infants is always steadily higher than is that among female ones, and this rate has apparently been rising, though there was a curious drop in 1918. Taking the years 1911–19, 120 male to 100 female babies died, and this rate steadily increased till 1919 when it reached 124, having dropped in 1918 however to 114. The infant deaths registered for the year 1919, according to the latest figures available, were 12·2% of all deaths at all ages. The total number who died were 61,715. This proportion has fallen very rapidly of late years, not only because of fewer deaths, but also of fewer births. The percentage of infantile deaths of the total number as recently as 1901–10 was 22·6.

The rate of infantile mortality resulting from these deaths during 1919 was 89 per 1,000 births, or 15·2% below the average of the previous 10 years. It was the lowest rate that had yet occurred in the United Kingdom, the nearest to it being 95 in 1912.

As to the causes for this decreased rate, opinions seem to vary according to the view point of the person expressing the opinion. For example, the Board of Education officials were inclined to attribute it to the greater educational advantages enjoyed by the mothers through the establishment of their infant welfare centres. Improved sanitation is considered by others to have had great effect. Others again consider that the national campaign against venereal disease had probably had a considerable share in it; others the lessened employment of women in factories, and yet others the weakened strength of alcoholic beverages. Practically all these suggestions, as anything more than simply contributory to causation, are discounted by the fact of 1912 being so much lower than the years preceding and following it up to 1919.

The mortality rate in the case of illegitimate is very considerably higher than in the case of legitimate babies. In London during 1919 the total deaths of legitimate babies in 1,000 births was 77; in the case of illegitimate babies the total number was 233. This was the case in every area in the United Kingdom as the following table shows:—

*Infantile deaths from all causes in proportion to 1,000 births.*

| | All Infants | Legitimate | Illegitimate |
|---|---|---|---|
| London | 85·30 | 76·57 | 232·91 |
| County Boroughs | 98·62 | 92·56 | 195·27 |
| Other Urban Districts | 85·69 | 81·88 | 153·61 |
| Rural Districts | 80·46 | 76·57 | 136·16 |
| All Urban Districts | 91·25 | 85·48 | 182·68 |

This higher rate of mortality is maintained in practically every cause of death, the exceptions being that in London and other urban districts fewer deaths from whooping-cough occurred in the illegitimate babies, and in country districts fewer from tuberculous meningitis.

If we take the three main reasons for infantile death-rate, viz.: diarrhoea and enteritis, syphilis, and premature birth, we find:—

*Deaths from diarrhoea and enteritis, proportion per 1,000 births.*

| | All Infants | Legitimate | Illegitimate |
|---|---|---|---|
| London | .. | 12·49 | 52·96 |
| County Boroughs | .. | 8·96 | 28·55 |
| Other Urban Districts | .. | 6·51 | 18·89 |
| Rural Districts | .. | 4·74 | 9·91 |
| All Urban Districts | .. | 8·46 | 27·82 |

*Deaths from syphilis.*

| | All Infants | Legitimate | Illegitimate |
|---|---|---|---|
| London | 2·10 | 1·18 | 17·58 |
| County Boroughs | 2·56 | 1·84 | 14·03 |
| Other Urban Districts | 1·37 | 0·91 | 8·42 |
| Rural Districts | 0·86 | 0·48 | 5·41 |
| All Urban Districts | 1·99 | 1·35 | 12·12 |

The infantile mortality from syphilis in 1919 was still higher than before 1917, when it underwent a sudden and considerable increase, though it was still not so high (at 1·76) as in 1917, when it reached 2·03 per 1,000 births.

Taking birth conditions generally in 1919, *i.e.* injury at birth, congenital malformations, premature birth and atrophy debe, and marasmus, we find:—

| | Legitimate | Illegitimate |
|---|---|---|
| London | 7·86 | 20·51 |
| County Boroughs | 9·28 | 17·47 |
| Other Urban Districts | 8·77 | 14·75 |
| Rural Districts | 8·57 | 14·64 |
| All Urban Districts | 8·85 | 16·74 |

The rates for illegitimate children followed the same lines roughly as the legitimate ones, viz.: the death-rate increased from south to north, being generally lowest in the residential towns of the south, and highest in the industrial towns of the north. For infants of both sexes jointly the mortality varied during 1919 from 108 deaths per 1,000 births in the county boroughs of the north to 64 in the rural districts of the south. In rural districts, however, it is quite common for infant mortality during the first four weeks of life to be higher than the urban mortality. This is of course because environment conditions other than those of birth itself have not had time to tell. This increased rural mortality is very rare after the first month of life. The birth risk in the rural districts of the north was certainly at its maximum, for much the highest rate for the first day was returned by those areas. There was a similar rural excess during 1919 in Wales, though not in other parts of England, so that if defective midwifery in remote districts is the cause, it does not seem to apply to the Midlands and the south of England. In 1917, on the other hand, first-day mortality was in excess in all the rural districts with the excess still greatest in the north.

Two former causes of infantile deaths that have been tending to disappear altogether, are rickets and tuberculous meningitis. Indeed the marked fall in the mortality of age period 0–5, which necessarily includes mortality of children under one year, from tuberculosis generally, is very noticeable, and was greatly accelerated during 1919. Formerly it was the highest at any age, but it is now exceeded by most of the adult life periods.

*Infectious Diseases.*—The infectious diseases which influence the infantile death-rate are measles, scarlet fever and whooping-cough. With regard to measles, the death-rate of 1919 was by far the lowest ever recorded. It was much the greatest in the north of England, and since 1912 it has been noted as being the greatest in the large towns. Thus Cumberland, Durham, Northumberland and the North Riding, all in the north, showed the highest mortality, and in spite of the low mortality-rate in the country generally, Middlesbrough and Rotherham remained very high. The total deaths from measles in children under one year in 1919 was 650, or 1·05 % of the infantile deaths.

In the case of scarlet fever, the same high mortality occurs in the north in all areas whether country or town, compared with the south and with Wales; Birkenhead, Bootle, St. Helens and Liverpool head the list as they did in the previous year. The total deaths from scarlet fever in infants under one year for 1919 was 32, or ·051 % of all infantile deaths.

The death-rate from whooping-cough was the lowest ever recorded. There was a marked excess in the case of females, which is constant. The proportion of infantile deaths to the total number of deaths from whooping-cough naturally fell with the diminished birth-rate, but it is a curious fact that it was higher in rural districts than in small towns, and in small towns than in county boroughs. The cause of this persistent characteristic it was impossible at present to discover. It was not shared by measles, which was the only other infectious disease causing infantile mortality to any marked extent. The total number of deaths from whooping-cough under one year was 1,054, or 1·7 % of all infantile deaths.

*Enteritis and Diarrhoea.*—Diarrhoea as a cause of death is gradually disappearing from the British returns. This is also the case with tubercle and convulsions. The mortality ascribed to tubercle in 1919 was less than one-third, and convulsions less than one-half of that so returned 14 years earlier. In the case of these two latter diseases it is probably very largely one of nomenclature, whereas in that of diarrhoea it presumably represents in the main an actual decrease of mortality. During 1919 there was a lower infant mortality from diarrhoea and enteritis than ever before, except in 1912, when there were remarkably favourable weather conditions, even better than those in 1919. In 1911, a year with an almost tropical summer, the infantile deaths from these causes were 31,900 compared with 6,039 in 1919, the total infantile deaths being 114,600 and 61,715 respectively.

*Syphilis* shows a steady decrease compared with the startling rise in 1917, but it had not yet in 1919 attained its pre-war level as a cause of infantile mortality. As in the two previous years, mortality from syphilis was in considerable increase in the north.

*Developmental and Wasting Diseases*, notwithstanding an increase in 1919 in the first month, showed in that year the mortality of 10·3 per 1,000 births, the lowest ever recorded for England and Wales. By far the most important increase was that due to premature birth. This accounted for 59 % of the total increase of mortality during the first four weeks of life. Injury at birth also showed a considerable rise, which increase was entirely confined to male infants, whose mortality had risen from 1·11 to 1·34, whereas that of females had remained stationary at 0·85. As the British Registrar-General says: "It looks as if the infants born during 1919 were for some reason exceptionally susceptible to death within the month." This cause of infant mortality was, like so many others, excessive in the north of England, and mainly in the rural districts where it caused a mortality of 1·91 as compared with 1·11 for the country at large. Rural mortality from birth injury was high, and as the health and general condition of the mothers is likely to be better than in towns, it looks as if defective midwifery might be at least a contributory cause. As higher mortality is attributed to premature birth in the north as a whole than elsewhere, the facts of the greater industrial employment of married women in the north might be pointed to as a cause, but mortality from this cause declined during the early part of the war, reaching a minimum in 1916, and increased after the war together with the increased employment of women. Speaking generally, it looks as if a baby born north of the Wash had less chance of surviving than if it were born in the south.

"*Overlying.*"—This cause of infant mortality deserves separate mention. It was very much lower in 1919 than it had ever been before, being 0·76 per 1,000 births, or less than half of what it was a few years before the war. But Dr. W. A. Brend throws some doubt on this as a genuine cause of death. See *Health and the State*, 1917, as well as *Inquiry into the Statistics of Deaths from Violence*, 1915, in which he shows that there is no connexion between overcrowding and deaths from overlying, and that the seasonal variation follows that of bronchitis and pneumonia, being considerably higher in the first and fourth quarters of the year than in the second and third. This is borne out by the figures furnished by the Medical Officers of Health for Liverpool and Birmingham for 1919 and 1920. Thus in Liverpool in 1919 there were 18 deaths from this cause in the first and fourth quarters, and 7 in the second and third; and in 1920, 17 and 6 respectively. In Birmingham in 1919, the figures were 23 for

the first and fourth quarters, and 10 for the second and third; in 1920 they were 16 and 11 respectively. The fact of expert pathologists very rarely finding overlying a cause of death, but some other quite different cause, such as pneumonia, lends some support to Dr. Brend's contention.

*Housing* is a most important condition of infant mortality. Where there is most overcrowding, there is the highest death-rate. Of all children who die in Glasgow before they complete their fifth year, 30% die in houses of one room, and not 2% in houses of five rooms and upwards.

*Vital Statistics of Large Towns:—London.*—We find that the London infant mortality rate in 1919 was 85 compared with 108 in 1918. The birth-rate was 18·2 compared with 16 in 1918.

The following table published in the report of the Medical Officer of Health for London shows very clearly one great cause of lessened infantile mortality in cool summers and mild winters:—

| | 1911 | 1912 | 1913 | 1914 | 1915 | 1916 | 1917 | 1918 | 1919 |
|---|---|---|---|---|---|---|---|---|---|
| 1st quarter . . | 108 | 95 | 116 | 96 | 111 | 92 | 115 | 125 | 118 |
| 2nd " . . | 89 | 82 | 81 | 79 | 93 | 73 | 85 | 90 | 70 |
| 3rd " . . | 203 | 81 | 105 | 127 | 113 | 82 | 88 | 85 | 72 |
| 4th " . . | 113 | 103 | 115 | 109 | 126 | 103 | 114 | 117 | 76 |

The high figure in the first quarter of 1919 was due to influenza. The third quarter was the lowest ever recorded and may usefully be compared with the third quarter of 1911 when the heat in the latter part of the summer was almost tropical. The factor which mainly contributed to the low death-rate was the remarkably small number of deaths from measles and whooping-cough, which were 55 and 72 respectively as compared with 276 and 498 for 1918. Diarrhoea however showed an increase, there being 1,217 deaths, as compared with 970 in 1918, which was due to a period of high temperature late in the summer.

The number of deaths of nurse infants during 1919 was only 51 as compared with 103 in 1918. Foster-mothers were encouraged to take their children to infant welfare centres, and visitors followed up to see if the advice given had been carried out.

It is interesting to study the incidence of infant mortality in the different boroughs of the County of London. For example, the highest rates in 1919 were in Kensington, Shoreditch and the City of London with 102, 106 and 115 respectively. The lowest three were Lewisham with 62, Wandsworth with 72 and Battersea with 74, the rest varying from 81–99 per 1,000 births.

The deaths from enteritis and diarrhoea were greatest in Kensington, Hammersmith and Bethnal Green with 30·5, 29·8 and 26·5 respectively, and lowest in Lewisham, Woolwich and the City of London with 5·6, 6·6 and 7·2 respectively. The highest birth-rate was in Poplar with 24·7 per 1,000 of population, and lowest in the City of London with 9·6. These two districts had very nearly the same infantile death-rate, 14·5 and 14·3 respectively.

*Birmingham.*—The infantile mortality-rate in 1919 was 84, and in 1920 even lower, viz.: 83. This diminution is most striking in the poorer parts of the city. Thus St. Mary's Ward, which for many years held the record for a high infantile mortality, had a mortality of 103, or a drop of 80 as compared with the rate for the years 1912–18 of 183.

An interesting table showing the total infantile mortality rate and the rate with diarrhoea and enteritis taken out is given below. It is really put in to show that the diminution is not due only to cool summers, but it is a very striking evidence of that atmospheric effect as a contributory cause. Thus in 1911 there was a mortality rate of 47 per 1,000 from this cause, and in 1912 a rate of 9 only—this was a year with a very cool summer. It is true that this rate was exceeded every year since, though it never approached 1911, till 1919 when we have a further drop to eight.

| | Total mortality rate | Infant mortality less diarrhoea and enteritis | Deaths from diarrhoea and enteritis per 1,000 |
|---|---|---|---|
| 1911 | 150 | 103 | 47 |
| 1912 | 111 | 102 | 9 |
| 1913 | 129 | 100 | 29 |
| 1914 | 122 | 100 | 22 |
| 1915 | 118 | 95 | 23 |
| 1916 | 104 | 90 | 14 |
| 1917 | 101 | 89 | 12 |
| 1918 | 99 | 84 | 15 |
| 1919 | 84 | 76 | 8 |

There can be little doubt that after the appalling rate of 1911 all varieties of infant welfare work were pushed forward and were subsequently begun, but it seems impossible to doubt that the absence of tropical heat must certainly be given credit for part of it. It remained to be seen what would happen in the event of great summer heat occurring again. The illegitimate death-rate was 177 compared with 84 amongst the total births, *i.e.* over a double rate, very much the same as is shown in most other tables. An analysis of the figures of total deaths in infants under one year shows the effect of the colder parts of the year.

| | | | | | | |
|---|---|---|---|---|---|---|
| In 1919 during the | 1st | quarter | of the year | 554 | infants | died. |
| " " " " | 2nd | " " " | 291 | " | " | |
| " " " " | 3rd | " " " | 315 | " | " | |
| " " " " | 4th | " " " | 470 | " | " | |
| | | | | 1,630 | | |

*Liverpool* had in 1919 a considerably higher birth-rate than the average of the great towns, being 23·9 per 1,000 of population compared with 19, and at the end of 1919 the birth-rate was going up. The infantile death-rate varied from 136 to 81, giving an average for the city of 110. Examination of the figures for the first 20 years of the century shows in common with all other figures examined in other places a marked drop in 1912, with a slight rise in 1913, 1914, and 1915, and a distinct fall for 1916, 1917, and with a slight rise for 1918, and a still lower rate (by far the lowest on record) for 1919.

The statement is made, and is often borne out, that a high birth-rate means a high infant mortality rate. This is not so in certain districts of Liverpool. For example, in the Everton district there were 3,240 births with a death-rate per 1,000 births of 109, whereas in the Exchange district, with 922 births, the death-rate was 127. On inquiry we find that the Everton district is the most densely populated district of the city, containing 176 persons to the acre, but the inhabitants are of the respectable artisan type, such as railwaymen, carters, painters, etc. The houses, although small and closely aggregated, generally contain six rooms with a small back-yard, and are of a better type than those found in Exchange district, which is one of the oldest districts in the city, and is closely populated mostly with persons of the labouring class. The men are employed to a great extent about the docks and many of the women are hawkers and such like. Nearly 40% of all infant deaths takes place within the first four weeks.

There has been a marked decrease in drunkenness among women, due in part to restricted hours, but probably also to the weaker nature of the beverage, as well as to better wages which mean better food and improved conditions generally. No woman is noted as having died from excessive drinking in 1919, whereas 50 died in 1914, and 38 in 1915.

Speaking generally, it is the experience of the United Kingdom that infant mortality, though steadily going down, was in 1921 still far too high, but there was probably an irreducible minimum which might be taken as somewhere about 30 per 1,000 births, and might be regarded as accidental and to a large extent unavoidable. In Liverpool, for example, the deaths noted in 1919 under congenital malformation were 56 out of a total number of births of 2,055, or a death-rate of 27 per 1,000.

The lines on which we may expect further diminution are many, and cannot be regarded as due to any one cause, or group of causes, such as sanitary improvements or climatic conditions. The quickening of late years of the public conscience upon the subject, as well as the increased value put on all infant life owing to the immense loss of life during the war, have a very large share in the diminution of infant mortality.

## UNITED STATES

Although accurate statistics of infant mortality in the United States were lacking until recent years, practical interest in the subject was shown as early as 1893, when Nathan Straus established infant milk stations in New York City for the purpose of providing pasteurized milk for infants. After that time there were sporadic efforts in various parts of the country to protect infants. Municipal or state effort was unknown until 1908, when the City of New York established the Bureau of Child Hygiene. On April 9 1912 the U.S. Government established the Children's Bureau under the U.S. Department of Labor, one of whose functions was to investigate matters relating to infants' welfare. Between that time and the end of 1921 35 states established bureaus or divisions of child hygiene, and such municipal organizations for the same purpose became common. In addition to these Governmental enterprises, private and semi-private organizations did excellent work in many communities

In order to conform to the practice of other countries, it would be necessary to use as a standard the annual number of deaths of infants under one year of age per thousand living births occurring in the same area. But birth registration in the United States has been noticeably lax. The area of state birth registration, originating 1915, was at the end of 1919:

States Included in the U.S. Birth Registration Area, 1919.

| State | Year Admitted | State | Year Admitted |
|---|---|---|---|
| Connecticut | 1915 | Indiana | 1917 |
| Maine | 1915 | Kansas | 1917 |
| Massachusetts | 1915 | Kentucky | 1917 |
| Michigan | 1915 | North Carolina | 1917 |
| Minnesota | 1915 | Ohio | 1917 |
| New Hampshire | 1915 | Utah | 1917 |
| New York | 1915 | Virginia | 1917 |
| Pennsylvania | 1915 | Washington | 1917 |
| Rhode Island[1] | 1915 | Wisconsin | 1917 |
| Vermont | 1915 | California | 1919 |
| District of Columbia[2] | 1915 | Oregon | 1919 |
| Maryland | 1916 | South Carolina | 1919 |

The pop. in the birth registration area for 1915 was 31% of the total estimated pop. of the United States. In 1919 this had increased to about 58%. During a slightly longer period of time, 149 cities were included in the registration area.

The standard accepted by the U.S. Census Bureau is based upon what is known as the Model Law, and its requirements are:

1. Registration of births within 10 days.
2. Use of standard birth certificates.
3. Checks on registration, chiefly by (a) tracing records of deaths of infants under one year of age to see whether birth was recorded, and (b) tracing records of births reported in newspapers.
4. The work of an efficient state registrar possessing full power and responsibility to enforce the law, in direct connexion with local registrars.
5. Prompt monthly returns of the original certificates from the local registrars to the state registrar, with report of "no births" or "no deaths" where such is the case, and official statement of completeness of registration or report of delinquents.
6. Enforcement of penalties for non-compliance.

It was reported in 1921 that no state had obtained complete registration of births. The statistics in the area, however, were generally assumed to be approximately correct. It is evident, therefore, that infant mortality statistics in the United States, up to the end of 1921, were based entirely upon births reported in the registration area and that the total mortality must be estimated. It was believed, however, that the infant death rates in the states having unsatisfactory registration of births do not differ essentially from those recorded in the birth registration area.

Infant Mortality in the United States and Some Foreign Countries or Provinces (per 1,000 living births).

| | | | |
|---|---|---|---|
| Chile (1919) | 306 | Denmark (1919) | 92 |
| Hungary (1915) | 264 | England and Wales (1919) | 89 |
| Spain (1918) | 183 | Ireland (1919) | 88 |
| Japan (1917) | 173 | Switzerland (1918) | 88 |
| Germany (1918) | 154 | United States (birth registration area, 1919) | 87 |
| Italy (1915) | 147 | Netherlands (1919) | 84 |
| Quebec (1917) | 138 | Sweden (1915) | 76 |
| France (1919, 77 departments) | 119 | Australia (1919) | 69 |
| Finland (1917) | 118 | Norway (1917) | 54 |
| Scotland (1919) | 102 | New Zealand (1919) | 45 |
| Uruguay (1919) | 101 | | |
| Ontario (1918) | 99 | | |

Note: The figures given are the latest available. It is possible that the relative position of the United States would vary if all the statistics were for 1919.

There was a steady and persistent decline in the rates in the birth registration area during 1916–21 with the exception of the year 1918, when there was an increase over the preceding year, due very largely to an epidemic of influenza. The further reduction of the infant death-rate to 87 during the year 1919 supports the belief that the factors which had to do with the general reduction of the rate were exercising a cumulative and progressive effect.

Infant Mortality Rates, U.S. Birth Registration Area, 1915–9.

| | Deaths per 1,000 births | | | | |
|---|---|---|---|---|---|
| | 1919 | 1918 | 1917 | 1916 | 1915 |
| Registration area (total) | 87 | 101 | 94 | 101 | 100 |
| Whites | 83 | 97 | 91 | 99 | 99 |
| Negroes | 131 | 161 | 151 | 185 | 181 |

The rate for 1919 showed that of every 12 infants born alive, one died before reaching the age of one year.

[1] Dropped from registration area in 1919.
[2] Included in registration states.

Infant Mortality Rates, U.S. Birth Registration Area, 1915–9, by Cities and Rural Communities.

| | Deaths per 1,000 births | | | | |
|---|---|---|---|---|---|
| | 1919 | 1918 | 1917 | 1916 | 1915 |
| Cities in the registration area (total) | 89 | 108 | 100 | 104 | 103 |
| Whites | 86 | 105 | 96 | 102 | 102 |
| Negroes | 148 | 197 | 185 | 177 | 181 |
| Rural part of the registration area (total) | 84 | 94 | 88 | 97 | 94 |
| Whites | 80 | 90 | 84 | 95 | 94 |
| Negroes | 123 | 143 | 134 | 203 | 182 |

Study of the infant death-rates in the registration area shows high rates for negroes in both cities and rural communities. This racial characteristic affects the rates in the various states.

Rates in the States of the Birth Registration Area, 1919.

|---|---|---|---|
| All States | 87 | 89 | 84 |
| California | 70 | 64 | 79 |
| Connecticut | 86 | 86 | 87 |
| Indiana | 79 | 88 | 74 |
| Kansas | 70 | 88 | 65 |
| Kentucky | 82 | 105 | 78 |
| Maine | 91 | 89 | 91 |
| Maryland | 105 | 98 | 115 |
| Massachusetts | 88 | 90 | 82 |
| Michigan | 90 | 97 | 82 |
| Minnesota | 67 | 68 | 66 |
| New Hampshire | 93 | 101 | 85 |
| New York | 84 | 85 | 77 |
| North Carolina | 84 | 124 | 82 |
| Ohio | 90 | 94 | 85 |
| Oregon | 63 | 69 | 59 |
| Pennsylvania | 100 | 99 | 101 |
| South Carolina | 113 | 139 | 111 |
| Utah | 71 | 74 | 69 |
| Vermont | 85 | 121 | 79 |
| Virginia | 91 | 106 | 87 |
| Washington | 63 | 59 | 67 |
| Wisconsin | 80 | 94 | 71 |
| District of Columbia | 85 | 85 | — |

As will be seen, the rates vary from 63 in Oregon and Washington to 113 in South Carolina (for 1919).

Rates by Sex in the Birth Registration Area, 1919.

| | 1919 | 1918 |
|---|---|---|
| Males | 95·8 | 110·9 |
| Females | 77·0 | 90·4 |

The statistics of U.S. birth registration area show that the ratio of sex to infant mortality in that country is about the same as that in other countries. In all years reported, the death-rate of male infants is appreciably higher than the death-rate of female infants. This applies to both cities and rural communities, in 1919 the city rate for males being 98·7 as against a rural rate of 92·9, the city rate for females being 79·3 as against a rural rate of 74·7.

Rates for 10 Largest Cities of the United States 1914–20.

| | 1914 | 1915 | 1916 | 1917 | 1918 | 1919 | 1920 |
|---|---|---|---|---|---|---|---|
| New York | 94·6 | 98·1 | 93·1 | 88·8 | 91·7 | 81·6 | 85·4 |
| St. Louis[3] | 103·3 | 82·1 | 89·4 | 79·7 | 94·5 | 75·2 | 76·5 |
| Boston | 103·7 | 103·0 | 104·9 | 98·9 | 114·9 | 96·8 | 100·8 |
| Pittsburgh | 115·2 | 107·7 | 113·8 | 116·2 | 122·5 | 115·3 | 110·8 |
| Cleveland | 116·4 | 110·6 | 107·0 | 104·9 | 95·4 | 90·8 | 86·0 |
| Philadelphia | 117·6 | 106·2 | 101·0 | 110·0 | 126·0 | 89·8 | 88·6 |
| Buffalo | 121·5 | 108·2 | 113·9 | 103·7 | 121·5 | 109·8 | 101·0 |
| Detroit | 122·4 | 104·3 | 112·8 | 103·6 | 100·7 | 96·8 | 104·2 |
| Chicago[3] | 132·7 | 102·5 | 111·9 | 106·4 | 104·3 | 91·0 | 85·5 |
| Baltimore | 154·6 | 119·8 | 118·2 | 119·3 | 147·8 | 97·0 | 104·2 |

As the above table shows, New York City has had the lowest rate of any of the 10 largest cities of the United States in the years 1914–20 inclusive, except for St. Louis in 1915, 1916, 1917 and 1919. St. Louis is not in the birth registration area because its birth registration reports are not accepted by the U.S. Census Bureau.

*Rates in American Cities.*—Philip Van Ingen states that a report from 432 or 87·8% of the cities of the birth registration area, with a population of 30,063,288 or 95·2% of the total urban population of this area, shows the infant mortality rates for the five years 1915–20, grouped according to population, to be as follows:

| Population | 1916 | 1917 | 1918 | 1919 | 1920 |
|---|---|---|---|---|---|
| Over 250,000 | 98·8 | 95·4 | 102·3 | 87·0 | 88·6 |
| 100,000 to 250,000 | 103·1 | 100·8 | 111·8 | 91·0 | 92·2 |
| 50,000 to 100,000 | 105·3 | 98·8 | 103·3 | 89·9 | 92·3 |
| 25,000 to 50,000 | 103·8 | 99·9 | 107·9 | 91·0 | 90·3 |
| 10,000 to 25,000 | 105·8 | 100·8 | 114·1 | 94·7 | 91·5 |
| All cities in area | 101·4 | 97·6 | 105·7 | 89·1 | 90·2 |

[3] Not in birth registration area.

*Causes of Infant Mortality in the United States.*—It is probable that the variety of race groups in the United States has had a marked effect upon infant mortality. Statistical studies on this point are not readily available but the report of Dr. W. H. Guilfoy of New York City is worthy of mention. Dr. Guilfoy shows that out of every thousand infants born of mothers of Russian-Polish or Austro-Hungarian nationality, over 920 survive the first year of life; of Italian mothers 897; of native mothers 894; of German mothers 885; of Irish mothers 881. Other significant results of this analysis show that the nationality of the mother seems to be a predominant factor in deaths from congenital diseases under one year of age per 10,000 births reported. This rate in children born of Italian mothers was 295, of Russian mothers 320, Austro-Hungarian mothers 284 and native-born mothers 544. This clearly indicates that measures for the reduction of infant mortality in the United States in the future must take into consideration the high death-rate from congenital causes of infants of native-born parentage. The effect of nationality upon deaths by infectious diseases is shown in the fact that children of Italian mothers present the highest mortality in the group, with a rate of 58; children of Irish mothers rank next with a rate of 57; children of native-born mothers 38; children of Austro-Hungarian mothers 36. In respiratory diseases, race seems again to play an important part. The death-rate of infants of Italian mothers from acute respiratory diseases is more than three and one-half times that of children of German mothers, almost three times that of children of Russian, Austro-Hungarian and Irish mothers, and a little more than double that of native-born mothers. In diarrhoeal diseases, the racial aspect is shown as follows: The death-rate of infants of English mothers is 91 per 10,000 births, children of native-born mothers 80, children of Irish mothers 72, children of Italian mothers 70, children of Austro-Hungarian mothers 52, and children of Russian mothers 30.

The influence of race, as shown by these figures for New York City, would seem to indicate that the highest death-rate from congenital causes in infancy is among children of native-born mothers, the highest among infants from infectious diseases among children of Italian mothers, the highest rate from respiratory diseases among children of Italian mothers, and the highest rate from diarrhoeal diseases among children of English and native-born mothers.

Figures for the United States Registration area for 1919 are of interest in this connexion:

Rates Classified According to Country of Birth of Mother, 1919.

| Russia | 73·6 |
| Other foreign countries | 104·8 |
| Negroes (United States) | 134·3 |

*Age Groups as Factors in Infant Mortality.*—The well-known fact that people are susceptible to their environment in inverse proportion to their age is graphically demonstrated in the case of the infant death-rate by examination of age subdivisions of the first year of life. It is evident that the new-born infant is extremely susceptible to its environmental conditions and that intrauterine factors have an effect in making the infant mortality rate unusually high during the first few days or first month of life. It must be remembered that the intrauterine infant's environment is its mother and that anything that affects her health inevitably reacts upon the infant.

| Six to eight months | 10·3 |
| Nine to eleven months | 7·9 |

*Sanitation and Environment.*—Statistics regarding the effect of sanitation and environmental conditions on the infant death-rate are difficult, when not impossible, to obtain. Clinical and practical experience must be drawn upon to prove that lack of proper sanitation and poor hygiene cause infant deaths. It is generally accepted by child hygienists that the main factors in high rates are poverty and ignorance. The more definite causes of infant mortality due to lack of sanitation may be classified as those of social, economic and general environment. Although the direct relation of sanitation to the infant death-rate cannot be proved statistically, it has been proved many times by the marked fall in the infant death-rate when sanitary conditions in a community have shown improvement. The sanitary conditions affecting the infant death-rate may be classified from another point of view as decent housing, proper standard of living, opportunities for recreation and fresh air, clean water supply and clean milk supply.

Studies made by the Children's Bureau at Washington show that the infant death-rate is definitely affected by overcrowding, and that the number of people living in a room can be shown to have a direct statistical relation to the rate. Overcrowding has a direct relation to the economic condition of the family and is reflected in its general standard of living. Such factors, therefore, are not easily separated, but statistical studies have shown uncleanliness, overcrowding, lack of ventilation and lack of decent hygiene in the home are directly responsible for many infant deaths. In the same way, poverty can be shown to be allied to the rate by the fact that the rate bears a close and regular relation to the amount of wages received by the family. In the Johnstown report of the Children's Bureau, U.S. Department of Labor, definite figures are given in this regard. The results of that investigation showed that when the father earned less than $521 per year, the infant death-rate was 255·7; where the father earned more than $1,200, the infant death rate was 84. But wages must be considered again in relation to social and sanitary factors, as a decent standard of living may be maintained on a low wage-rate while a high wage-rate does not necessarily include conformity to hygienic requirements.

Poverty reacts upon infant mortality in still another direction. Insufficient earning capacity of the father usually forces the mother into industry. Statistics relating to the health of mothers who are industrially employed during their child-bearing life or during the period of pregnancy would seem to indicate that employment of these women, in itself, has no deleterious effect upon the infant. More detailed studies and more careful analysis of the studies already made would seem to indicate that the high rate in towns where women are industrially employed to any great extent is due not so much to the effect of the mother's industry upon the child, as to the conditions of poverty in the family that have forced the mother into industrial pursuits. In order to show conclusively that employment of women is a factor of importance in increasing the infant mortality rate, a further study should be made as to the effects of certain types of industry upon pregnant women. Probably one of the most harmful results of the employment of women, so far as infant mortality rates are concerned, is the fact that returning to the industry too soon after confinement is not only harmful to the health of the mother in relation to future pregnancies, but reacts disastrously upon the infant in that the latter usually is deprived of breast feeding.

*Type of Feeding.*—It has long been recognized that infant death-rates from diarrhoeal diseases are very markedly affected by the feeding employed. It has been proved beyond doubt that the infant death-rate from diarrhoeal diseases can be much reduced by the wider use of breast feeding and by the provision of safe, clean milk for use in artificial feeding. The relation of breast and artificial feeding to infant mortality is graphically shown in certain studies made in New York City. One such study, covering deaths of 1,065 infants from diarrhoeal diseases, showed that 17% of those who died had been breast-fed exclusively, while 83% had been artificially fed, either with cows' milk or some form of prepared infant food. In order to determine the extent of breast feeding among well children, a further study was made covering about 4,000 children between 3 and 12 months of age. In this study it was found that 79% of the babies were breast-fed exclusively while the remaining 21% were fed with bottled milk, or bottled milk and breast feeding combined. The experience of the Bureau of Child Hygiene of the Department of Health of the City of New York has shown that about 80% of the tenement population of that city nurse their babies exclusively, and that four-fifths of the high death-rates of infants from diarrhoeal diseases occur in that group of the infant population that is not breast-fed.

*Milk.*—Reduction of the infant death-rates in the various communities of the United States has followed very closely the improvement of the milk supply and the tendency towards general pasteurization of milk. The use of raw milk which has not been sufficiently protected in its production, transportation and in its care in the home is undoubtedly one of the most important factors in the causation of high death-rates from diarrhoeal diseases which occur so commonly among artificially fed infants. For these reasons any efforts which are directed towards obtaining a safer supply of milk for children may be classed as measures for the reduction of infant mortality.

*Congenital Diseases.*—Under the group classified as "congenital diseases" in the following table have been listed all deaths of infants from prematurity, feeble vitality and accidents of labor. This group, furnishing as it does over one-third of the total deaths during the first year of life, is of immense importance. Some cities, notably Boston and New York, have demonstrated that by the employment of public health nurses for the supervision of women

during their period of pregnancy; the observance by these women of all matters pertaining to timely hygiene; proper supervision and care in confinement, including adequate obstetrical and nursing care and provision for nursing supervision of the infant during the first month of life, it is possible to reduce the infant death-rate from congenital causes in the first month of life at least one-half, and, in many instances, two-thirds. Such results seem to show that the present high rates from congenital causes are unnecessary.

Percentage for Various Disease Groups, U.S. Birth Registration Area, 1919.

| | Total | Rural | Urban |
|---|---|---|---|
| Infectious diseases | 2·8 | 2·9 | 2·4 |
| Respiratory diseases | 14·8 | 13·5 | 16·2 |
| Diarrhoeal diseases | 18·2 | 15·7 | 20·5 |
| Congenital diseases | 42·7 | 41·6 | 44·0 |
| All other causes | 21·5 | 26·3 | 16·9 |
| | 100·0 | 100·0 | 100·0 |

*Diarrhoeal Diseases.*—The causes of infant mortality from diarrhoeal diseases already have been incidentally discussed. They may be summed up, however, as wrong methods of feeding, lack of hygiene, depressed vitality due to heat and lack of observance of the ordinary methods of hygienic care during infancy.

*Respiratory Diseases.*—The infant death-rate from respiratory diseases is largely the result of broncho-pneumonia, secondary to measles or whooping-cough. The effect of influenza upon the infant death-rate in the United States has been marked. The results, however, have been due not so much to infant deaths from influenza as to the fact that the mother has died from the disease and the infant, owing to deprivation of breast feeding, has been unable to resist the disease. Experience in public health work has seemed to show that the occurrence of respiratory diseases, in common with the occurrence of contagious diseases in infancy, is due very largely to improper methods of living and is closely allied to lack of ventilation of living-rooms and overcrowding of families.

*Contagious Diseases.*—This group furnishes only a small proportion of the total infant death-rate. Deaths in this classification are mainly those due to measles and whooping-cough, both of which must be considered as extremely dangerous diseases in infancy.

*National Maternity and Infant Welfare Law.*—Reference has been made to the efforts of the Children's Bureau of the Department of Labor, Washington, and the various state and other bureaus of child hygiene to reduce the infant death-rates of certain localities. The 67th Congress of the United States passed a bill "to promote the welfare and hygiene of maternity and infancy." This bill, signed by the President, was to be operative during five years. It provides that each state shall receive $10,000 outright, an additional $5,000 provided it appropriates an equal sum, and thereafter a *pro rata* share of approximately $1,000,000, based upon the population of the various states, provided, however, that the state in question raises an amount equal to this additional appropriation. The money thus given is to be used for the purposes stated in the bill, that is, promotion of maternity and infant welfare work. The general central administration of the act is to be carried out by the committee, composed of the surgeon-general of the U.S. Public Health Service, the U.S. Commissioner of Education and the chief of the Children's Bureau of the U.S. Department of Labor, the chief of the Children's Bureau being the executive officer. The purpose of this bill is to reduce the maternity and infant death-rates by helping the states to establish work of their own for the purpose.

**INFANTRY** (*see* 14.517).—To appreciate the lessons learned from the experience of infantry in the World War in relation to the past as well as to the future, it is necessary to emphasize one particular aspect of infantry evolution—the gradual decrease in size of the unit which one man can command. It is desirable also to visualize what "command" really implies. A corporal is said to "command" the squad of recruits which he is training on a barrack square; he does it by shouting words of command to them. Marshal Foch also "commanded" the Allied armies in western Europe in 1918; he did it, however, without raising his voice above its usual pitch. Between the Marshal and the corporal were a host of intermediate commanders of every sort, kind and description, but we are concerned here mainly with infantry commanders and especially with those in the junior ranks. For theirs is the hardest task in a battle, and it is upon them that success depends. "The wisest plans, the most thorough preparations, the most brilliant guidance avail nothing unless the fight is won by the fighters—by the platoons." The minds of superior officers therefore are devoted—especially in peace-time—to hard thinking on the problem of what they can possibly do or invent to make junior infantry commanders superior to the adversaries whom they are likely to meet in action. A general's command implies much forethought as well as some experience in its holder, and thus his "command" again has a different meaning. He is a trainer, and it is with respect to this part of "command" that we shall chiefly be concerned.

If we turn to the past for a moment, we find that the Greeks invented and trained their phalanx and the Romans their legion, and with these two systems the infantry arm dominated the known world for several centuries. Each of these tactical formations was based upon a most precise drill, executed almost daily by junior commanders. Moreover this drill was in each case suited to the age and the *esprit de corps* of the period. In battle the voice of the infantry superior could be heard and was instantly obeyed, both in the phalanx and the legion. Then ensued the Dark Ages and comparative chaos, which was dominated by feudal horse soldiers, until archery made infantry again supreme. Precise drill was at the root of the success of the archers, and fire orders were strictly enforced. If we take Crécy (1346) as an example, we find that Edward III. initiated fire orders himself, though he left the command of the front-line to his son, the youthful Prince of Wales in charge of the archers. A careful survey of the ground at Crécy from the commanding position of its windmill, in which King Edward was posted, enables one to see why it was possible for him to issue fire orders and instructions to the archers posted below him. They were only a few hundred yards from him, but he could see better than they could when the crowd of French cavaliers would offer the best target to the British longbowmen. These bowmen had under several reigns been disciplined and drilled with precision in the use of their weapons, and that is why they defeated the gallant but undisciplined mob of horsemen who attacked them without method at Crécy. It is also obvious that the diminutive size of that battle-field enabled the commander-in-chief, posted behind his reserve, to initiate fire orders and see their effect—in fact, he performed duties which now appertain to platoon commanders. Moreover, the size of the whole battle-field corresponded with a sector allotted to one battalion, or at most to two, in 1918. Thus the process of devolution of the physical command occupied some five centuries, chiefly because it took all that time to alter infantry armament from bows to Lewis guns; partly also because each generation of professional soldiers clung with punctilious tenacity to the admirable drill of a previous age. Similar tenacity is visible to-day, but changes are in the air. Frederick the Great (1740) attained parade-ground precision even during the shock of encounter, and won his battles by means of remorseless drill, stepping to music and machine-like fire tactics with inaccurate muskets. Such is the force of tradition in any army that in 1914, German companies in Flanders were trying to copy Frederick's tactics with the aid of song instead of a band to inspire their *Parademarsch* within close range of British infantry. But their opponent's rifles were accurate in 1914.

Frederick, however, did not teach one system on the barrack square and then practise a totally different one on active service; but that is what the British infantry did before the S. African War (1899) and what some soldiers would like it to do again. Their line of reasoning is that, as every war alters tactical formations, it is not of much avail to learn in peace-time tactics which will assuredly be discarded in the next war.

*British Infantry in 1913.*—In Oct. 1913 the British infantry underwent a drastic change, in spite of much opposition. The old "Eight Company" system was abolished, and the continental system was adopted of dividing the battalion into four companies, each 200 strong. This change gave a peace strength of about 100 men per company actually available for training. This admirable reform, which fortunately was accomplished on the verge of the World War, was effected by amalgamating two of the old companies to form one of the new and enlarged compa-

nies. Each company was then commanded by a major or captain, with a captain as second-in-command. Subaltern officers became the responsible and effective commanders of the four platoons into which the new companies were divided, and four of the sergeants who originally commanded sections of the old companies became platoon-sergeants and hence second-in-command. Thus one notable result of the change was to allot the responsibility of an executive rôle to the subaltern in place of the senior non-commissioned officer. The change rested on sound psychology, because the latter has generally proved less capable of initiative, though excellent as an adviser on account of his length of experience, and admirable as an executor of a definite order. The eight colour-sergeants of the old companies were allotted to the four new companies with the titles of company-sergeant-major and company-quartermaster-sergeant, the former for tactical, the latter for administrative duties.

The organization of a battalion at the beginning of the war was as follows:—Headquarters, machine-gun section (two guns), four companies. For purposes of administration the personnel of battalion headquarters—other than the battalion commander a lieutenant-colonel, the senior major, adjutant and quartermaster and the machine-gun section were unfortunately distributed to companies and platoons as supernumerary to their establishments. They should have been kept at battalion headquarters. A company consisted of company headquarters and four platoons, numbered from 1 to 12 throughout the battalion. A platoon was composed of four sections. A section was commanded by a non-commissioned officer and was the normal fire unit. Four battalions, from various regiments, were grouped to form a brigade. In the British army the regiment is simply a unit of sentiment and the spring from which *esprit de corps* arises. It is based on a fixed regimental depot which is the common link of battalions scattered over the British Empire. The four-company battalion marked a stepping-stone in the history of the British infantry, because the platoon became the "tactical" unit instead of the company. As a logical consequence the fire unit (section) decreased in size and became the command of a junior N.C.O.—a corporal or lance-corporal.

At first this change seemed incomprehensible to the lay mind because it was contrary to the idea that in modern war the improvement of communications tends to centralization and control by the higher authorities. But the extent of the modern battle-field and the increase and improvement of mechanical weapons tend to isolate and break up infantry units more than formerly. A further consequence of the change was that British infantry organization became based on a four-unit system from the brigade down to the platoon. This uniform distribution of units in multiples of four proved to be handier than the French and the German distribution in multiples of three. By the end of 1918 the four-unit system was pronounced to be the best, whether for tactics or administration or reliefs or daily routine—but especially for tactical handling in the field. One reason for this is that "odd" numbers destroy the even distribution of duties. In fact the French and German distribution was a three-cornered organization in more senses than one.

The outstanding defect of British pre-war preparations lay in the allotment of only two machine-guns to each battalion and none to a brigade. Another defect which soon became apparent was that the enhanced responsibilities of the company and platoon commanders were not accompanied as they should have been with increased disciplinary powers.

*Other Armies, 1914.*—In the German, French and U.S. armies the regiment consisted of three battalions, and was a tactical as well as an administrative unit. In Germany it was commanded by a colonel with a lieutenant-colonel as his second-in-command. The battalion, commanded by a major, was divided into four companies, each commanded by a captain. The company was divided into three sections (*Züge*) each under a subaltern who had as his understudy or second-in-command, either a sergeant-major, a "vice-sergeant-major" or a "sword-knot ensign" (aspirant-officer). On mobilization for war one additional officer was allotted to each company. Prior to mobilization every infantry regiment and Jäger battalion was provided with a machine-gun company of six guns, plus one spare. The French company was organized into four sections, commanded in war by three subalterns and one adjutant (superior company sergeant-major). The sections were grouped in pairs to constitute *pelotons* (platoons) under the senior of the two section leaders. In peace there were only two subalterns on the establishment for the four sections. Machine-gun sections were allotted to battalions as in the British army. In the United States the company was composed of three officers and 150 rifles, divided into two sections, each of three squads. In the World War, however, the U.S. infantry regiment was modelled on the continental form, having also a regimental machine-gun company, a headquarters company and a supply company.

Thus before the World War the infantry battalion was in almost every country about 1,000 rifles strong, allotted to four companies each commanded by a mounted officer. But the British battalion was the weakest in fighting strength, because its First Line Transport and other services were deducted from its 1,000 rifles, whereas the regimental systems of continental infantry provided these services from a separate regimental establishment. The subalterns were dismounted officers, whose commands varied as follows:—British 50 men, German 80 men, French 50 men, United States 75 men. But in the British infantry a large proportion of the 50 men borne on the strength of every platoon were absent on other duties. For instance, they were signallers, or machine-gunners, or bandsmen, or transport drivers, or pioneers—they were in fact everything except fighting infantrymen and these should have been struck off the rolls of the fighting platoons. The British Treasury, however, ordained otherwise, and thus made training and fighting difficult and sometimes impossible for the platoon commander.

*Changes during 1914–8.*—During the war the basic organization of the infantry of the belligerent powers was not materially altered. The changes were chiefly in the direction of additional weapons and a multiplication of kit, which reduced the infantry soldier to a beast of burden laden under a weight which destroyed his mobility. In 1915 the British infantry as compared with the German suffered from a paucity of heavy machine-guns, and was slow to increase its machine-gun strength. At first an increase was made (up to four per battalion), and when manufacturers increased their output these were formed into machine-gun companies. They were gradually divorced from the infantry and formed into a machine-gun corps, firstly as brigade machine-gun companies and finally as divisional battalions. By the time this had been accomplished, the lighter Lewis gun had made its appearance, and had been allotted definitely to infantry units. The first issue (not long before the battle of Loos, 1915) was only two or four guns per battalion, but by the end of Nov. 1915, when brigade machine-gun companies had been formed, the establishment of Lewis guns was beginning to increase. The tendency at first was to use this weapon like a heavy machine-gun and consequently as a battalion weapon, but when its characteristics were better understood it took its rightful place, first as a company weapon in 1916 and finally as a platoon weapon in Feb. 1917. Battalions were issued with 16 guns, *i.e.* one per platoon, but were so satisfied with this weapon that demands were submitted for a further supply. By March 1 1918 16 more guns for platoons and 4 for anti-aircraft work became available, making a total of 36 per battalion. We then find the platoon composed of four sections, two of which were armed with one Lewis gun each. The allotment of an automatic weapon on such a scale marked an important step in the tactics of infantry. One of these new weapons, handled by only two men, could deliver a stream of bullets equal in number to, and more accurately aimed than, what could formerly be projected by 25 soldiers with rifles. Obviously the number of men required in the forefront of the battle could now be reduced without affecting the volume of fire. This meant fewer casualties and bigger reserves for the arm without which battles cannot be won. Consequently, the maximum number of soldiers in every section was reduced to one leader and six men, making a total for all ranks of a platoon

only 31 actually taken into action. The change was dictated by the shortage of man-power, which threatened to deplete the ranks of the infantry. Any numbers over the 31 were to be left out of every battle as reënforcements, but few platoons ever numbered more than 20 men actually available after 1916.

The Germans were faced with the man-power problem before any of the other belligerents, and they also appreciated the value of the light machine-gun. In March 1917 they issued three to every company, and afterwards raised this allotment to six by giving two guns to each platoon. Finally, each German battalion consisted of a heavy machine-gun company of 12 guns, and three infantry companies armed with six light machine-guns each, without counting the special machine-gun companies allotted to divisions in every battle. This tremendous increase of automatic weapons had an inevitable effect on infantry formations. The costly attacks on narrow frontages were abandoned. The successive lines or waves of men gave place to open formations. The four sections of a platoon were gradually separated from one another and compelled to manœuvre and fight under their own leaders. When platoons were too weak to man four sections, they fought with only two, one of which was armed with a Lewis gun. The frontages allotted to attacking platoons were increased, and in some of the great battles of 1918 we find platoons attacking on frontages of 200 and even 300 yd. with very small effectives. Fire-power was at last understood.

In addition to the Lewis gun, rifle grenade, and hand grenade, the Stokes light mortar proved to be a most useful infantry weapon. Although it did not form an integral part of battalions, the brigade light-mortar batteries drew their personnel entirely from the infantry, and the mortars were allotted to battalions during operations. The light mortar was the nearest approach to an infantry gun in the British army, and though not an ideal weapon, rendered great help to battalions in reducing enemy machine-guns and strong points. The German mortars in the summer of 1918 were distributed as follows. Each regiment had a regimental "*minenwerfer*" company, organized in three sections, each with three light *minenwerfer* and in addition two or three medium *minenwerfer*. The important part played by these weapons in battle tended to prove that infantry, when scientifically armed, can become independent of other arms, and is capable of fighting its own local battle either with or without artillery support and tanks. To fulfil this rôle, however, it needs to be more highly and scientifically trained than before the World War. The importance of training the commanders of companies, platoons, and sections cannot be over-emphasized, and it was the shortage of these trained officers and non-commissioned officers which caused so much deterioration after the battle of Ypres in 1917.

*Organization in 1919.*—On Nov. 11 1918, the date of the Armistice, the British infantry battalion was organized in battalion headquarters and four companies, each company consisting of company headquarters and four platoons. Each platoon consisted of headquarters and four sections, two of which were armed with one Lewis gun each. Certain riflemen in the sections carried rifle and hand grenades. The platoon was the largest unit composed of men whose sole duty is to fight, and the war established it as the "tactical unit" of infantry. The section is, however, the fire unit upon which infantry organization is built. It consists of a leader and six men, a number which experience has proved the largest that can be directly controlled in action by one commander. It is therefore the "fire-unit" of the infantry. Thus the British subaltern officer's command in battle became 28 fighting men as compared with 50 in 1914—but it should be remembered that the two Lewis guns and the rifle grenade and hand grenade increased the fire-power of the platoon out of all proportion to the number of its men.

Meanwhile the German organization had undergone no fundamental change, though its battalions had decreased considerably in size. Previous to the offensive of March 21 1918, the German High Command had fixed the total establishment of an infantry battalion at 980 men including the machine-gun company. This establishment was reduced on July 1 1918 to 880 men (750 men for the four companies and 130 men for the machine-gun company). In the autumn of 1918 the strength of a normal German infantry battalion was estimated at 20 officers and 650 other ranks, including the machine-gun company, but, as a matter of fact, many German battalions mustered less than 300 men all told at the end of the war. Each battalion consisted of four companies and a machine-gun company. Companies were numbered 1 to 12 throughout the regiment; machine-gun companies were numbered 1, 2 and 3. A company was organized in three platoons, numbered 1, 2, 3 in each company. Each platoon (*Zug*) was divided into four sections commanded by corporals (*Unteroffizier*), numbered 1 to 12 throughout the company. The smallest subdivision was the section (*Gruppe*) under a lance-corporal, but many of the subdivisions became nominal under defeat in 1918.

*Post-war Organization.*—The basic structure of the post-war British battalion has remained that of the battalion of 1918, viz.: an organization of companies, platoons and sections on the four-unit system which has successfully passed the test of war and should remain unaltered, though administration is likely to be simplified. The peace strength will probably be 28 officers and 700 other ranks at home, the war strength over 1,000. The chief innovation will be the introduction of a fifth subdivision of the battalion, viz.: the headquarters wing. The interior organization of the four companies will be as in 1918 except that a separate company headquarters will contain both some fighting and the administrative portions of the company, namely, men who do not belong to or fight in platoons (*e.g.* company sergeant-major and company quartermaster-sergeant, company signallers and cooks). These will be borne on the strength of company headquarters and will free the platoons of the incubus of mere paper men. It is around the headquarters wing that the chief interest lies. This unit is the outcome of experience, for during the World War almost every experienced battalion commander formed a unit which was commonly called a headquarters company. It was unauthorized officially, but proved itself to be indispensable. This so-called headquarters company contained the personnel of the battalion necessary for fighting and administrative efficiency—that is to say, all who do not actually take part in an action as members of companies. For example, battalion signallers, police, pioneers, cooks and grooms cannot be classified as men whose duty is solely fighting. The inclusion of these specialists, or "employed men" as they were called, on the strength of platoons gave the higher authorities an erroneous impression of what the actual fighting strength of a battalion was. For example, a platoon might contain 18 fighting men under the old conditions and in addition 12 "employed men." Its total strength was therefore 30 men on paper, but it only took 18 into battle and merely encumbered its pay-books with the 12 men who were otherwise employed. The headquarters wing, so called to distinguish it from a fighting company, will be approximately 200 strong, subdivided into four groups for administration. In particular, it is of interest to note that in the headquarters wing will be included, as an integral part of the battalion, the machine-gun platoon (eight heavy machine-guns) and the Stokes light-mortar section (probably two, possibly four mortars). Although these are composed of men whose duty is fighting, it would be incorrect to include them in the platoons, as they neither fight as part of them nor are trained by the platoon commander. It will be observed that the battalion in 1921 was armed with seven different kinds of weapons (not to mention smoke and gas) as compared with two in 1914:—viz. the rifle and bayonet, the rifle grenade, the hand grenade, the Lewis gun, the Vickers gun, the light mortar, the revolver for Lewis gunners. In addition it is likely that it will be necessary also to arm infantry battalions with some form of light gun, primarily for defence against tanks. The question of accompanying artillery is dealt with elsewhere (*see* ARTILLERY). There will then be self-contained battalions which must be skilfully trained in the use of the numerous weapons with which they will be armed. The crux of the infantry problem will be how to train the infantry soldier, equipped as he will be with these complex weapons.

The need for skilled officers and trained non-commissioned

officers is thus greater than ever it was, and the ideal would be to have in each battalion 64 section commanders, each capable of leading and training their sections in the use of the weapons with which they are armed. The 16 platoon commanders and their seconds-in-command will have to be experts in teaching the uses of all platoon weapons and in the tactical handling of the sections in the use of ground. The achievement of this ideal should leave company and battalion commanders free to think out and practise with their units the best methods of coöperating the platoon weapons with the battalion weapons (the machine-gun and the light mortar) and of coördinating these with the other arms (artillery, tanks and aircraft).

Under peace-time conditions this ideal may remain a dream owing to the scarcity of men with whom to carry out any form of training. Also the battalions serving in peace-time at home suffer under the additional burden of completing the elementary training of all recruits, because these are only partially exercised at the regimental depots which they join on enlistment. The civilian is apt to think that a battalion 700 strong has 700 men with which to train itself for war, but in practice it is fortunate if it can muster a single company at a time for training owing to the demands made for drafts and peace duties. Another great hindrance to British training is involved in the fact that the commanders of home battalions are compelled to furnish from their units, and send abroad every year, all the drafts which are required by their linked battalions serving overseas. But, as if these hindrances were insufficient, an even greater difficulty is caused by what are commonly known as "employments." These are of two kinds: (*a*) "employments" carried out by the battalion in peace and war, and (*b*) "employments" carried out by the battalion in peace only. The latter may be servants to staff and departmental officers, gardeners, men employed in regimental institutes, or at brigade, divisional or command headquarters, grooms of officers outside the battalion, etc. These are the type of employments which eat the heart and soul out of every company commander, and which militate against his efficient training for war. Two remedies at least are obvious, but like all transparent truths are slow to be adopted. In the first place the need is for some form of "employment company" to be established in peace, as it had been in the war, to relieve battalions of such servitude. In the second place, the regimental depots might be so reorganized as to turn out recruits fit to take their places in their sections and platoons, and capable of taking part in company training, whether at home or abroad, directly they join any battalion. Without these two indispensable reforms the problem of training the British infantry for a future war is likely to continue unsolved.

Before proceeding to describe what infantry does, it may be useful to emphasize one outstanding difference between British and continental European organizations, namely, the absence from the British service of any regimental personnel. British brigades are composed of four single battalions which lack regimental unity of *moral* and tradition, as well as the habit of working together in peace-time. Nor are the brigades even permanently constituted as are the continental regiments. There are compensating advantages, due to garrisons scattered over an empire with the valuable experience of service overseas. But all the facts do not seem to have been taken into consideration by those who framed peace and war establishments after 1871, or they would surely have compensated battalion commanders for the first line transport and other services which depleted their ranks. Indeed, from whatever angle British battalions are viewed in detail, they appear to exist only on sufferance; and constantly an endeavour becomes visible—to make one man count as two. When this calculation has been successfully achieved it is found that training has invariably been sacrificed. The band however always remains.

*The Rôle of Infantry.*—The question is sometimes, "What is the use of Infantry? Is it not butchery to expose men on foot to the mechanical horrors of the battle-field of to-day?" A soothsayer occasionally declares: "There is no place left in battle for a man as a fighting entity—his rôle is that of a machine tender." But man, on foot, is still more universally mobile than any machine. In his agility still rests the key to unlock the fastnesses—which no machine yet invented can enter—wherein his fellow man can hide himself. The more destructive weapons become the more does man seek impregnable shelter in which he can escape the missiles of death-dealing machines. But where man has entered, there also man can follow to seek him out, and until the assailant possesses a mechanical octopus he must himself go in to dislodge his adversary. The appliances manufactured by inventive genius only help to break down the barriers to this final act of combat. Man in war cannot be beaten until he owns himself beaten. Experience of all war proves this truth. So long as war persists as an instrument of policy the objects of that policy cannot be attained until the opponent admits defeat. Total extermination, even if it were possible, would recoil on the victor in the close-knit organization of the world's society, and might involve his own moral and commercial ruin. Moreover it is unnecessary. In all war, man, immediately he realizes that his opponent is permanently superior, and directly he has no further hope of victory, yields. To this history bears witness.

Therefore victory produces a moral rather than a material result. To conquer one has to make the enemy feel the force of a superiority which shakes his faith in his own power to win. This demoralization is achieved by a concrete manifestation. Military history testifies that the infliction of casualties does not produce it as a certainty. The survivor alone retains the power to admit defeat, and must therefore be made to feel the superiority of his opponent. The concrete proof of this to him lies in being driven back—not a few yards only, for his *moral* will survive that—but in being hurled back in confusion. The demoralization which begets a conviction of inferiority also comes from the break-up of organization. When the parts do not function hope vanishes.

Now, the greater the progress in weapons, the more far-reaching is their range of destruction. But this greater range brings with it its own counterpoise. The man on the battle-field feels that it is no use to run. Speed of foot will not outstrip the velocity of the projectile, and, as there is little hope of safety in flight, he stands his ground in desperation and seeks to hide from the missiles. He becomes fatalistic, resigned to death. Terror of the machine has overstepped its aim. In such mental state man is no longer guided by his instinct of self-preservation. Temporarily he is akin to an animal confronted by some inhuman threat which it does not understand. It remains motionless, petrified, awaiting its doom, until it perceives some living agency behind the threat. Then only are its senses restored and its instinct of self-preservation revived. It flees. So with men on the battle-field. The sense of defeat, of inferiority, can only be achieved by an agency which is tangible and human. Man needs something from which to run—some tangible oncoming danger from which escape is possible. The hostile infantry supplies it in human form. Even in panics, when no real enemy is present, the images created by hallucination are those of human pursuers.

It is the infantry, and the infantry alone, which can bring about retreat or surrender in the open field and so place the coping stone—victory—on the edifice of battle. A great artillery bombardment will drive the enemy to ground, but even where great concentration of shell-fire is achieved, it cannot dislodge him. He is safer in his dug-out than in flight. The tank is tangible, it is true, and therefore less petrifying, but man can avoid it or hide from it more easily than from infantry. Moreover it is less agile, more cumbersome, more limited in its modes of action than the foot-soldier. There are types of obstacles which it cannot yet surmount, ground which will not bear its weight, or which is too rough or steep to cross. Cavalry, like infantry, is a human arm, but it affords too easy a target, is too quickly stopped by rifle or machine-gun fire, and is less mobile on rugged and broken ground. Its superior speed is insufficient compensation for these drawbacks except against broken and flying infantry. Thus we see that infantry is the sole decisive arm in battle, that its power is based on human rather than on material factors, and that its tactics spring from moral elements of which the chief is fear.

If therefore we wish to understand the action of infantry we

must analyse and understand *fear*, in order that we may exploit it in our enemy and remedy it in our own infantry. The exceptional man may not feel fear, but the majority of men do. Their nervous self-control alone stands between them and yielding to fear. How to cause this collapse of our enemy's nervous control and strengthen that of our own men offers a wide field of investigation to future trainers of all arms, but especially of infantry. This nervous control by which the weakness of human flesh is subdued may be upset in two principal ways. It may be worn thin by continued strain or it may be shattered in a single instant by a shock. Usually it gives way under a combination of these two influences. The nerve control can be worn away imperceptibly by the anxiety, the suspense of waiting for an enemy's blow, or by the noise and effect of shell-fire, or by the loss of sleep which renovates the tired will. Then, without warning, the shock of a surprise snaps the fine-drawn thread of our will to resist. Stubborn resistance may then change in a moment to panic flight, and its frequency will depend on inherited racial temperament.

*Destruction of the Enemy's Moral.*—To wear down the enemy's nerve control is the rôle of the commander, of the artillery, of bombing aeroplanes. When opposing armies are in close contact the infantry shares in the process by raids and false attacks. In the battle, the part of the infantry is to snap, not wear down, the enemy's control over his fear. The fracture is effected by the enemy's sudden realization that he is powerless to ward off his assailant's blow. To accomplish this we must pass a sufficient, though not necessarily a larger, proportion of men through the curtain of his fire, to a point so close to him that they can assault, or offer the threat of an assault which he realizes he is powerless to prevent. The key to this assault is fire at short range, to pave a way for the onslaught. Hence formations which avoid loss by taking advantage of cover and conserve the will to close with the enemy are necessary. Surprise, the simpler, more certain and less costly method, is effected by assault from an unexpected direction against an unguarded spot at an unexpected moment. The key to infantry success is therefore movement, or, in military language, manœuvre. Fear, above all, is caused by uncertainty and apprehension of the unknown, which breaks down the will to resist and gives to the assault in flank or rear its supreme value. Thus at close quarters mere numbers are not the deciding factor, and assaults are better launched by platoons than by battalions.

*Strengthening of our own Moral.*—What are the factors which enable the average man to fight down fear? First, undoubtedly, comes confidence—confidence in his superiority to the enemy, based on his own skill in handling his weapons; faith in his leader's skill and judgment, combined with devotion to him as a man; trust in and comradeship with his fellows—the assurance that he will be backed up, that his efforts will not be in vain. Secondly, *esprit de corps*—which is allied to confidence. Thirdly, discipline—the power of association to overrule instinct. Lastly, action to minimize reflection on the dangers to be faced.

If a man is engaged upon some definite act or task, his mind is occupied. Hence the advantage of attack over defence. Movement helps to drown fear. So in the attack the moral factor indicates that we should not check the rate of advance in order to obtain uniformity or well-dressed lines. Every time a man stops he offers an opportunity for fear to assert itself. Let him push on to close with the enemy as quickly as he is able, stopping only to regain breath. As soon as he sees an enemy at close range, let him open fire. Not before. Under modern conditions of armament, with the overhead fire of machine-guns and artillery superposed on the fire of the defenders of trenches, attacking infantry has a harder task than in Frederick the Great's day. To demand of it, therefore, a slow advance in line is to strain the nerves unduly. It indicates the presence of leaders whose teachings are based on mechanics, not human nature. Thus movement is the safety valve of fear. We should force the pace of the attack, for the sooner the man closes with his enemy the less chance he has to be apprehensive of what awaits him. But we cannot force the pace if we stop to fire at long ranges. Discipline no longer implies an unthinking obedience. The discipline which dominated fear by inspiring a greater and nearer terror is not advisable now that fire units are widely scattered in battle. Even if still attainable it would not be effective under conditions wherein men must disperse if they are to survive and victory depends on the skill and initiative of subordinate leaders. The mechanical discipline of the past is an anachronism in battle. The need is for intelligent discipline—a discipline compared by the late Col. G. F. R. Henderson to that of "a pack of well-trained hounds, running in no order, but without a straggler, each making good use of its instinct and following the same object with the same relentless perseverance." Infantry discipline should be based on that pride and self-esteem which comes from *esprit de corps*. Man does not dare to show himself a coward under the eyes of the leader he knows, the comrades with whom he shares his duty and recreation. This discipline is based on the confidence that unity gives strength.

Confidence is born of training—the training of each individual, the training of the leader, the training of the unit. These successive trainings forge the infantry weapon and make it fit to act its decisive part on the battle-field. Moreover these various trainings of human beings symbolize the truth that man is still the master of the machine. But no greater error is current to-day than that infantry is the most easily trained arm. None needs more care, more skill, if it is adequately to play its part. For it is the least mechanical and by far the most human arm in existence. Yet experience of the World War indicates that of all the arms and services, infantry, the backbone, was the least trained. This defect was due not so much to the reason that less care, less research and thought were devoted to it—though these factors counted—but to the reason that it is the most difficult arm to train, because it possesses so few concrete elements. It is concerned with tactics and ground, not with material and stable equations. To train infantry is to exercise an art, whereas to train gunners is to apply a science; the one requires an artist, the other a calculator. The man in the ranks of the artillery, the tank corps, the air service, is often a mechanic—executing a concrete task in a definite manner. Initiative is the province of the officer, but even he, in the subordinate ranks of other arms, is concerned with producing a material effect. The infantryman's use of material—his weapons—is only a means to an end not an end in itself. He himself survives the scientific developments of countless wars because his human value remains unchanged. Even in the employment of his weapons he is guided by variable factors and conditions. But the use of his variety of weapons is only complementary to the use he makes of tactics and ground before he gets to grips with his enemy. The variety of elements with which he has to deal has led as a rule to each different unit being trained—too often mistrained—according to the whims and prejudices of its temporary commander, who is apt to confine himself to such parts of the subject as he himself knows best. Hence a tendency towards over-emphasis of such matters as drill, musketry, bayonet fighting, which can be easily mastered by the intellect of the average officer. Hence also the neglect of tactical training, which demands thought and is difficult to learn and teach because it deals with moral and variable factors and requires a modicum of imagination.

*Minor Tactics and Fire Tactics.*—Right tactics are above all the source of the man's conviction of superiority. The tactics of infantry must be based on human nature and not on mechanics or geometrical perfection. Yet it is almost incredible how in the past the complex of showy evolutions deduced from the parade-ground have persisted on the battle-field. It is a truism to say that a revolution has been wrought in infantry tactics by the inventions which mechanical science has brought to bear on war. But it is no less true that the consequences of this revolution take years to understand. This lesson may be summarized in the phrase—"the power of manœuvre." It needs a complete reorientation of military thought and fresh views before we begin to extract right methods from the melting pot of war. Yet that infantry which soonest learns its lesson will be supreme.

A mastery of elementary tactics is essential if infantry is to attain its goal in battle and justify its claim to be the decisive arm. It must be permeated by the best doctrine which the last war can

teach, and its junior commanders must no longer be subjected to the whims or prejudices of whoever happens to be in temporary command. Moreover the doctrine should be adopted by authority, and be expressed in language so simple and by metaphors and illustrations so clear, that it can be as readily grasped by subalterns and corporals as by general officers. Its manual of instructions should be as intelligible to the Australian bushman as it is to the staff college graduate.

In 1806–15 the British were capable of a sustained effort in the theory of tactics as originated by Sir John Moore, and there is reason to believe that British infantry could to-day be trained to as high a pitch of comparative excellence—but not without a definite doctrine of minor tactics and some evidence of leadership to inspire its wholesale adoption. This quality of leadership in peace-time needs the special ingredients of spirit, intelligence and human sympathy together with sufficient character and determination to carry conviction to the mass. Just as Sir John French inspired a new doctrine of peace training at Aldershot after the S. African War, so now could a leader develop the experiences of the last war and reduce fire tactics to simple exercises for platoon and company commanders. Such a doctrine would probably be based on the little group of six men following a corporal whom it knows because he has trained it. In the hurly-burly of modern war, these little groups retain cohesion because men will follow a leader whom they see close to them, whose voice they can hear and whose presence is familiar. These groups (named sections), trained by higher leaders whom they trust, will forget themselves and accept any risks in battle if they are convinced by habit that their effort will not be in vain, that their successes will be immediately supported. A fire unit which forms part of a trained team will sink itself unhesitatingly if it knows that the rest of the team will not leave it in the lurch or allow it to bear the brunt alone: that, when it has spent itself to make an opening, others will relieve it of the burden.

Therefore infantry should be distributed in depth, not in lines. Every man should be able to see near at hand *behind* him a body of troops ready to back up his movements. Better still, let this body be trained to support him by diverting the enemy's fire to another direction. A mere reënforcement may fail to inspire him with an access of confidence, for it is probable that some infection of discouragement might communicate itself to those who merely add to his numbers in a hot corner.

For decades the infantries of all countries attempted to produce tactics adequate to the new weapons at their disposal by multiplying the lines which were so successfully used by their forerunners in the days of the musket—with its short range and slow rate of fire—and the case shot and solid shot of the artillery. They moved shoulder to shoulder with intervals. The idea of manœuvre was absent. Even down to the closing stages of the World War the action of infantry units in battle—as distinct from a skirmish or an affair of outposts—was confined to frontal attacks. Manœuvre was the weapon of the higher commanders only. A division or a brigade moved as a body; hence it was its commander alone who had the power of striking an enemy force at two or more different angles concurrently. We have already seen how slowly the idea of decentralized fire orders developed. It was the same with decentralized power of manœuvre.

When in the middle of the 18th century armies began to be distributed in separated columns, the lead of the French under De Broglie brought about a revolution in strategy and tactics. The limbs of the army—its columns—moved independently though animated by a common plan. Intervals sufficient to be penetrated were left between them; and therefore their commanders gained facilities for manœuvre. But since the middle of the 17th century the smaller infantry units had continued to move and fight in bodies presenting a continuous front. Indeed down even to the last stages of the war of 1914–8 the rule of a continuous front held good. Exceptions occurred in frontier skirmishes, or on account of accidental or enforced disorder inside a [illegible]'s position. One corps of an army might attack an [illegible] front while another might turn his flank, but for the infant[illegible] of each corps attack, as likewise in defence, the manœuvre was usually frontal. In any large action each of the infantry units was necessarily allotted only a fraction of the frontage of the force of which it formed a part. This narrow sector was at first hedged in on either side by neighbouring units of a corresponding size. How then was it possible for attack or defence on the part of infantry units to be aught but straight to their front? How can they possibly manœuvre if they have no space to move in? And how can they be expected to move to a flank if they possess no intervals and no flanks? But at last a change became imperative, through losses due to the range and deadliness of missile weapons. These have enforced a wide dispersion of small combatant units on the battlefield and intervals between adjoining units. These intervals are usually 100 yd. between each leading section. The lesson was stubbornly resisted until the toll of loss could no longer be burked by authority. Similarly in each succeeding war after the middle of the 19th century such lessons were emphatically impressed on the imagination of nations, and towards the end of each war wider intervals between the men were accepted. Thus extended order—in which bodies of infantry moved to the attack deployed in successive waves or lines, with intervals of several yards between each man and his neighbours—was the outcome of the S. African War of 1899–1902. But, as the years of peace rolled on and recollection of the effects of fire faded, the pendulum swung back and the intervals between men were reduced. More especially was this so on the continent of Europe, where tacticians clung to Napoleon's tactics rather than attempt the more difficult task of adapting the spirit of his principles to conditions imposed by accurate firearms.

*The Continuous Line.*—Thus it came to pass that, in spite of the fire effect produced by scattered Boers sitting on distant *kopjes* in S. Africa (1899), and in spite of Japanese losses in assaults at Port Arthur and elsewhere in Manchuria (1904), European tacticians failed to shake off certain notions about continuous lines and storming masses. They fully appreciated the importance of putting what they called "weight" into the decisive attack, but failed to realize that the weight or forcefulness of an attack no longer increases in proportion to the number of infantrymen thrown into it. In S. Africa wide and premature extensions were adopted to minimize losses on the flat veldt, but such extensions did not lead to any idea of manœuvre. On the contrary, the unmanageable thin lines, one behind the other, were incapable of any intelligent manœuvre—as was discovered in peace training after the S. African War. But even then the idea of a manœuvre to a flank by a small body was not grasped, or at any rate it was not taught as a definite doctrine. Skirmishing lines in extended order made rushes and utilized ground; they fired in small bodies and opened at long ranges; at the decisive points they were gradually thickened up into a crowd. These crowds surged forward at a given signal and assaulted to their front. But the infantry soldier was so near his neighbour in these sham battles that he had scarcely sufficient space to load and fire his rifle without hitting one of his friends; the units became so mixed together in the process of thickening up that neither the corporal nor the subaltern could exercise control over his own men or any unit; often he could not find them during the decisive stage of the battle. Fortunately the "cease fire" soon sounded and reorganization took place; but in 1914–8 there was no cease fire and no umpires, and the warring infantries were slow to learn. This was no doubt inevitable, and is a sufficient reason to try to gather now the best experiences from 1918.

Moreover, it was not realized so clearly as it might have been that it enhances the *moral* of the defenders to see waves of the enemy crumpling up under the fire of the new weapons which invention has introduced. The greater the visible effect of fire on the attacking infantry the firmer grows the defender's faith in himself, whilst a conviction of the impregnability of the defence is intensified in the mind of the attacker. Close ranks do not even make for greater fire effect. The moral influence of fire is produced by that which has physical effect, and the experience of 1914 demonstrated that cool, deliberate shooting by individuals produced this material effect. Volleys from dense waves—

infected by the contagion of excitement—are so ineffectual that they heighten the defenders' *moral*, particularly when he sees his own machine-guns being more accurately employed.

The British army suffered less than others from reactions towards greater density of formations, because on the one hand it thought in terms of limited numbers whilst on the other it was constantly engaged in small wars and expeditions. Its members had less occasion for the effects of fire to fade from their memories. Nevertheless even in the British army during intervals of peace denser formations were adopted. The national bane was that of lines themselves, rather than of dense ones in particular. It was hardly till the middle of the World War that it was realized how slow of movement were the dense waves. Lines require long pauses to restore their dressing unless they are to dissolve in disorder. Moreover, every infantry unit was trained to wait for its neighbour and avoid an exposed flank! Consequently the pace of the line became the pace of its slowest unit. The rolling barrage was often lost merely because one unit detained all the rest. But at last, instead of lines, platoons were utilized in depth, each part under the thumb of its own leader. Some control was thus retained, some cover turned to account and the section pressed forward without waiting to keep pace with others. Above all, it outflanked. It is to human nature, however, that the chief credit for introducing this power of manœuvre should be ascribed. The effects of fire enforced dispersion and wide intervals between men, but it was poor human nature, feeling lonely and leaderless as a single peg in a long row, which instinctively sought companions and a leader and grouped itself with comrades under the nearest N.C.O. This it has always done, because it is human nature so to do—whenever the unnatural mechanism of ranked lines breaks down under aimed fire.

The value of personal example which subdues fear is applicable only to a handful of men who feel the direct influence of a leader. They sense that they are under his eye and known to him personally, and that any wavering will be remembered against them. Thus the group, if it is to have value, must be limited to some half-dozen men. In the turmoil of modern war small groups, not big ones, will keep together. Then each man yields to the leader's power of sweeping him on. Moreover each little group needs to form part of a team, to feel itself supported on its flanks and behind by similar groups acting in unison. Hence the importance of the platoon—the tactical unit of battle to-day. For in battle men need some rock to which to hold fast—the artilleryman has his gun, the aviator his aeroplane, infantry its platoon commander.

Human nature conquered the line formation before its breaking up was officially sanctioned. Tradition held fast to her pre-war habit, but the need for a control which could not be obtained with the extended line helped to breach the ramparts of orthodoxy. The group attained its final and complete recognition after its success against the German "pill-box" defence, in the dreary wastes of the Ypres salient in the autumn of 1917. Also the Germans in their 1918 offensive deliberately trained their infantry in similar groups with orders to penetrate everywhere by infiltration. British dispersion, enforced by new weapons and human nature, rendered penetration possible by attacking infantry groups—termed "sections" in the British army—between the posts or machine-gun "nests" of the defenders. By exploiting every initial penetration by sections and platoons, the commander on the spot attacked in front and flank simultaneously such posts of the enemy as opposed him in his own sector. This newly acquired power of manœuvre restored to infantry the master-key of victory, and retains for it still the rôle of "Queen of Battles" which the old stereotyped tactics were rapidly losing.

Infantry action in battle no longer resembles a wasteful bludgeon-fight or an incursion of the camp followers of other arms. It engages in a test of skill, a manœuvre combat in which is fulfilled the principle of surprise by striking from an unexpected direction against an unguarded spot—namely, the flank exposed by infiltration into the crevices of the defensive position. Its training should therefore be correspondingly perfected, on the basis of a doctrine of fire tactics founded upon penetration and manœuvre as exemplified in 1918.

*The Principles of Manœuvre.*—The outstanding lesson gained from the new-won possession of infantry units—the power of manœuvre—is that correct tactics can now be based on the fundamental principles which govern the action of other independent bodies which manœuvre. The platoon is no longer fixed in a segment of the machine of battle, but is an independent moving part fighting its own small action. The principles upon which it fights may be compared to those which actuate a single individual engaged in a free fight with another man. As a personal combat is understood by all, whereas war is intelligible only to a few, let us for a moment examine the simplest form of fighting, promising that, owing to the concealment of the enemy and the "fog of war," the fight which typifies the infantry fire-fight is that between two men in the dark, wherein a man can only locate his enemy and find his way to his vital spot by actually touching and feeling him. In the first place a man in the dark must seek his enemy. To do this he will stretch out one arm to grope for him, keeping it supple and ready to guard himself from surprise. This may be termed the principle of the "protective formation." When his outstretched arm touches his enemy, he would rapidly feel his way to a vulnerable spot such as the latter's throat. This is the principle of "reconnaissance." The man would then seize his enemy firmly by the throat, holding him at arm's length so that the latter could neither strike back effectively nor wriggle away to avoid or parry a blow. This is the principle of "fixing." Then while his enemy's attention is absorbed by the menacing hand at his throat, with his other fist the man strikes his opponent from an unexpected direction in an unguarded spot, delivering out of the dark a knock-out blow. This illustrates the principle of "decisive manœuvre." Before his enemy can recover, the man follows up his advantage by rendering him powerless. This is the principle of immediate "exploitation" of success. To adopt for fire tactics these simple principles may prove a sure guide to local victory.

*Protective Formation.*—Owing to the dispersion and concealment necessitated by the deadliness of modern weapons, attacking infantry can only locate the enemy posts immediately in their path by actual attack—touching and feeling them as did the man in the dark. Like him therefore, the infantry unit moves during the "approach march" and attacks with a portion—the outstretched arm—pushed ahead in the direction of the enemy. This portion is usually termed the advanced guard or forward body. The remainder of the unit, termed the main body or support, follows close behind, ready to manœuvre, and by its mere presence protecting the flanks of the forward body. Hence if we speak of it as the "manœuvre body" its functions explain themselves. To diminish the possibilities of surprise and loss from hostile fire, the platoon or company moves in a formation resembling a diamond or square, of which its sections form the points. The fire or fighting sections no longer move in an extended line. Instead each advances in the form of an arrowhead or in open file or single file with the section commander at the head, so that he may control and lead amid the noise and confusion of battle. To do this correctly he must be trained in peace-time or he will lose his platoon.

*Reconnaissance.*—Reconnaissance is carried out by moving with scouts ahead, but within touch, in order, like the man in the dark, to touch and feel the enemy. It is their rôle to discover the best approach, to give timely warning of the enemy's nearness and to prevent the unit coming under surprise fire. All this may be done even in a set-piece attack behind a rolling barrage.

*Fixing.*—The forward infantry press on unceasingly in order to find and penetrate any weak spots in his defence and to advance to the objectives assigned to them. If the forward body of a platoon is checked by an enemy post, it fixes it firmly by fire so that the enemy's attention is absorbed "by a menacing hand at his throat" whilst the manœuvre body works round his flank to deliver a surprise blow. This act of fixing can best be achieved by a combination of fire with movement. There must be the threat of the forward spring in order to fix the enemy's attention. Fire alone, from the hastily chosen halting places of an attacker, cannot be relied on to absorb the whole attention of a defender

behind carefully selected cover. Unless each forward infantry section is imbued with a determination to press forward, the posts of the defence may be able to bring cross-fire on groups which have penetrated the position. But there is still a further means by which the enemy can be fixed. The last war has added a useful weapon to the infantry armament—smoke. This new element gives the user the conditions of day but imposes on his adversary the conditions of night. Mist or fog has often been a decisive but accidental factor in battle, but with the introduction of artificial fog which can be projected at the will of the user, the enemy's view is impeded whilst his own movements take place in daylight. In attack, the forward sections may fix the enemy posts more effectively by firing smoke to windward of them, than by rifles or Lewis guns. Thus smoke helps small local assaults.

*Decisive Manœuvre.*—The manœuvre body of an infantry company follows close behind its forward platoons and remains under the hand of the captain. If and when the whole of a forward platoon is held up by the fire of an enemy centre of resistance, the captain uses his manœuvre body to turn a flank. To achieve this he might have to quit his allotted sector and follow in the wake of a more successful unit on his flank. Passing through the gap he turns and assaults an exposed flank of the centre of resistance. Such a blow has the moral effect—coming as a surprise and threatening the line of retreat—which is the key to victory. But if the defenders of the post turn to meet this flanking attack, the forward body should rush in and assault them from the front. Such combinations are simple if peace training is staged on the basic principle of "fixing and manœuvre" as the key formula of fire tactics. This combination of fixing and manœuvre is the bed-rock principle of every street fight. Watch a couple of small boys tackling a bigger one. What happens? One of the small boys rushes straight at the big boy, and when his attention is fixed the other runs in from behind and delivers a blow. The first small boy puts all his energy into this effort, for he knows instinctively that if he fails the opponent will beat them each separately. But if the big boy attacks one of the small ones, the other in like manner rushes in from behind. Thus "fixing" and "decisive manœuvre" should become a formula engraved on the mind of every infantry corporal and subaltern, and he should also be trained to act upon it instinctively. It has won general acceptance since the end of the war, and concerns above all the tactics of the platoon, which is the smallest unit which can fix and manœuvre without waiting for orders from a superior. Hence the paramount importance of training platoon commanders to act without hesitation when leading an attack. Hence also the desirability of rewriting the training manuals with some regard for the principles which govern every fight and of discarding fire tactics invented only for parade purposes. Fortunately, there is reason to believe that the post-war training manual of the British infantry will fulfil this condition.

*Exploitation.*—The principle of exploitation is fulfilled by maintaining an unrelenting pressure on the enemy until his retreat spreads and gains in momentum. This is done by fresh units coming on behind the original front.

*Defence.*—From our glance at the street fight between the three urchins we realized that defence resembled the attack halted. Any infantry unit is capable on account of its open formation of offering immediate resistance to hostile attack or counter-attack. It only remains for it to consolidate the ground on which it has halted, so as to gain the most cover and the best field of fire. The adjustment and entrenchment of its posts to this end depend on the time available for surveying the ground, digging in, and erecting entanglements. The battle principles which have been discussed as regards the attack are also applicable to the defence. Its protective formation is similar to that for the attack. The posts of the defence are distributed in depth and so disposed that they mutually support each other by fire. Reconnaissance in defence is carried out by patrols who watch approaches, or if in contact with the enemy go out at night or in foggy weather to discover his dispositions and movements. In defence, fixing is carried out by the fire of the forward bodies from their prepared sited posts. Their rôle is to break up the enemy's organized attack. If the attacker makes a gap or effects a lodgment into the position of any forward bodies, the manœuvre bodies counter-attack to throw him out. Should the attack break through the forward positions on a broad front, the manœuvre bodies take him in flank by fire. Just as manœuvre is superior to frontal attacks, so is defence-fire which enfilades from a flank the more damaging to the attackers' *moral*. In this as in all cases the training and determination of the better infantry wins the day, but the great advantage possessed by the defence—almost its only advantage—is that its action can be thought out beforehand. Its manœuvre bodies can be placed on a flank in readiness for action, and can be practised on the actual ground to counter-attack from favourable positions with auxiliary arms to help them.

*Picture of an Infantry Battle.*—Who is there with experience of big attacks embracing miles of country in France, that has not seen the most resolute infantry suddenly assailed by a burst of surprise-fire from the flank or rear? Its self-forgetting determination grows uncertain; it ceases to move and looks furtively for cover. If the surprise-fire continues from invisible shooters, the men become irresolute and nervous. The will to advance is gone. If the threat of a counter-assault from a flank should immediately follow they look to their rear and break or dribble away. Unless their own commander coming on from behind can throw in an opportune reserve to counter the counter-attack and restore the local situation, the attack is stopped. That is how, so often in France, one German machine-gun nest—just one little group inspired by the will to resist, nourished in the principle of surprise—would hold up the attack of a company and sometimes of a whole battalion. It is thus we learn to visualize the infantry unit—battalion, company or platoon—in the battle of to-day. It possesses the power of offensive movement and yet is protected by its open formations. Its articulation into interdependent moving bodies, capable of manœuvre, is the main infantry feature developed by the World War. The illimitable extension of fronts, brought about by the vast numbers which nations in arms put into the field, forced the military leaders to seek and discover a solution to the deadlock—and they found it at last by the gift of the power of manœuvre to infantry units down to the platoon. By 1918 we had travelled far from the fire tactics of King Edward at the battle of Crécy (1346), where he was posted on top of a windmill and was practically the fire-unit commander of his army. This revolutionary idea began to emerge in the Flanders attacks of 1917, but was still only in its chrysalis stage when the war terminated in 1918. It still lacks a clear, simple working formula which can be understood by lance-corporals and practised in their daily exercises.

Let us for a moment try to picture the infantry fight of to-day in a European campaign between nations in arms, the description being invented merely to emphasize the salient points.

A battalion is advancing towards the fighting front, which is gradually receding eastwards. It is a hot summer morning. The division attacked soon after dawn, and the advance has been going well. To the trained ears of those in command posts behind the front its success is audible because the noises of battle are rolling ever farther away. The shell-fire dies down spasmodically—part of the guns are being pushed forward to back up the infantry progress—then flares up again and swells the volume of sound. The eye also notes that the line of observant kite balloons on the enemy's side is moving back—occasionally one collapses in flames, destroyed by the intrepid pilot of an aeroplane, or is hastily hauled down to avoid destruction. Our own kite balloons are moving forward behind our advance.

The brigade of which the battalion forms part is in support, and is moving up to "leapfrog" through one of the leading brigades and carry the advance a further stage. The battalion we are watching is one of the forward battalions of this brigade, and is still in column of fours on a road. Already long-range shells are bursting near and on the road ahead. To avoid loss, the battalion opens out first into company columns, resembling an open square; then as the shells grow more frequent into platoon columns off the road. Suddenly a flight of enemy bombing aero-

planes are seen like rapidly approaching specks in the distance. Each platoon promptly deploys into little section groups, moving on under control, and yet so scattered and irregular and offering so small a target that the bombs bury themselves harmlessly in the ground. Futile cascades of earth and stones fly in all directions. Other low-flying aeroplanes follow up the bombing attack by diving at the infantry and firing sharp bursts of bullets from machine-guns. The scattered groups crouch and open fire—the aeroplanes disperse—all save one which, caught by a burst of Lewis gun-fire, crumples up, and with the unforgettable thud that only a crashed aeroplane begets, strikes the ground in a tattered moil of canvas, steel and wood. The infantry move on, their apprehensions of the coming battle lulled by the excitement of the moment—their *moral* heightened by their lack of casualties and the summary retribution which has overtaken one assailant. The rapid unmistakable chatter of machine-gun fire is heard over the rise beyond; the drifting patches of smoke from bursting shells which cover the position gained by the infantry ahead are warnings of the imminence of the call to play an active part in the battle. The deployed battalion is halted under cover of a rise, whilst its leaders survey the ground ahead, and the orders are issued—two companies will lead the advance, a third will follow in support for manœuvre and the fourth company will be retained as a reserve under the hand of the battalion commander. He tells the captains that, as far as is known, the enemy has not had time to organize his back defences and is holding improvised positions which the air service has not been able to locate definitely. He points out a low ridge 2,000 yd. ahead, and informs them that the battalion's rôle is to seize and hold this ridge and consolidate a position on its further slope.

The frontage allotted to the battalion is about 1,200 yd. as marked on the map at the start, and an equal sector of the distant ridge is to be consolidated. There will be no rolling barrage from our artillery—it would only hamper movement—but forward guns will engage centres of enemy resistance. A section of tanks will coöperate with the battalion, and the protective barrage now assisting the brigade in front will lift at 8 A.M. Then advance begins, and the battalion, deployed with 600 yd. of frontage allotted to each leading company, passes through the forward troops—busy as ants digging in and strengthening the position they have gained. Once clear, the section groups shake out into little arrowheads or worms which push forward at a quick walking pace over broken ground; 100 to 200 yd. separates each front-line section. The shell-fire is heavy, but, thanks to the scattered and irregular formations, losses are slight. The air is clamorous with noise, the senses are afflicted by the sight and vibration of bursting shells, but the sections of six men each (sometimes flinging themselves down as a shell bursts over close, then leaping up and pressing on) are too wide apart, too well able to take advantage of cover, too closely knit by the kinship of the section with the corporal whom they follow, to feel the strain. They are too busy moving over broken ground to think of anything but to keep together and go straight to their objectives. The forward companies at last come under heavy machine-gun and rifle fire from the enemy's new position, a system of posts sited to cover each other by fire.

The little groups then worm their way forward, making short rushes from cover to cover, crawling even when the fire is hot and ground too open, but always working nearer. At one or two points groups find covered approaches, perhaps a ditch, a hollow, the bed of a rivulet, by which they penetrate between the enemy's posts. The platoon commander moves with his manœuvre sections to back them up—then when the post is fixed by fire or blinded by smoke its flank is rounded and the defenders turn too late. Drab-clad forms rush in upon them from behind and hands are put up. That moral force which rules battles makes the actual shock a myth, and the nerve-stricken defender, overcome by the powerful moral weapon, surprise—not outfought but out-manœuvred—surrenders or is bayonetted. In other instances the forward sections lose heavily or lack the vital will to close with the enemy; the section leader is unduly cautious; he hopes and waits for his neighbour to find a soft spot, and thus the enemy confronting him are able to keep watch on their flanks and greet the outflanking section with a hail which crumples it up. A tank comes to the rescue, but there is much delay before the post is conquered. Yet in some places quickly, in others tardily, some sections and platoons push deeply into the vitals of the enemy's position. The company commander presses on in the wake of his more successful platoon, and pushes forward his manœuvre platoon diagonally into any soft spot found on his wide front. Thus a success is immediately exploited. The sections are always pushing forward, seizing the fleeting chances given by a shell bursting near an enemy post to rush closer, by smoke to push round a flank, by the fire of a neighbouring section to dash to the next scrap of cover—ever onward because they know that speed of advance is the way to victory and safety. Every man's agility must therefore be unencumbered by articles of kit, and must be stimulated by two thoughts: one is that the turn of his own company to be the leading and therefore the most combative unit only occurs once during eight battles engaged in by his brigade, and therefore every man is " all out " for the company; the second is that no less than ten companies of his own brigade are coming along behind and will not leave him in the lurch.

No dense targets are here, no close-packed uncontrollable waves—each forward group under its own leader, fighting its way to the goal, following an irregular course dictated by the cover to be found, helping its neighbour by fire and smoke, inspired by a common impulse: its guiding star the knowledge that it can and must push straight for the objective. The company and higher commanders retain control of the fight by the use they make of their manœuvre bodies. The accompanying tanks may be hit or delayed by obstacles, but the infantry, by the use in combination of its own weapons and its power to manœuvre, can still fight its way forward. The help of the other arms—artillery, tanks or aircraft—is treated as providing opportunities to be seized, not to be waited for and counted upon to clear the ground of enemies.

Here a company is held up by a counter-attack and the situation looks serious; some men waver; their section leaders are down. But the understudies take charge; their little groups, now shrunk to half their strength but still effective fighters, lie down and open fire. The counter-attack pauses; a diversion comes; the battalion commander, who has followed in the wake of the other forward company, turns inward through the gap, throws in his manœuvre company or a portion of it against the flank of the counter-attack. Surprise again. The enemy, caught by fire from two directions, faced with the threat of assault, waver and break. Their demoralization is infectious. Posts which had held out stubbornly give way; the tide of defeat sets in; everywhere enemies are seen trickling backwards. Pressing close on their heels the whole battalion makes its way towards another position of resistance. Here it beats vainly at first against the dam of the defence, seeking a crack through which it may infiltrate; it succeeds, at first by driblets and then in increasing volume, till suddenly the whole dam is swept away. This means victory, exhilarating victory. The reserve company, the last, is put in, if it has not been previously employed. Some posts and machine-gun nests have still to be overthrown, but the goal is reached; the ridge is gained and the battalion halts on its further slope. The groups are dispersed over the ground; they begin digging in whilst the artillery put down a protective barrage ahead, until still another brigade passes through our weary but triumphant infantry to carry the advance farther. The battalion continues consolidating the ground won, ready to cover the battalion which has passed through, should it be driven back by a counter-stroke.

Such is a rapid sketch, designed merely to illustrate salient points in the tactics taught in 1918 in France.

*Future Development.*—A question naturally arises as to the probable direction which the development of infantry will take under conditions caused by new inventions, particularly mechanical ones. In what way must we improve and reform our infantry methods in order to lighten the infantryman's burden in view of the probability that he may have to wear a gas mask in every

future attack? The question may be considered under two heads: firstly, means to increase mobility; secondly, tactical doctrine.

*Mobility.*—Almost every mechanical advance means a step towards greater mobility. Every arm and branch of the service is becoming more mobile—or else decaying—under the influence of the petrol era. In the transport of an army the horse has already given way to the road motor, and this in turn promises to yield to a cross-country tractor with caterpillar tracks. The heavy artillery is already motor-drawn, and the lighter field artillery will probably follow suit before many years have passed. A further possibility is that the latter may disappear altogether, and the field-gun be either accommodated permanently in an armoured tank, or carried in one in such a way that it can be quickly mounted on the ground. Mobility is the foundation stone of the value of infantry. Its unique position has always rested upon the fact that it is more *universally* mobile than other arms. But on the normal field of battle, if it is to maintain its unrivalled position as the "handyman" of war, its mobility must keep pace in proportion with that of the other arms. To give it increased mobility two problems must be solved. Firstly, means must be devised for bringing infantry to the scene of its action more quickly and with less fatigue than by the use of its legs. Napoleon declared that he won his victories by his soldiers' legs: that is, by their marching powers, endurance and mobility. This was true so long as the foot-soldier's only competitor was the horse, but the manœuvring power of armies now rests on the speed of railways and petrol engines. In the second place, infantry equipment must be lightened. The soldier must not again be treated as a beast of burden—other means than piling loads on the soldier's back must be devised.

*Transportation.*—Whilst it is no longer true to say with Napoleon that "marches are war," because of the development of mechanical transport, yet truer than ever is the completion of his sentence that "aptitude for war is aptitude for movement." This problem has been approached in the past by the introduction of mounted riflemen and cyclists. The former were handicapped by the necessity of leaving a considerable proportion of their strength to look after the horses. Cyclists suffered from the defect of being tied to the roads and the lack of means to bring on their mounts after an action on foot. Therefore, in order to gain the maximum effect from available infantry, it will be necessary to move them from point to point and from resting-place to within range of the enemy by mechanical transport.

*Equipment.*—If infantry is to possess an adequate agility, its weapons and ammunition must be lightened to an appreciable extent or they must be carried for him. In fact, the infantryman of the future must be regarded as an athlete. Every article which he does not need in the combat itself must be discarded or carried for him on accompanying transport. It is likely that a lightened form of the present web equipment will be worn in order to support his cartridge pouches, smoke bombs and side-arms. Leather as a material is too much affected by exposure to rain. The ideal to be aimed at in the design of the equipment is that no straps should hinder the freedom of the wearer's chest. The bandolier is inconvenient and uncomfortable; nor should any great quantity of ammunition be carried. In the British army it is probable that puttees will be retained. They are more flexible, less rigidly binding, less hot than leggings, whilst they give greater protection from weather and abrasions than do stockings. This argument also applies to boots rather than shoes—which do not support the ankle—but a lighter pattern might be supplied.

*Tactical Methods.*—Infantry to-day has at last shaken itself free from the morass of methods based on theories of mechanics rather than of human nature, and has got its feet firmly placed on bed-rock principles of fighting. But in the attack particularly there remains a problem unsolved. The infantry unit has learned how to deal with any centre of enemy resistance which it encounters in a way which is true to human nature. But in a large-scale battle each infantry unit is only an interdependent and subordinate working part of a vast machine. The need is to devise a method by which its action can be fitted in and dovetailed with the movements of the neighbouring units and of the machine as a whole. Coöperation between units of the same arm—even more than between the different arms—is the keystone of modern war. These minor units are the moving parts of the car—which is the whole force. The car itself, under the control of its driver, the general commanding, may alter its direction, vary its speed, change its gears, but the actual moving parts within it execute their share on a definite system comprising a certain limited number of cycles of movement which are almost uniform. The essential requirement for the smooth running of the car to its journey's end—victory—is that each moving part should fulfil its rôle in harmony with the others. But the path to victory is a winding one, the car has to round steep corners, and a differential is needed which will compensate the movement of the respective wheels without friction, lest a sideslip ensue. In battle, now that the defence is distributed in depth, it is rarely possible to tell beforehand at what points and moments the different units will encounter the organized resistance of the enemy. The attackers of to-day are faced with the problem of breaking through successive positions, each composed of an irregular series of posts, extending back in layers to a depth of several miles. It is reasonably certain that some units will encounter fewer posts and less resistance in their path than others. A system is therefore needed which will ensure that the progress and momentum of the attack as a whole is not lost, nor friction developed between the moving parts, when delays occur to overcome obstacles in the path of certain sub-units. The minor cycle of the sub-unit must be reconciled with the greater cycle of the superior unit, and with that of the whole force.

A method by which this combination may be achieved has been put forward under the title "expanding torrent." It is based on the fact that where, as in the British army, a unit consists of four parts or sub-units, its forward body will be formed of two of these. Let us take the example of a company. It will happen that one forward platoon is advancing whilst the other forward platoon is checked or delayed in clearing an enemy post. If the platoon which can advance waits for its neighbour, the pressure on the enemy will be relaxed and the chance of exploiting success lost. If it is allowed to go on, tactical unity may be lost and its flanks will be exposed to counter-attack. Hence it is suggested that the commander of the company should follow automatically in the wake of his platoon, which is making progress, and after passing through the gap will push forward one of his manœuvre platoons to take over the frontage of the delayed platoon and lead the advance in its place. At the same time he might use his other manœuvre platoon to assist by a flank attack the originally held-up one to overcome its enemy. The moral effect of being outflanked however is often sufficient. Directly the enemy post has been cleared, the company commander reorganizes and pushes ahead without delay.

The method is equally applicable to the battalion and to higher commanders and is described colloquially as exploiting and enlarging the soft spot by automatic action resembling an expanding torrent. The advantages claimed for it, besides that of maintaining the momentum and breadth of the advance, are:—firstly, that the leading infantry will be automatically composed of those who are freshest and are best supplied with ammunition, because they are those which have encountered least opposition; secondly, that it will no longer be necessary to fix definite topographical objectives for each small infantry unit, for to limit the advance of unexhausted units which can make progress is a violation of economy of force and the exploitation of success; thirdly, that the coördination and control of the advance will rest with the superior commander rather than depend on coöperation between the platoons themselves. The driver will keep control of his car, instead of losing it as in the past.

*Wanted: a Battle Drill.*—A further development in tactical methods which has been mooted is a controllable system of movement on the battle-field. At present armies retain drill movements for the parade-ground and throw them aside when they go on active service. As human nature in battle retains only that which has become instinctive habit, it is scarcely surprising that in movements of crisis one has seen men advancing,

against the deadly fire of machine-guns, in close-packed lines. But if drill were brought up to date on the lines of open order and the group, it is probable that moments and even hours of priceless value would be saved, during the approach at any rate. But even during the actual attack, there might well be occasions when an ingrained method of control could be used to quicken the manœuvre of deployed units and direct them to take advantage of local situations. Voice control would be out of the question, but if signals were few and simple, visual control might be used, particularly if a clearer means of signalling than the hand were devised. Let anyone with experience of war ask himself if there were not moments in his recollection when he might, had his men been drilled in such a system, have saved precious minutes, an opportunity which never returned, by the use of a signal instead of the slow method of sending a message by runner. The old close order was under control, but modern fire made it impossible. With extended order the battle degenerated into the chaotic movements of an uncontrolled mob. An ingrained system of battle drill, in which intervals and distances were purposely exaggerated, would enable sub-units to be manœuvred, to be opened or closed in "concertina" fashion according to the ground and local circumstances. Such a system might go far to combine the flexibility of the old with the invulnerability of the modern formation.

In defence the probable development of the new power of manœuvre would seem to indicate that in future the infantry will be so disposed as to encourage the attacking enemy to penetrate into channels in which he can be raked by flanking fire. The posts would be sited to support each other by raking fire, rather than to fire direct to a flank. They might even be échelonedbackwards along the natural avenues of approach to form gradually contracting funnels raked by fire, with preconcerted signals to bring down a hail of artillery projectiles at the best moment.

It seems improbable that in the future we shall see the extensive and elaborate field fortifications of 1914–8. The new mobility brought in by the tank, the caterpillar tractor, the aeroplane, would appear to prevent the possibility of the long-drawn stagnation which produced the labyrinthine entrenchments in the World War. The infantryman will be trained for future war to dig temporary cover, not mausoleums of mud.

(F. I. M.)

**INFLATION.**—As with most economic terms in popular use, analysis shows that "inflation" has different meanings with varying contexts. It is sometimes used as equivalent to a general rise in prices, but a general rise in prices may be due to causes primarily associated with commodities, *e.g.* scarcity. Even if the term is confined to money (metallic and representative) it is possible that a general rise of prices may take place which although due to monetary causes cannot properly be described as due to inflation. In former times a frequent cause of a rise in prices was the debasement of metallic money. Debasement does not of necessity mean depreciation, and the depreciation need not be in exact proportion to the debasement. Much of the reasoning of Thorold Rogers, in his great work on the *History of Agriculture and Prices*, on the debasement of the English currency by Henry VIII. was vitiated by the failure to recognize that debasement of money in general only acts on prices in so far as the debasement leads to an increase in quantity. Such an increase in the quantity of money consequent on debasement is not usually called inflation, though clearly analogous.

A general rise in prices may also take place through an increase in the metal or metals available for money although there is no debasement of the coinage. The rise in prices in the 16th century so far as due to the new silver, and in the 19th century the rise due to the new gold in two periods, can hardly be described as caused by inflation. The gold standard implies that values are measured in terms of a certain weight of gold of a certain fineness in any country in which the gold standard is effectively maintained. In different countries values on the gold standard are compared by the amount of fine gold in the standard coins. Very great discoveries of gold, or even the artificial production of gold, would not of necessity mean any departure from the maintenance of the gold standard. Prices might rise indefinitely and the value of gold relatively to things in general fall indefinitely, but it would seem a misuse of language to speak of the "inflation" of gold. Such an increase of gold may and probably will cause an increase in prices, but in neither case is the increase of gold properly called inflation.

In the interpretation of popular terms there is, of course, no decisive test, as the usage varies; but by the application of the historical method the origins of the different meanings may be traced, and the search for the meanings will, as Sidgwick showed, throw light on the corresponding facts.

Before the World War the term "inflation" was in general applied to paper money. The paper money was thought to be inflated when the amount was greater than if the paper were strictly convertible or definitely related to the metallic standard. From this point of view inflation would now mean an abandonment of the gold standard, together with a consequential increase in the quantity of the currency in which prices are expressed. This is the interpretation given to inflation by Francis A. Walker. "A permanent excess of the circulating money of a country over that country's distributive share of the money of the commercial world, is called inflation" (*Political Economy*, 1887). His subsequent treatment shows that Walker had in view an excess of paper money consequent on partial or complete inconvertibility.

In theory it is possible to control an inconvertible paper currency in such a way that there should be neither specific nor general depreciation as compared with gold. But experience shows that, in general, when notes have been made inconvertible they have been subjected to over-issue, with consequent depreciation, specific or general, or both. Over-issue in this sense is another name for inflation.

It seems best, however, to distinguish between the fact of over-issue and the consequent depreciation. Over-issue might take place with inconvertibility, but the depreciation, whether specific or general, might be delayed. The annulment of the restraints imposed by the gold standard allows inflation to take place, but the degree of the depreciation (if any) depends on the quantity of the new paper money (with the credit based on it) and the demand for it.

In the natural course of the progress of a nation, with the increase of population and trade, a greater amount of money is required for cash transactions. With the gold standard in effective working order the additional money required might be obtained by the expansion of convertible notes and of the various forms of bankers' credit, without any departure from the effectiveness of the gold standard. Such was the case in the United Kingdom from the definite establishment of the gold standard with the resumption of cash payments (1821) to the outbreak of the World War in 1914. There was also, it is true, an increase in the amount of gold in circulation and held in reserve, but only sufficient to secure the absolute convertibility of the notes and other forms of credit.

In the same way in periods of speculation and of trade activity there is, no doubt, an abnormal demand for currency and credit, and both are extended until the limitations imposed by the gold standard are reached. If these limits are overstepped there is a monetary crisis. We speak of cycles of expansion and of depression of trade (in the widest sense), but it is only when the expansion of the "money" used exceeds certain limits that it can be properly called inflation. There may be a legitimate expansion to meet the legitimate expansion of trade.

We are well advised under modern conditions to confine the term "inflation" to such *abnormal* increases of currency and credit as transcend the limits imposed by the gold standard. Over long periods there may be a normal increase of money and of money-substitutes, and there may also be normal increases from time to time for short periods according to the activity of trade or exchange in the widest sense. Such increases of currency and of credit would not properly be called inflation.

The term "inflation" as applied to paper money may be compared with the debasement of standard coins. Debasement is in general a symptom of disease or disorder of the monetary system. It is a departure from the standard (or specific depreciation); and if, as usually happens, it is associated with an increase in the quantity of the money after a point it must lead to general depreciation of the currency. If not associated with an increase of quantity the debasement would be simply equivalent to the institution of a seigniorage. In the same way inconvertible notes may be regarded as coins with a seigniorage of 100% (Walker); in other words the amount of fine metal supposed to be attached to the paper is nil. Nothing is left of the standard coin but the name. In this case the value of the paper is determined by its quantity related to the effective demand for it.

It is clear from the foregoing discussion of the meaning of the term that "inflation" is closely associated with other monetary expressions and is sometimes loosely used as equivalent to one or more of them. We speak of inflated values (or prices) of commodities, as for example in comparing present foreign trade returns with the pre-war figures. In periods of financial speculation it is usual to speak of the inflation of securities. Prof. W. R. Scott, in his *History of Joint Stock Companies*, constantly uses the term inflation in describing the rise in the prices of shares in the period of the South Sea Bubble (1720). It may, perhaps, be said that values of securities are inflated when they bear no proper relation to their earning capacity or to their exchange value under normal conditions.

The term "inflation" is also commonly associated with depreciation, and the terms are loosely used as synonymous. Here, however, it is necessary to distinguish between the different meanings of depreciation. A currency might be *specifically* depreciated as regards gold (the standard) simply through discredit, although there was no abnormal increase of quantity. The terms depreciation and appreciation are often applied to gold itself. Gold was said to be depreciated in the third quarter of the 19th century through the gold discoveries, and appreciated in the last quarter through the falling-off in production. But it would be straining the use of words to speak of the inflation and deflation of gold in these periods. During the World War and afterwards there was a great rise in world prices (measured in gold) and in the United States there was a vast increase of the amount of gold for monetary uses. In the United States there was no specific depreciation of paper money relatively to the gold. Gold there had no premium.

The rise in American prices in terms of gold is partly accounted for by the expulsion of gold from Europe by the floods of inconvertible paper. The question arises whether it is correct to speak of this increase in the American gold currency as inflation. There has been, no doubt, an abnormal increase of gold currency as compared with pre-war periods, but there has been no abandonment of the gold standard. Coincidentally, however, with this great influx of gold the passing of the Federal Reserve Act enabled a given amount of gold to support a larger amount of credit, and this extension of credit facilities may be regarded as equivalent to a partial abandonment of the gold standard as compared with pre-war conditions.

At this point the general question arises as to variations in the meaning of convertibility and inconvertibility. There have been in the past all kinds and degrees of suspended and deferred convertibility. The beginnings in Europe of the gold-exchange standard (so well described by Mr. J. M. Keynes in *Indian Currency and Finance*, ch. 2) show also the beginnings of inconvertibility. These incipient gold-exchange standards prepared the way for the ready acceptance of inconvertible paper on the outbreak of the World War (see "Essay on the Abandonment of the Gold Standard," by Prof. J. S. Nicholson, in *War Finance*, p. 34). In the same way the Federal Reserve Act may be said to have prepared the way for an inflation of credit (see E. W. Kemmerer, *High Prices and Deflation*).

In the preceding account of inflation it was implied that under modern conditions the term was only properly applied to cases in which the abnormal increase of money was due to inconvertibility or to the abandonment of the gold standard. The application, however, of the idea of continuity to convertibility and inconvertibility shows that the term inflation may be extended so as to cover the expansion of credit and currency which has taken place in the United States. And in practice most writers speak of inflation in that country as being only less in degree as compared with Europe.

In the United Kingdom during the war the transition from convertible to inconvertible paper was made by such gradual and concealed steps, both in law and in practice, that it is hardly possible to say when the virtual abandonment of the gold standard was officially recognized,—if indeed it ever was.[1] It was only after the war when the foreign exchanges had been decontrolled and when war demands and war scarcities no longer seemed sufficient to account for the great rise in prices, that the abnormal increase of paper money consequent on the abandonment of the gold standard came to be regarded as one of the principal contributory causes of the rise in prices, and it began also to be acknowledged that the currency had been inflated.

In the United Kingdom the great use of cheques and bankers' credits concealed the progress of the inflation as regards the notes. It was commonly said that the increase in the notes was not sufficient to explain the increase in the prices, and that only sufficient notes were issued to provide the small charge for the governmental credits. In this way we arrive at the position that the inflation in the United Kingdom was *primarily* an inflation of credit and not of currency. In other countries, *e.g.* Russia, Austria, France and Germany, the enormous issue of inconvertible notes had the usual effects in a more direct manner. The case of the United Kingdom, however, is not so different when analyzed as at first sight may appear. Before the war, when the gold standard was effectively maintained, the necessity of securing the absolute convertibility of all forms of credit, and of keeping London a free market for gold, imposed rigid limits (after a point) on the expansion of credit. If in the war the bankers had not been able to provide notes for the cheques presented (for funds for wages and other cash transactions) the whole system of credit expansion would have broken down. The notes took the place of gold for all internal payments, and for many foreign payments borrowing was resorted to.

Once the notes had effectively taken the place of gold in the United Kingdom, that is to say when gold was no longer used by the public as money for cash purposes, the principle of convertibility was maintained as regards all the other forms of credit and "representative" money. There was never after the first week of the war any hint of a banking crisis. No one repudiated the notes, and the whole monetary system was worked with the greatest smoothness. The only difference was that the ultimate convertibility into gold, if required and as and when required, was no longer recognized in practice. But this one exception was fatal to the stability of the monetary system. In normal times before the war the action of the gold standard was so effective and so quiet that even bankers and those engaged in high finance took it for granted, just as a perfectly healthy man takes for granted the circulation of the blood and the other vital processes. To the present generation the real working of the gold standard was only revealed when the abandonment had been effected. This abandonment gave to the monetary system the power of indefinite expansion, and the necessities of the State in the war and its extravagances after the war made the potential expansion an actuality.

The real meaning of the gold standard and the dangers of abandonment or relaxation were admirably expressed in his own day by Ricardo. Ricardo was all his life engaged in high finance, and in monetary affairs was the leading practical authority. Although he is commonly regarded as the founder of abstract economics, always at the back of his mind was the practical working of the principles which he propounded. He

[1] At no time during the war would it have been definitely admitted by the governor of the Bank of England that the gold standard had been "abandoned" (Ed. *E.B.*).

lived through the period of the bank restriction when the notes of the Bank of England were made inconvertible, and he had this experience to test his reasonings. Two sentences bring out very clearly Ricardo's conception of a standard and of the limitations imposed by a standard on the expansion (or inflation) of paper money. "In the present state of the law [he is referring to the bank restriction on the conversion of paper into gold] the bank directors have the power of increasing or reducing the circulation in any degree they think proper: a power which should neither be entrusted to the State nor to anybody in it" (Ricardo's works, McCulloch's edition, p. 406). The second text is: "The only use of a standard is to regulate the quantity, and by the quantity the value of the currency—and without a standard it would be exposed to all the fluctuations to which the ignorance or the interests of the issuers might subject it."

In other words the use of a standard is to provide safeguards against the dangers of inflation. The best and most effective safeguard is convertibility. All the forms of currency and of bankers' credit ought to be convertible into one another and into gold without let or hindrance. Such convertibility is only guaranteed when the principle of limitation is applied in each case in a way effective according to the circumstances of the case. In some parts of the system the limitation is applied in a very rigid manner, as for example with the token coins. The essence of "Gresham's law" in the case of token coins is that only by limitation can the nominal value be kept up. In the United Kingdom it used to be thought that to support this limitation effectively the legal tender ought also to be limited. Experience (as observed by Prof. Cannan) has shown that the limitation may be secured in other ways. In the case of bank-notes, whether issued by the State or by banks with delegated powers, the principle of limitation has been applied in different ways. In the United Kingdom before the war the limitation of the issues of bank-notes was far more stringent than in any other country. The Bank Act of 1844 came to be known as the cast-iron system. The essence of it was that, after a point, no notes could be issued unless in exchange for an equivalent amount of gold. In normal times there was no elasticity. In times of crisis elasticity was provided by the suspension of the Act. Other countries had other methods of regulating the issues of their paper money. When Jevons wrote his book on *Money* in 1875 he was able to describe in his Chapter XIV. on "Methods of Regulating Paper Currency" no less than 14 different methods, and since that time other important varieties have been introduced. In these different systems the elasticity in normal and in abnormal times varies, but it is only in the case of inconvertible notes that the principle of limitation by reference to the metallic standard is abandoned altogether, and even in that case there is in general some kind of hope deferred that some time or other the link with gold will be restored.

During the World War, in all the belligerent countries except the United States and Japan, the connexion of the notes with gold, that is to say the effective convertibility, was abandoned in practice. No other effective method of limitation was discovered or applied. Instead of limitation there was expansion, in order to make the Government loans effective in monetary purchasing power. The greater the expenditure by the State, so much greater became the volume of the forms of purchasing power, and the issues of notes had to conform to other increases if recurrent banking crises were to be avoided.

*Historical Examples.*—Before the World War there were three notable outstanding cases of inflation in connexion with issues of inconvertible paper. They throw light on the processes and consequences of the inflation after 1914.

The assignats of the French Revolution long formed the classical example in the text-books of the dangers of inconvertible paper. The issues began on what appeared to be, having regard to the circumstance of the time, a reasonable basis. The confiscated lands were more than sufficient in estimated value to meet the deficits of former years and to provide a surplus for the immediate budgets. In Dec. 1789 the Assembly issued assignats of 1,000 livres (£40) each, bearing interest at 5%, to be accepted from purchasers of the nationalized lands. These notes were part of the floating debt, and were, to begin with, not legal tender. It may be observed that the first notes of the Bank of England (1694) were for high denominations and bore interest. In the course of time the interest on the assignats was abolished, the denomination was lowered, the notes were made legal tender as currency, and any pretence of "representing" lands or any other assets was abandoned. In brief, all effective limitation ceased, and the depreciation both specific and general became excessive. In spite of severe penalties against dealings in specie, culminating at last in the death penalty, in the course of time the notes were refused, and by 1796 had become practically worthless. Attempts had been made to substitute other notes mandats or promises of mandats, but there was no effective withdrawal and no real limitation, and the mandats followed the lead of the assignats. In Feb. 1797 all the paper money was demonetized, the mandats being receivable for taxes or land purchase at 1% of their face-value.

The refusal of the paper money began in the French provinces and the circulation was most effective and prolonged in Paris. The analogy with Bolshevist Russia is instructive. There the refusal of the paper money began with the peasants. It is indeed remarkable that the leaders of the Russian Revolution took no warning from the example of revolutionary France. In fact, they advanced more rapidly to monetary destruction. And in Russia there do not seem to have been any of the compensating temporary advantages of inflation. "It is worthy of remark," says a recent writer (R. G. Hawtrey), "that so long as the Paris workmen were ordinarily paid in assignats there were no complaints of unemployment; the high prices attributed to the knavery of speculators were the principal grievance." In Russia unemployment increased with the inflation.

The next great example of inconvertible paper and inflation is furnished by the Bank Restriction in England which began in the year in which inconvertible paper was abandoned in France (1797). The contrast with France is remarkable, and, to begin with, confirms on the positive side the effectiveness of the fact of limitation even when the actual practice is not based on any reasoned principle. The notes of the Bank of England, though inconvertible, were not made legal tender until 1812. They were at first simply debts due by the Bank of England which the bank was not allowed to pay in legal currency. But the notes were accepted by the Government in payment of taxes, and also by the bankers and merchants under a formal agreement amongst themselves. In 1811 Lord King demanded payment of his rents in coin (not paper), and an Act was passed forbidding any differentiation between coin and paper—that is, making illegal the quotation of two prices. Full legal tender was only granted to the notes the next year (1812).

The specific depreciation of the Bank of England notes began in 1800. At this time (and practically up to 1873) gold and silver were ranked equally as precious metals, and the variations in the ratio of their values never departed widely from 15½ to 1. From 1797 to 1818 at Hamburg the highest ratio is 16·25 in 1813 and the lowest 15·04 in 1814. The maximum specific depreciation of the notes in 1813 compared with gold was 136·4, and with silver 134·7 (see table in Hawtrey's *Currency and Credit*, p. 269). By 1816 the specific depreciation relative to the precious metals had practically disappeared. As measured by the exchange on Hamburg the depreciation reached a maximum in 1811 and was about par by 1816.

It is more difficult to estimate the general depreciation as compared with commodities. In 1801 the index number of prices, calculated by Jevons, based on a standard taken as 100 in 1782, had risen from 110 in 1797 to 153 in 1801, after which there was a fluctuating fall followed by a rise to the maximum of 164 in 1810. It is impossible to say how much of this general rise in prices is to be attributed to the inconvertible paper and how much to causes primarily affecting demand and supply of the commodities taken as the basis of the index numbers. The great argument of Tooke (*History of Prices*) was intended to show, by examining the actual records of the circu-

lation and of prices, that the influence of the currency was of little importance compared with demand and supply. Tooke's general argument was weakened by the fact that he laid the chief stress on commodities which were largely affected by the course of the seasons. The modern view from Jevons onwards is that the general rise in prices was in part due to the issues of the inconvertible notes. A reference to the figures shows (Hawtrey, p. 269) that there is no exact connexion between the specific depreciation of the paper and its general depreciation as measured by general prices. Two questions arose in this period on which there was a prolonged controversy which has been revived *mutatis mutandis* by the World War. It was maintained by some that there was no specific depreciation of notes but only an appreciation of gold owing to the exceptional demands for it in connexion with the war. Now, it is argued, there is depreciation of gold. The other allied question was whether the specific depreciation of the notes was the exact measure of the fall in their purchasing power (or general depreciation). Another point of interest in this period was the influence of economic opinion on economic action. The celebrated Report of the Bullion Committee in England (1810)[1] put the case for the resumption of specie payments and a return to convertibility in the strongest way. The principles of the report were due to the influence of Ricardo, although he was not a member of the committee. Later economists have in general approved of the report, both as explaining the facts and as suggesting the only adequate remedy. But the resolutions founded on the report were not only rejected by the House of Commons at the time (1811), but in opposition to them resolutions were carried by Vansittart which it is now agreed were "abundantly foolish." The answers given by the governor and directors of the Bank of England before the committee were described by Bagehot as "almost classical by the nonsense." By some recent economists, however, the policy of the report has been condemned, notably by Prof. Foxwell, in the introduction to the *History of the Bank of England* by Prof. Andréades. It is also now generally admitted that the questions involved in the report are more complex than the framers of the report considered. It is noteworthy that the principles of the report were eventually adopted and became the foundation of the Bank Act of 1844. It is remarkable that Lord Cunliffe's Committee on Currency and Foreign Exchanges, in their "first interim" report (1918), strongly approved of the practical return to the principles of 1844.

The third great historical example of inflation of inconvertible paper is furnished by the American Civil War. The period (1862–79) used to be called by American economists "the inflationist period." In about a year, owing to the stress of the war, 450,000,000 dollars of "greenbacks" were issued, and in the next two years other 200,000,000 dollars of interest-bearing, legal-tender notes were added. In the last year of the Civil War the paper had suffered a specific depreciation as compared with gold of 50%, and there had also been a great rise in prices, partly at least due to the inflation of the currency. In this case the inflation was primarily an inflation of currency and not of credit. At the close of the war steps were taken to reduce the paper money, and the interest-bearing notes were cancelled. The reduction of the greenbacks, however, was made gradual —a monthly maximum of withdrawals being enforced in 1866. From this time onwards to the final restoration of specie payments in 1879 there was a contest between the inflationists and the supporters of "hard" money. The main argument of the inflationists rested on the hardships that follow on a contraction of the currency and consequent fall in prices. For a time the inflationists were successful, and in 1874 a bill was passed through both Houses of Congress actually increasing the paper issues by about 400,000,000 dollars. This bill was vetoed by President Grant and prepared the way for the Resumption Act of 1875, which provided for the resumption of specie payments in 1879. After this year the advocates of what was called "soft" money turned their attention to the coinage of silver.

[1] Reprint, edited by Prof. Cannan, *The Paper Pound* (1919).

The American experience after the Civil War is of special interest as applied to the case of the United Kingdom after the World War. The same arguments were advanced in 1920–1 as regards the hardships and the dangers of any deflation and the relative advantages of rising or at least stable prices. The less extreme supporters of inflation, like their American predecessors, thought that there should be no actual contraction, and that trade and production should be allowed to overtake the extra supplies of money and in that way bring about a gradual restoration to the normal. In the United States, after the Civil War, the actual resumption of specie payments was delayed for 14 years. Although the American inflation at that time was, to begin with, specially an inflation (or abnormal increase) of inconvertible paper, after the Civil War credit influences not only in the United States but in other countries had considerable influence on the extent of the depreciation of the paper. In the first months of the peace the gold value of 100 paper dollars was 70. But although the paper was reduced in three years by over 15% the effect on the specific depreciation was insignificant, 100 paper dollars being worth only 71·6 in gold. After 1869 for three years there was a great rise in the gold value of the paper to 89·5 in 1871, in spite of an absence of contraction. After 1871 there was another reaction followed by another and more marked revival. This want of conformity between contraction and appreciation of the paper (in terms of gold) is explained by Mr. Hawtrey (*op. cit.*, p. 309) as due to the variations in the value of gold consequent on credit movements in Europe. In 1866 there was the Overend and Gurney banking crisis in England. In 1871–3 there was the boom in trade following on the Franco-German War. This boom was accompanied in the United States by an excess of imports, due to the advance of European capital for railway construction.

Enough has been said to show that the relation of the quantity of paper money, even when inconvertible, to changes in specific or general depreciation is by no means simple. Nor is such a result opposed to the "quantity theory" of money in its extended modern form. The value of paper money in terms of gold depends partly on causes affecting the paper (not only its quantity but its credit or discredit), and partly on causes affecting the gold itself—not only the supply available for monetary purposes but the various elements of demand both for monetary and non-monetary purposes. The premium on gold is accounted for by various causes, and it is not the exact measure of the fall in purchasing power of the paper as regards commodities.

This brief survey of the three notable cases of inflation before 1914 shows very clearly that the inflation of the World War period was due to similar causes acting with varying force. The precise effect of the increase in the quantity of the inconvertible paper cannot be isolated. The main point is the abandonment of the effective working of convertibility through which the gold standard makes operative the principle of limitation. But even when convertibility is maintained apparently and by law in the most effective manner, as for example under the Bank Act of 1844, it is quite possible that for the time being *de facto* convertibility may be restrained, and there may be an inflation of paper money and of the credit that rests on paper money for cash payments. The old question as to the possibility of the over-issue of convertible notes has been answered in the affirmative by the practical legislators of every country. In other words every country has imposed special restrictions on the issues of notes. But in the course of monetary progress the over-issue of convertible notes has become of relatively small importance as compared with the over-expansion of credit, at all events in highly developed countries. The connexion of credit with the gold standard is not only through the note issues. In the United Kingdom the cheque has for long been the most important form of currency or means of payment. It is possible that even wages might be paid by means of cheques (a beginning has been made by Messrs. Lever), though still forms of legal tender would be necessary for other kinds of cash payments.

Once, however, convertibility has been definitely abandoned as regards the notes, then one of the great restraints on the

increase of credit also has been abandoned. It is one thing for banks to provide the gold necessary to meet an internal drain, and quite another to get the notes required in exchange for some form of bankers' credit. It is one thing to keep a free market for gold, and quite another for the government of a country to meet the foreign demands for payment by borrowing abroad instead of sending gold. It is one thing to control the movements of gold by changes in the rate of interest, and quite another to let the movements of gold depend on the governmental regulations regarding import and export.

*The World War Period.*—In tracing the progress of inflation during the World War, the case of the United Kingdom is the most instructive and important. It is also the most difficult, because the abandonment of the gold standard which opened the way for inflation was not definitely announced or admitted, and was only realized some time after the fact had been accomplished in practice. The first authoritative recognition that the gold standard was no longer operative in the United Kingdom was that made in the first report of the Cunliffe Committee issued Aug. 1918. It begins with an account of the currency system which had been effectively maintained in the United Kingdom before the war, and it points out that "under these arrangements the country was provided with a complete and effective gold standard." But the report goes on to state: "The course of the war has, however, brought influences into play in consequence of which the gold standard has ceased to be effective." The main steps in this practical abandonment are also well stated in the report. On the outbreak of war it was considered necessary by the Government not merely to give permission for a suspension of the Act of 1844, as had been done on some earlier occasions, but also to empower the Treasury to issue its own currency notes for £1 and 10s. as legal tender throughout the United Kingdom. It may be noted that before the war only Bank of England notes were legal tender (not the notes of other banks), and Bank of England notes were not legal tender by the bank itself. In the bank restriction (*see* above) full legal tender was only conferred on the notes in 1812, *i.e.* 15 years after the beginning of the restriction.

Under the powers given by the Currency and Bank Notes Act of 1914, the Treasury undertook to issue the new notes through the Bank of England to bankers, as and when required, up to a maximum not exceeding for any bank 20% of its liabilities on current and deposit accounts. The amount of notes issued to each bank was to be treated as an advance bearing interest at the current bank rate. Later on, certificates of larger denominations were issued to banks in lieu of notes, to save trouble, and it became the practice for the banks to pay for the notes in other forms of bankers' credit. In this way the principle of limitation as applied to the notes was practically abandoned. What ought to have been barriers to expansion became elastic bands that yielded at the slightest pressure. The reserves were adjusted to the liabilities and not the liabilities to the real reserves. In place of a limited amount of gold that could only be increased by being attracted from other countries, the real banking reserve was now a mass of notes which could be increased on the demand of the banks themselves. It must be said in justification of these very elastic provisions regarding the notes that it was never anticipated that the demand for internal currency would have necessitated extensive recourse to these provisions. At the beginning of Aug. 1914 an extended bank holiday was sufficient to restore confidence in the currency situation. The danger, as events showed, lay in another direction. The banks were made so secure that they imposed no restraints on the demands of the Government. The inflation was made possible by the issues of the notes—but the real inflation began with the expansion of credit. The credits created by the Bank of England in favour of its depositors, under the arrangements by which the bank undertook to discount approved bills of exchange, and other measures taken at the same time for the protection of credit, caused a large increase in the deposits of the bank. At the same time the needs of the Government for funds to finance the war in excess of what was raised by taxation and by real borrowing from the public made it necessary for the bank to create credits in favour of the Government in the shape of Ways and Means advances. The consequence was that the total amount of the deposits of the bank increased from about £56,000,000 in July 1914 to £273,000,000 in July 1915. The balances created by these operations passed, by means of payments to contractors and others, to the Joint Stock banks, and caused an increase in their deposits, which were also expanded by credits created in connexion with the various war loans. The consequence was that the total deposits of the banks of the United Kingdom other than the Bank of England increased from £1,070,681,000 in Dec. 31 1913 to £1,742,902,000 in Dec. 31 1917. This process of credit inflation is correctly described in the Cunliffe report (*note*, p. 4.): "Before the war these processes if continued compelled the Bank of England to raise its rate of discount, but the unlimited issue of currency notes has now removed this check upon the expansion of credit."

The great increase in bank deposits represented a corresponding increase in purchasing power, which in conjunction with other causes (*e.g.* war demands, war obstructions, war scarcities, etc.) caused a rise in prices. The rise of prices in its turn brought about a demand for legal-tender currency for cash payments of all kinds (wages, transport, retail trade, etc.). The war contractors and others had to break up their large credits into smaller credits, and these again were transmuted into legal tenders. "The unlimited issue of currency notes in exchange for credits at the Bank of England is at once a consequence and an essential condition of the methods which the Government found necessary to adopt in order to meet this war expenditure." On June 30 1914 the fiduciary issue of the Bank of England was under £19,000,000, but by July 10 1918 there had been added £230,412,000 in Treasury currency notes not covered by gold.

Compared with the mass of purchasing power indicated by the growth of deposits, and still more effectively by the increase in the clearing-house returns, the increase of notes may seem of relatively small importance. The importance of the currency notes lies not in their mass compared with other forms of purchasing power but in their function as taking the place of gold. Before the war the Bank of England, with a smaller gold reserve than those of other great European banks, supported a far greater mass of credit. Under certain conditions the movement of a few millions of gold was sufficient to threaten a crisis. Severe precautionary measures were taken to prevent the depletion of the ultimate metallic reserves. The quantity of gold was small, but it was necessary. Before the war, periodical warnings were given that the gold reserves were inadequate to bear the possible strain. By substituting currency notes for gold (and by amassing credits abroad), the quantity of gold held by the central bank became of relatively little importance.

The currency notes, as explained above, were never definitely made inconvertible. It was even provided that when they were presented at the Bank of England gold could be demanded. But since it was against the law to make any use of gold money except as currency—*i.e.* it could lawfully be neither melted down nor exported—the presentation of currency notes for conversion in this way at the bank could only lead to unpleasant questions and possibly incriminating answers. The convertibility was, in fact, only nominal or indefinitely suspended.

The legal prohibition of the melting of gold coin, the control both of the exportation and the importation of gold, and the consequent limitation of dealings in gold, severed the link that formerly existed between the values of coined and uncoined gold. Under normal conditions the market price of gold could only differ from the mint price of £3 17s. 10½d. by very small amounts, negligible so far as any premium on gold was concerned. Practically, in London before the war, gold coin and gold bullion were convertible to any extent at very short notice. The actual records of the price of gold in London show the stability of the price within these very narrow variations. Since there was never the least hesitation among the public in accepting the currency notes, the gold coins previously in public use were

gradually withdrawn from circulation by gentle persuasion and the voluntary action of the banks (not by compulsion). Under these conditions it was not possible to discover if there was in fact any specific depreciation of the notes relatively to gold within the country. Spasmodic cases occurred of sovereigns being bought at a premium in 1916, and both buyers and sellers were prosecuted, but at the time the cases were considered as of no practical importance, and it was generally believed that the notes were not depreciated as regards gold. In a paper read by Prof. Foxwell to the Institute of Actuaries March 26 1917 he stated that he was not aware of any depreciation of this kind in Great Britain, though he had been on the look-out for it incessantly. The police-court cases noted above must have escaped his vigilance, but it is quite clear that there was no recognized depreciation in the sense of a premium on gold in terms of the notes during the war.

A specific depreciation of British currency might have been evidenced by the course of the foreign exchanges, especially with countries such as the United States which had preserved the gold standard effectively. But the course of the foreign exchanges is influenced especially in war-time by other factors, and we cannot at once argue from a fall in the American exchange to a depreciation of British currency. In Sept. 1915 there was a considerable fall in the sterling exchange on New York, but after that time the exchanges were controlled and an artificial stability at 4·76½ dollars to the pound sterling was maintained until the control was taken off after the war (1919). It may be observed that the test which the framers of the Bullion Report (1810) thought of the most importance was not applicable owing to the artificial control. It may be added that this artificial control necessitated the incurring of large indebtedness to the United States by England. After the control of the exchanges was taken off there could be no question that the pound sterling depreciated in terms of the dollar, and this old method of estimating the depreciation was revived.

To the great mass of the people of a country, the specific depreciation of the currency, whether measured by the price of bullion or by the course of the foreign exchanges, is of little interest except in so far as it may be a sign of general depreciation or a fall in the purchasing power of the actual currency. The point was well put in a speech by Mr. Reginald McKenna to the shareholders in the London Joint City and Midland Bank on Jan. 29 1921. In discussing the variations in the meaning of inflation he said that one idea runs through all the meanings, namely that inflation is always associated with rising prices. As already explained, a general rise in prices is not in itself inflation, but it is, as experience shows, always associated with it in the sense of abnormal issues of inconvertible paper.

In considering the effects of the inflation (or abnormal issues) of inconvertible paper on general prices two questions must be carefully distinguished:—(1) What is the effect in the country of issue; and (2) what is the effect indirectly on general world prices measured in terms of gold (the old standard).

Under normal conditions, when convertibility of all the forms of currency and credit is effective in the great commercial countries (as before the World War), the level of prices in any one country depends partly on causes operating in that country, *e.g.* tariffs, demand and supply, and partly on the relation of that country to the rest of the commercial world. When the link between gold and paper is broken in any one country, after a point the local issues become of predominant importance. Russia furnishes an example in an extreme form.

In the United Kingdom during the war there can be little doubt that a rise of prices followed on the issues of the currency notes, as shown by Prof. J. S. Nicholson in a paper to the Royal Statistical Society June 1917 (republished in *War Finance*). It was not implied that the rise was simply caused by throwing the new paper into circulation (as in the case of issues of notes in countries where credit is relatively little developed), but account had to be taken of the effect of the issues on the abandonment of the restraining influence of the gold standard. In the paper referred to it was shown that every kind of currency and of credit had expanded. There had been, for example, a very great increase in the silver and bronze coins put into circulation, and on the other side a great expansion of the use of cheques. Within the country the principle of convertibility had been maintained, and the relative amounts of legal tenders of the various kinds and of bankers' credits had increased more or less in like proportions (not exactly for reasons given in Nicholson's *War Finance*, p. 92). As already explained, once the gold standard was abandoned the notes took over the function of gold in restraining or not restraining advances of credit. A comparison with the United States shows also that the rise in general prices began sooner and advanced more rapidly in Britain than in America.

In other countries roughly the local rise was proportionate to the expansion of the local currencies (and bank credits). The differences are best seen and most exaggerated in Russia and Austria-Hungary, but also in France and Germany.

Broadly speaking during the war (and after the war up to the middle of 1920) general prices in most countries were related to the inflation of their respective currencies and the credits based on them. Prices in particular countries were determined to a greater extent by local causes on account of the restrictions placed on international trade in consequence of the war. Account must be also taken of the efforts of governments to maintain control over prices of important commodities, which, though by no means completely successful and in general undertaken too late, had on the whole considerable effect. That is to say, the level would have been higher but for the control. Local prices were also to some extent kept down by the government of the country concerned buying in the foreign markets instead of allowing unfettered competition. This attempt to establish a buyers' monopoly amongst the allied belligerents was applied too late, and was not very effective as against the great trusts which established sellers' monopolies. Still, no doubt, this part of governmental control also affected the price levels of particular countries. The general result was in accordance with former experience—namely that governmental control is a feeble remedy against a rise of prices consequent on the abandonment of the standard. The fundamental difficulty is that a government can only attempt control in its own country in so far as in combination with other buyers it may establish some kind of buyers' monopoly. In other words, world prices still govern world markets, and the local prices have to be adjusted to the world levels. This consideration leads up to the effects of inflation (in the sense of abnormal issues of inconvertible paper and the consequential expansion of other representative money) in particular countries on world prices. In dealing with this second question it must be observed that in the past this influence had to be considered in estimating changes in world prices (or the purchasing power of gold).

The substitution of paper for gold (or the precious metals when there was *de facto* a link between gold and silver) liberates a certain quantity of the gold which can be used for monetary purposes in other countries. In the American Civil War the displacement of metallic money, no doubt, had some influence in raising the general level of prices in European countries. In the World War the vast accumulation of gold in the United States tended, no doubt, both directly and indirectly to raise prices in that country and in that way to affect world prices measured in terms of gold. Similar effects were observed in Japan[1] whilst in Sweden precautions were taken against this

[1] In Japan in 1914 the balance of bank-notes issued over the amount withdrawn was 385,000,000 yen against gold coin and bullion of 218,000,000 yen. In 1919 the balance of bank-notes was 1,555,000,000 yen against 951,000,000 yen of gold coin and bullion. In Dec. 1920 the ratio of gold to notes in Japan was 85·6, the highest of any of the 17 principal countries.

It is stated in the official *Financial and Economic Annual* of Japan for 1920 that in order to make up for the deficiency of subsidiary silver coins caused by the war a large number of paper notes of small denominations were issued of an aggregate value of nearly £20,000,000. Elsewhere the demand for silver for coinage raised the price greatly (maximum 89d. per oz. in 1919). In England the standard of fineness was lowered.

depreciation of gold. The indirect effect of this influence was far greater in the World War than on any previous occasion owing to the vast area affected by the issues of inconvertible paper and the importance of the countries concerned. It is obvious from the experience of the United States that the mere preservation of convertibility and the effective maintenance of the gold standard are not sufficient to prevent a general rise in prices as measured in the gold standard. Gold prices in the sense of " world prices " depend broadly on the quantity of the gold in use for monetary purposes and on the work to be done by it. In the course of the war, paper was largely substituted for gold, and so far as trade was concerned there was less work to be done by the gold. The general effect then of the World War was analogous to that of great discoveries of gold. Such a result was not in itself a necessary consequence of the World War and of the issues of inconvertible paper. It was quite possible as pointed out by Prof. J. S. Nicholson (in a paper of date Aug. 3 1914—republished in *War Finance*, Part II. ch. 1), that the destruction of credit would more than counterbalance the influences making for a rise in prices. In fact, however, instead of any destruction of credit there was a universal expansion. All governments financed their war needs by loans. The United Kingdom alone of European countries met any considerable part of its war expenses by taxation. In France and Germany the great issues of inconvertible notes directly raised prices, and prices were also raised by the expansion of governmental credits exercised in purchasing power. The notes displaced gold, and the gold was used for monetary purposes in other parts of the world, notably the United States and Japan. In other countries the notes took the place of gold as reserves in the banks, and the reserves were much more easily replenished and increased than was possible with gold. In that way, indirectly as well as directly, the issues of the notes tended to raise general prices. All the world over, in spite of the war, indeed in a sense in consequence of the war, there was a great expansion of credit. But this expansion of credit was only made possible by a corresponding expansion of inconvertible notes.

The evils consequent on inflation which had been exemplified in former historical cases were observed in the World War and in the boom that followed up to the end of 1920. Any general rise in prices, from whatever causes arising, brings difficulties of readjustments, and these difficulties are increased when the main causes are connected with paper money. The reason is that the changes consequent on excessive issues of paper, especially if accompanied by excessive expansion of credits, are much more rapid and intense than when the changes are due to increases in the metal or metals used for standard money. A general rise in prices gives at first a relative advantage to traders and employers of labour, as compared with consumers in general and the receivers of wages and salaries. During the World War wages in industries bearing on the war rose far more rapidly than had been the case in former experiences of inflation. At first the idea prevailed in the United Kingdom that the war would be of short duration, and throughout the dangers of defeat were so appalling that monetary considerations seemed relatively of no importance. No effective restraints were put on inflation. The workers soon learned that they had only to ask in order to have. The employers added any rise of wages to the cost, and to the cost as so determined added on again the usual or unusual percentage of profit. In war contracts the general rule seemed to be to calculate the contractors' profit as a percentage of cost, and with rising nominal cost profits rose automatically. When the enormous rise in profits was observed, an attempt was made to catch the excess above the pre-war normal by the excess profits duty. But under the inflationist conditions that prevailed the imposition of this tax led again in many cases to a further rise in prices. The profit-makers were also imbued with the old belief that any tax that could be evaded ought to be evaded, at any rate by all lawful means. It seemed better business to increase expenses of various kinds (*e.g.* by provision for bonuses, for depreciation, etc.) rather than increase profits if two-thirds had to be surrendered to the State. The " profiteering " that arose out of the war was not due entirely to inflation, but it was magnified by the inflation. In many cases, however, the extra profit earned in the war was no more than fair economic remuneration for the services rendered, and in some cases the war profit was low compared with what might have been reasonably expected. In the modern industrial State enterprise cannot be made a matter of routine, and the so-called unearned increment is a necessary and cheap stimulus. In the war the need for speed and quick adjustments was overwhelming. If inflation and excess profits were requisite for the sake of speed, they may indeed be considered as evils but as necessary evils.

It was only after the war when the danger to the national existence had passed away that those who had suffered from the maladjustments of inflation began to complain. Industrial unrest became rampant in every country. The rise in nominal wages in the best of cases had not much exceeded the rise in the cost of living and in some cases it had fallen below. The rise in prices came to be greater in the conventional necessaries of the various classes than in the necessaries commonly so-called. The middle classes suffered far more than the lower wage-earners. A large part of them passed into the ranks of the new poor. It is the middle classes who provide normally the greater part of the brain power of the country in education and the professions and in the advancement of the arts and sciences. During the war they also had provided the greater part of the brain power for the armies and navies. It was galling to the new poor to observe that in the redistribution consequent on the rise in prices their position had been changed for the worse for the advancement of all kinds of " profiteers." Industrial unrest amongst the manual working classes spread to the brain-working classes. By the beginning of 1921 the new poor had been driven, partly by need and partly by disgust, to rebel against the high prices. There were new poor in all countries. A general crisis arose from the side of demand. The effect on wholesale prices was soon apparent in the fall in the index numbers. But for long there was only a partial readjustment in retail prices. In spite of the buyers' boycott retail prices moved but little. This was mainly due to the absence of *bona-fide* competition. The absence of competition spells the growth of monopoly.

During the war there was in the United Kingdom a great growth of trusts. The report of the Committee on Trusts tried to show that little of the rise in prices was to be attributed to the trusts, and that from the governmental standpoint in carrying on the war the trusts had been useful. It had been found more easy to bargain with a combine than with a number of separate bodies. This view of the trusts also found favour with people of socialist leanings, who thought that the growth of the trusts would be indirectly favourable to the socialistic ideal. When the trusts came to own the business of the nation, it would be time for the nation to own the trusts. Whether these favourable opinions of the growth of trusts were sound or not during the period of the actual war, the popular belief is that the fall in wholesale prices after 1920 was prevented from spreading down to the ordinary consumers largely by the influence of the great combines. No official information is, indeed, available to test this belief. In all times there has been a natural dislike of monopolies. This dislike, however, is largely founded on the belief that monopolies mean high prices. The growth of the trusts has been accompanied by a considerable dilution of capital and by a great rise in the rate of interest. The boom after the war was marked by excessive issues of new companies which were largely amalgamations. These amalgamations involved the payment of high interest to the constituent companies. New capital was attracted to provide the connective tissue for these constituent companies, and this again could only be attracted by high interest. The post-war boom was marked by a great increase of interest on industrial preferences and debentures. Here again was a reason for keeping up prices.

*Deflation.*—The question how prices were to fall when interest had to be higher leads to a consideration of deflation. Deflation, as the name implies, is the reverse of inflation. With this meaning it must involve the restoration of the effective

working of the gold standard. An essential part of this process in the United Kingdom must be the actual convertibility of the currency notes. With this object in view Lord Cunliffe's Committee in their Final Report (Dec. 1919) recommended in England that the fiduciary issue of one year should not be exceeded in the next. Under this provision, which was accepted by the Government, the maximum fiduciary issue (*i.e.* the amount of Treasury notes in circulation not covered by gold) for 1920 was fixed at £320,600,000, and that for 1921 at £317,555,200. In the redemption account of the currency notes the amount of gold held remained at £28,500,000 from Dec. 1915 to 1921, but the gold had been supplemented by the addition of £19,450,000 Bank of England notes (up to Dec. 1920), these notes still being regarded as "as good as gold," owing to their being convertible into gold at the bank. The ratio of the gold holding (plus the Bank of England notes) to the currency notes rose from 8·3% in June 1919 to 14·5% in June 1921. In June 1920 the bank rate was raised to 7%, and this high rate was maintained with the view of limiting the expansion of credit. Consequent on the depression that followed the post-war boom the rate was lowered to 6% in June 1921, and to 5½% in July 1921. The high rate must have had some effect in checking speculation and bringing it to an end sooner than otherwise would have been the case. It had little or no effect, however, on the governmental borrowings, and from June 1920 to June 1921 the floating debt actually increased by some £79,000,000. The root cause of the inflation, as already explained, was the governmental expenditure of borrowed (or artificially created) money. It is plain that a high rate for money is not by itself sufficient to check governmental extravagance. Public resentment at the heavy taxation involved by the waste of public money began to be effective at the same time as the resentment against high prices led to a falling-off in demand.

It must be remembered that in case of need—and the Government of the day is the judge of the need—governmental borrowing would be resorted to. In case of need also the amount of currency notes requisite for the smooth working of the credit system must be provided. In case of a financial crisis the banks would always expect the restrictions on the fiduciary issues to be abandoned if necessary. Again, the increase of the reserve against the currency notes cannot of itself insure convertibility. The convertibility could only be effective when the foreign exchanges, especially with the United States, had been restored to the normal. It is not only the notes but all the other forms of credit which must be convertible into gold in case of need if the gold standard is to be effectively reëstablished.

Just as the consequences of inflation (*e.g.* the rise in prices and in nominal wages) must be distinguished from the inflation itself, so also with deflation. The great fall in the index numbers of wholesale prices (United Kingdom) after the spring of 1920 cannot be ascribed to deflation, because in fact there was no deflation in the sense of monetary contraction. The *Economist* index number for March 1920 was 325 (compared with 100 for July 1914), and in Dec. 1920 was 231, whilst from Dec. 1919 to Dec. 1920 the notes in Great Britain had risen from £464,900,000 to £509,859,000. During the same year the bank clearings had risen from £28,000,000,000 to £39,000,000,000. In the same way the bank deposits increased during the year. The banking number of the *Economist* on May 21 1921 showed that the rate of increase of deposits (other than in the Bank of England) was 5·7% in 1920 as compared with 18½% in 1919 and 16½% in 1918. The actual increase in 1920 over 1919 was £136,000,000 in bank deposits (other than those of Bank of England), £12,000,000 in currency notes and £41,000,000 in Bank of England note circulation. In 1921, however, up to end of April currency notes declined £30,000,000 and Bank of England notes £4,000,000 and the deposits of 9 joint-stock banks declined by about £120,000,000.

The want of correspondence between the index numbers of wholesale prices in the United Kingdom and the amount of money (notes and bankers' money) has been cited by some writers as destructive to the "quantity theory" of money. The quantity theory, however, in its modern extended form does not imply that immediately on every increase or decrease of money there must be a proportionate fall in prices. In either case there must be some lag. Even with great gold discoveries it takes time before the effect becomes marked, and similarly as regards a fall in the amount. The opponents of the quantity theory, who assert that the money in use (including notes and bankers' credits) must be adjusted or follow on the movements in prices, are in a worse case. How comes it that when prices have fallen so greatly there has not been a corresponding contraction of "money"? The truth is that the element of time must always be considered. An abnormal increase of money takes time for its full effects to be realized. Similarly any contraction will take time to operate. After a period of inflation when prices begin to fall there will be for a time an apparent abundance of money. An illustration may be taken from what occurred in the great fall in prices from 1873 to 1896. At the depth of the depression of prices there was apparently a superabundance of gold at the great banking centres, and the rates of discount were never so low. Yet the general fall in prices was ascribed to the fall in the production of gold and the greater demand for it for monetary uses consequent on the destandardization of silver.

Not only must time be taken account of, but the survey must be extended to world prices, especially with the restoration of international communications. Prices in the United States after the war had a dominating influence on world prices. In the United States convertibility between the various money forms was maintained during and after the war. The Federal Reserve Act, however, made it possible for a certain amount of gold to support a larger superstructure of credit. At the same time, through the influx of gold from Europe, the gold foundation was also greatly increased. The consequence was that from 1913 to 1919, whilst the physical volume of business (in the United States) increased approximately 9·6%, the monetary circulation increased 71%, and bank deposits 120%. At the same time the percentage of actual cash reserves held against deposits declined from 11·7 in 1913 to 6·6 in 1919. Through the concentration of gold a greater power of expansion was given to the credit within the country, whilst the complete abandonment of the gold standard in Europe took away the restraining effect of a possible foreign drain. In this way, in spite of convertibility being maintained in the United States, the gold standard had not the same limiting effect as before the war. This loosening of the restraints of the gold standard is in fact equivalent to a form of inflation, and American economists (*e.g.* Prof. Kemmerer) speak of American inflation during the war.

It follows from these considerations that the process of deflation must be slow. It seemed probable in 1921 that for a considerable time the fall in prices would continue in the United Kingdom to precede the process of deflation.

Similar reasoning applies to wages and employment. With the great fall in prices money wages must fall, because in the last resort wages are paid out of the price of the product when there is a definite product, whilst wages that are given for services that perish in the act are proportioned to the corresponding disutilities involved as compared with the work of the product-makers. If the fall in prices in the United Kingdom is not due to deflation in the sense of monetary contraction, the fall in wages cannot be ascribed to that cause. When the fall in wages is not readily adjusted to the fall in prices there must be an increase of unemployment. But this unemployment cannot be ascribed to deflation.

The process of deflation must begin with a stoppage of inflation, and the effective prevention of the outbreak of renewed inflation. The essential condition is the stoppage of governmental expenditure that depends on borrowed money or the creation of artificial credits. In other words, the gold standard must be effectively restored.

The assumption that a fall in prices must of necessity be accompanied by a fall in real wages and in employment is not confirmed by the experience of the last quarter of the 19th cen-

tury. Real wages increased during the great fall in prices, and complaints began to be made of the fall in real wages when prices began to move upwards. The charts constructed by Mr. Kitchin (*Times Financial and Commercial Review*, 1921) show that there is no close correspondence between movements in employment and movements in prices under ordinary normal conditions. The great and rapid increase in unemployment in the United Kingdom in 1921 might be partly ascribed to the stoppage of the progress of inflation and the check to speculation.

The fall in prices and in employment may also be partly ascribed to the repudiation of contracts by foreign merchants when they were seen to be unprofitable. This facile repudiation of bargains is symptomatic of the laxity of moral fibre that follows on inflation. This weakening of business *moral* makes it more difficult for governments to meet the obligations of public indebtedness. There has been a revival of old ideas on lessening the burden of public debts by disguised repudiation. It is said that the debts were incurred in depreciated money and therefore ought to be redeemed in depreciated money. It is proposed to stabilize the present level of purchasing power by changing the unit of value. How far such partial repudiation is necessary or desirable for any particular country (*e.g.* Germany) must be decided by the particular country. Even before the war the very moderate proposals for international bimetallism were not found to be practicable.

The essential facts of the situation are that the United States and Japan have effectively kept to the gold standard, *qua* freedom from specific depreciation, and the departure by the United Kingdom as compared with the United States has not been so great as to make the return to the gold standard impracticable. It seems then that world prices will be reckoned on the gold standard, and the national prices of other countries will in the course of time be adjusted to the specific depreciation of their currencies in terms of gold. International trade in the last resort must be carried on in terms of commodities and services. A country cannot for an indefinite period have a stimulus to its export trade simply through the specific depreciation of its currency. So long as the specific depreciation (*e.g.* of the German mark) is greater than the general depreciation as regards purchasing power of labour and other things within the country itself, so long excess profits are earned on exports. But such a condition is obviously unstable. The general theory was explained by Prof. J. S. Nicholson in a paper (Jan. 1888) on the "Causes of Movements of General Prices," republished in the *Money and Monetary Problems*. The argument was primarily applied to the case of gold and silver, and the consequences of the great depreciation of silver relatively to gold, but it was shown that, *mutatis mutandis*, the same reasoning applied to gold and paper. The silver-standard countries found it desirable to adopt a gold or gold-exchange standard, and by analogy the paper-standard countries at present may be expected in time to revert more or less completely to the gold standard.

The gradual return to the gold standard will no doubt be accompanied by a general fall in prices. The fall, which was very rapid in 1920, slackened by the middle of 1921 but seemed likely to be resumed. One obstacle to the continued fall in wholesale prices and the spread of the fall to retail prices was the action of combination in restraint of competition. It is this reliance on combination to keep up prices which is the great obstacle to the policy of ensuring *de facto* deflation by increasing the amount of goods so as to use the superabundant money. When the world is suffering from the exhaustion of the World War and when production ought to be increased as much as possible to restore the pre-war standards of material comfort, it is paradoxical that limitation of production should be anywhere in favour. It might seem to Labour that limitation of hours or of days is a remedy for unemployment (the "lump of labour" theory), and it is possible that in some cases Labour and Capital could combine to insist on monopoly prices. The great obstacle, however, to the success of any such policy of artificial limitation to keep up prices is the difficulty of making all the combines world-wide in their reach.

LITERATURE.—There is already a large literature dealing with inflation and its consequences during and after the World War. No doubt, as after the Napoleonic period, there will be prolonged controversy on the best methods to be adopted in restoring economic and financial equilibrium. The Report of the Committee on Currency and Exchange, which was unanimously adopted by the delegates of the 39 nations present at the International Financial Conference at Brussels (Oct. 1920), confirmed the opinions expressed in the report of the Cunliffe Committee, which was drawn up with special reference to the United Kingdom. The Brussels report may be divided into four sections. The first deals with the meaning, causes and progress of the inflation in the World War, and points to the necessity of stopping the growth of inflation by the limitation of governmental expenditure to revenue and the limitation of the creation of credit to *bona fide* economic needs. The second section calls for increased production. In this connexion the abandonment of governmental control is advocated, but no reference is made to the dangers of limitation of production by the great combines. The third section recommends the return to the gold standard, but the opinion is given that it is useless to attempt to fix the ratio of existing fiduciary currencies to their nominal value. In the fourth section it is stated that deflation must be gradual and that no useful purpose could be served by any attempt to establish an international currency or unit of account to impose artificial control on exchange operations. Supplementary volumes give details affecting various countries of the evidence on which the Report is based.

In the *Financial and Commercial Review* for 1920, issued by the Swiss Banking Corporation, convenient tables are given on p. 5 of the index numbers of the principal countries of wholesale and retail prices (England, France, the United States, Italy, Japan and Germany), and on p. 13 of the gold reserves and paper circulation of 17 principal countries for 1914, 1918, 1919 and 1920.

The following are useful works of reference:—*The Paper Pound of 1797–1821*, a reprint of the Bullion Report of 1910 with introduction by Edwin Cannan (1919); J. S. Nicholson, *Inflation* (1919); R. G. Hawtrey, *Currency and Credit* (1919); E. W. Kemmerer, *High Prices and Deflation* (1920); the four Reports of Section F of the British Association on *Currency and Credit in the War*, edited by Prof. Kirckaldy, 1916–20, have been collated and brought down to the middle of 1921 in one volume entitled *British Finance, 1914-1921*, by Mr. A. H. Gibson; Irving Fisher, *Stabilising the Dollar* (1920); J. S. Nicholson, *War Finance* (2nd. ed. 1918); J. M. Keynes, *Economic Consequences of the Peace* (1920). The work by Yves-Guyot and A. Raffalovich, *Inflation and Deflation* (1921), gives in short compass a very valuable account of former periods of inflation beginning with John Law, and also gives in a short form the leading facts of the actual progress of inflation in the various countries in the World War. The writers reassert the classical opinions on the evils of inflation and advocate as rapid deflation as possible. H. S. Foxwell, *Papers on Current Finance* (1919), criticizes the generally accepted theories of inflation. *The Review of Economic Statistics*, issued monthly by the Harvard Committee on Economic Research, gives not only a general analysis of business conditions with probable forecasts (somewhat on the analogy of meteorological observations and deductions) but provides in a convenient form the statistics of changes in production and in financial conditions. (J. S. N.)

**INFLUENZA** (*see* 14.552).—Under the conditions of existence that prevail in the civilized communities of to-day, the human respiratory tract must necessarily encounter a large variety of pathogenic bacteria and a great deal of irritating particulate matter. Such exposure is inevitable in factories, schools, trains, 'buses and, indeed, in all forms of social intercourse within confined spaces. Under these circumstances it is not to be wondered at that acute catarrhal affections of the respiratory mucous membranes, accompanied by pyrexia, should be common. To such affections the name "influenza" is frequently applied; and it is this loose employment of the word that is responsible for much of the confusion that exists in statistical records.

The explosive pandemic of influenza that burst upon the world in 1918 was something quite different from the sporadic pyrexial catarrhs above referred to, although the individual clinical picture, when uncomplicated, was much the same. In the absence of exact knowledge of the causative agent and in view of the fact that the individual clinical picture is such as may follow many different bacterial invasions, it is impossible, at present, to formulate a completely satisfactory definition. Here the term "influenza" will be used to imply "a pandemic outburst of disease characterized, clinically, by a rapid course, catarrh of the respiratory tract, pyrexia, and some degree of prostration; and, epidemiologically, by a tendency to occur in several successive waves at short intervals of time." This provisional definition is applicable to the visitation of 1918–9, to the outbreaks in 1890–1, in 1847–8, and perhaps to those in 1831–3–7, in 1803, and to other

outbreaks of respiratory catarrh more remote in time and about the distribution of which less is known. It is *not* applicable to the sporadic cases or even the localized epidemics of respiratory catarrh to which the name influenza has been so often applied, especially in the years following fairly closely upon pandemic outbursts. In the years 1908, 1909, and 1915, for instance, unusually large numbers of deaths were returned in London under the heading of "influenza." For the average Londoner, however, there was no influenza in these years; but the average Londoner and, indeed, the average inhabitant of Europe, Asia, Africa, and America, is quite alive to the fact that influenza prevailed in 1918–9. Statistical records of influenza mortality are apt to be very misleading as medical men often apply this name to fatal respiratory diseases of indeterminate symptomatology. When the real influenza comes, the public is at once aware of the fact because nearly everyone either gets infected or sees friends or relations infected within a very short space of time.

*The Influenza Pandemic of 1918–9.*—This pandemic swept over the world in three successive waves, the first appearing quite suddenly in May and June 1918, the second starting at the end of Sept. or early in Oct. and waning in Dec., and the third wave, less uniform in character, appeared early in March 1919.

*First Wave.*—This outbreak, attributed by France to Spain, by Spain to France and by America to eastern Europe, seems to have appeared almost simultaneously amongst the nations of the "Entente" arrayed against the enemy on the western front, and amongst all those communities in intimate touch with them. In the armies of the Entente in France, Belgium, and Italy; in the military camps in England and America; in the civilian populations of England, France, Italy, Spain, and Portugal; in transports at sea; in the closely linked theatres of war of Salonika and Egypt, and in Gibraltar, Malta, and India itself, the outbreak of influenza showed the explosive character that is only possible for a highly invasive infection assisted by conditions of swift inter-communication, such as obtain in modern war.

The invisible barriers of hostility or neutral exclusion seem to have imposed a slight check on its spread so that this first wave made its appearance a little later amongst the Central Powers and their neighbours. It was not until early in July that it attained its full proportions in Germany, Austria, Norway, Sweden and Denmark, Holland and Switzerland. In several large areas of the world's surface, this first wave seems to have been absent or so slight as to have escaped record. In the South American republics, in Bermuda, the British West Indies, the Azores and in the islands on the Pacific, the summer of 1918 seems to have passed without an influenzal outbreak. The same appears to be true of Australia and New Zealand, though cases are said to have appeared in the latter in Aug., the harbingers, perhaps, of the autumn, rather than the first manifestations of the summer, wave.

This first wave passed rapidly, so that a "frequency curve" by weeks, in which the incidence in the worst week is taken as 100%, shows a steep ascent to a maximum, followed by an equally steep and almost symmetrical fall, the whole episode passing within about five or six weeks. So benign was the type that many cases among soldiers at the battle-front escaped record, as the men never "reported sick" but merely rested for a day or so in their units, and this was fortunate as the army hospitals were soon overcrowded. The death-rate was inconsiderable, but there was an ominous tendency to a higher mortality amongst the later cases, just before the wave came to an end, seeming to suggest an increase in virulence. The clinical picture cannot be better summed up than in the words of a consultant physician in France who, describing the first batch of cases, exclaimed "it is like a mild attack of measles without a rash." Respiratory catarrh, congested conjunctivæ, headache, lassitude, pyrexia of short duration, a feeling of prostration with the return of temperature to normal, and then a rapid recovery of health; such was the course in the vast majority of the cases during the first wave. Complications were almost unknown during this outbreak; but a few cases developed broncho-pneumonia or hæmorrhagic œdema of the lungs towards the end of the wave, and it was these cases that sent up the case-mortality. In all these characters, the first wave closely resembled the outbreak of 1890. In one respect it showed an interesting difference. Whereas in 1890 the death-rate was greatest amongst the middle-aged and elderly, in 1918 the chief sufferers were amongst the "young adult" groups.

*Second Wave.*—Towards the end of Sept., or early in Oct., the second wave suddenly gathered force and swept over the world; the crowning tragedy of so many tragic years. Soldiers, miraculously spared in battle and for whom hope was now dawning with the promise of victory; youths at school or college, to whom the future might look to fill the gaps of war in years of peace: these were the harvest chosen for the scythe of the Angel of Death. For the character of the pandemic had changed and the benign attacks of the summer now gave place to the terrible scourge of the autumn outbreak. Geographically, this wave was almost universally felt, and it seemed to mount up simultaneously throughout the world. St. Helena is said to have escaped. Mauritius, too, had a reprieve; and it appears to be true that the quarantine measures applied by Australia were successful for the moment, but throughout Europe, America, Asia and Africa, this fatal pandemic held undisputed sway.

The upward curve of morbidity was almost precisely similar to that of the summer and the maximum was reached as quickly as in the previous wave, but the fall was much slower and less regular. The outstanding difference between the two waves was the marked tendency to pulmonary complications and the high death-rate of the second. The singularly uniform syndrome of the summer epidemic gave place, in the autumn, to several varieties of clinical picture depending on varying combinations of several factors, amongst which might be reckoned the virulence of the microbic invader, the resistance of the patient, the nature of the bacterial flora of his respiratory tract, and environmental conditions such as occupation, wages and housing. As a rule, the attack was ushered in by the catarrhal and pyrexial symptoms noted in May and June. In many cases, especially where circumstances permitted of immediate rest and treatment, the disease took a favourable course towards recovery, although prostration was nearly always a more marked feature than in the summer. In others, the story was different. The early pyrexial catarrh was sometimes followed by intense toxaemia leading so rapidly to a fatal issue that there was no time for pulmonary complications to develop. But in a very large number of cases the lungs became severely affected and the patient passed into a state of anoxaemia recalling that produced by exposure to the "pulmonary irritants" of gas warfare. But there was a formidable difference between the two conditions. While the "phosgene" patient had to deal with a sterile exudate, evoked by a chemical irritant and capable of rapid absorption if vitality was maintained, the lungs of the influenza patient were charged with an exudate evoked by a living virus which had already overcome tissue resistance and could offer to "secondary invaders" conditions of symbiosis favourable to their growth. Here lay the danger. The virus of influenza could open, as it were, the door to the *streptococci*, *pneumococci*, *staphylococci* and other organisms normally held within safe numerical limits upon the respiratory mucous membranes.

Those who wish to be fully informed of the clinical features of this phase of the disease cannot do better than turn to the admirable account of it given by Dr. Herbert French in the "Report on the Pandemic of Influenza, 1918-9," published by the British Ministry of Health in 1920. The appearance of the patient was often very characteristic. Lying quietly in bed without any of the agonized and restless dyspnœa of the "chlorine-gassed" case, he might seem to the superficial observer to be not very ill. But a closer examination would note the dull cyanosis of the lips and ears, the livid pallor of the face, the rapid shallow respiration; while the pulse, though sometimes good, was often "running" and feeble, indicative of toxic action on the heart muscle. In such a case wisdom lay in sparing the patient the fatigue of a comprehensive examination of the chest. The mere effort of sitting forward or turning over, to allow of stethoscopic investigation of the bases of the lungs, was sometimes enough to turn the scale against the sufferer. Where, however, an examination was carried out, it frequently afforded but little information beyond the fact that there was a marked diminution of the breath sounds and a loss of the vesicular quality of respiration. The *post-mortem* appearances, while tending to have certain basal characters in common, varied considerably with the nature of the "secondary invaders" and other factors. In nearly all cases, there was a hæmorrhagic tendency not often seen in other acute lung affections; and this sometimes amounted to a hæmorrhagic œdema involving the greater part of both lungs. "Wet lungs," "dripping lungs," were expressions frequently heard in the *post-mortem* room. Areas suggesting hæmorrhagic infarcts with their bases extending under the pleura were often noticed. The cut surface of the lungs showed, as a rule, peri-bronchiolitis and patches of broncho-pneumonia with a general state of œdema throughout the parenchyma of the lung; or a whole lobe might give the appearances of red or, in older cases, grey hepatization. (For a detailed account of these appearances, together with their morbid histology, see the article by Maj. Tytler, C.A.M.C., in "Special Report Series No. 36" of the Medical Research Council, 1919.)

*Third Wave.*—The third wave had no distinctive characters. It tended to resemble the first wave rather than the second, though pulmonary complications and fatal cases were fairly numerous.

*Etiology.*—As to the causative organism of influenza we remain, after the greatest pandemic in history, still in doubt. This is no reproach to the science of bacteriology. A moment's reflection will show that research, to give conclusive results, must be carried out during the outbreak at a moment when the "pandemic" character gives the stamp of certainty to the diagnosis and the infectivity of the cases is at its height. But so swift is the passage of the wave that it is over by the time that the necessary workers, equipment and accommodation for investigation have been provided. Before 1918 few doubted that the *Bacillus*

*influenzæ* (Pfeiffer) was the cause of the disease. The year 1920 found expert opinion sharply divided into two schools, one upholding the etiological significance of Pfeiffer's bacillus, the other maintaining that the evidence pointed rather to an invisible "filter-passing" virus as the causative agent. This question is ably discussed by Sir Frederick Andrewes, F.R.S., in the Report of the British Ministry of Health (1920) above referred to.

Recent research has proved that there are several serologically distinct organisms included under the heading of *Bacillus influenzæ* and that these vary in virulence for experimental animals. It seems beyond question that pathological changes resembling those of human influenza may be produced by the inoculation of some of these strains. The same, however, can be claimed for filtrates of body fluids, exudates and secretions from human influenza cases, and also for "Nogouchi" cultures from these. The liability of laboratory animals to lung injuries during experimental manipulation introduces a source of error that is very difficult to exclude, and that is equally operative in experiments with Pfeiffer's bacillus and with "filtrates." No final answer can be hoped for until a future outbreak finds us prepared to start our investigations *before* the crest of the wave, though much spade-work can and should be done in non-epidemic periods to narrow down the field of inquiry. One thing is certain: that, with adequate technique, Pfeiffer's bacillus can be isolated from almost every case of influenza. A rôle of vast importance in the production or accentuation of pulmonary complications is played by "secondary invaders," the bacterial flora of the normal respiratory tract, a potentially pathogenic group well calculated to exploit the tissue injuries induced by the influenzal virus. These bacteria were found to vary in different areas; but certain of them, notably the *streptococcus mucosus*, the *streptococcus hæmolyticus*, the *pneumococcus* and the *staphylococcus*, were almost universal. Rarer types were *meningococci, pneumo-bacilli, pyocyaneus* and others. The vast numbers of these organisms that sometimes invaded the injured lung tissues must be seen to be believed. It was common to find them in the blood-stream as "terminal infections" and they were cultivable from the heart-blood after death.

*Epidemiology.*—In the absence of final knowledge as to the causative agent, many points of fundamental importance still remain obscure. Was the pandemic of 1918–9 a sudden awakening to virulence of some germ already widely distributed in western Europe or was it a "new arrival" operating in "virgin soil"? In spite of the weighty arguments for the former view set forth in the Report of the Ministry of Health, we incline to the latter. But the question arises: "Where could such a germ come from?" It seems justifiable to assume that previous pandemics were due to the same agent. No doubt, somewhere, from one pandemic to another, some human individual or chain of individuals carries on the virus until the time shall be ripe for a fresh outbreak.

It is to be noted that the first wave coincided with the arrival of the first large drafts of American troops in Europe. These young contingents, gathered from the remotest ends of a vast continent, meeting for the first time with the dwellers of far cities or countries, each group harmlessly infested with its familiar bacterial commensals but unprotected against those carried by its new neighbours, these freshly improvised troops must have brought into common circulation pathogenic strains that had long remained dormant in isolated and relatively immunized communities. The crowded troopships afforded just the incubation places that would permit of the maturation of such an infection; and Europe, with its crowded concentration areas and billets offered an unequalled opportunity for its spread. The last influenzal pandemic had occurred just 28 years before. There might be a few scattered "carriers" and perhaps some residual immunity among the middle-aged and the elderly; but the adolescents and the young adults would, in 1918, be "virgin soil." It was just these lower age-groups that suffered most.

How, then, explain the second wave with its greater severity? —and the third? Surely, if immunity played a part, these waves would have been much less extensive, much more benign, and confined to those persons who had previously escaped. These are good, but not final, arguments. It is at least possible that the passage of the first wave might leave behind it a virus of exalted virulence, many "carriers" and many "allergic" subjects whose behaviour to reinfection might betray the phenomena of hypersensitiveness of the respiratory surfaces and a tendency to inflammatory exudates on contact with the air-borne virus. Under such conditions a fresh outbreak would be specially likely to arise in the fall of the year, a period of rapid fluctuations of temperature when the chill evenings drive men into the warmth and close contact of crowded dug-outs, shelters and billets.

Such a theory, while presenting many difficulties, has many points in its favour as well. We find it impossible to believe that the so-called "influenza" to which deaths were attributed every year between 1892 and 1918 was the same disease as the fulminating pandemic that followed. Apart from the extreme contrast in invasive power, a glance at the diagrams of Dr. T. H. C. Stevenson, illustrating the distribution of "influenza" mortality by age-groups (Proceedings of the Royal Society of Medicine, Jan. 1919), will suffice to emphasize the essential differences between, let us say, the graphs for 1917 and 1918, the one showing a preponderating death-rate amongst the old, the other, amongst the young. Such differences can hardly leap into existence within a few months. The known facts of increase and diminution of bacterial virulence lend no support to the idea that such a vast alteration is probable or even possible in so short a time.

*Acquired Immunity.*—Many observers have brought forward evidence indicating that morbidity and mortality were less marked, in the second wave, amongst those who had been attacked in the first. The evidence bearing upon this point has been thoroughly analyzed in the Report of the Ministry of Health, chap. vi. (1918–9). After a careful examination of the facts and figures at their disposal, the authors state that "these data show a considerable immunizing power in the summer attacks and we conclude, although with natural hesitation, that it is probable, on the average, that an appreciable degree of active immunity was attained by those who passed through an attack in its first and mildest manifestations."

This is not a very positive expression of opinion but all who study the figures will agree that the authors show a wise reticence. The evidences for immunity are of varying efficiency in different places, and the populations of many areas show no tendency at all to acquired resistance to infection as judged by a comparison between the behaviour of those attacked and those missed by the first wave when confronted by the second.

We believe these data to be unsound as a basis for comparison. It is highly probable that many persons were infected during the summer and yet failed to show appreciable illness. The vast difference that may exist between the numbers *infected* and the numbers *affected* by a bacterial invasion can be judged from what we know of the meningococcus and the diphtheria bacillus. And yet these non-pathogenic infections may confer active immunity as we know from the "Schick Reaction" in the case of diphtheria and from many other examples as well. It is very likely that the mere fact of a previous "attack" is a fallacious guide in classifying populations for inquiry as to their relative immunities. After all, the best evidence of the acquisition of immunity is to be found in the phenomena of natural recovery of the individual and of the disappearance of pandemic waves from the community. The fact that these groups of pandemics are separated by long and fairly regular intervals, as a rule about 20 years, is not without significance in this connexion, since at least this period might be necessary to reduce the residual immunity from the last pandemic to an ineffective level.

*Artificial Immunity.*—No vaccine can be entirely satisfactory unless it is known to contain the virus or germ of the disease in question. The vaccine issued by the War Office and afterwards by the Ministry of Health was confessedly of a provisional nature since the causative agent was still uncertain. Its formula was as follows:—

| | *Per cub. cm. of vaccine* |
|---|---|
| Bacilli influenzæ (Pfeiffer) . . . . . | 400,000,000 |
| Pneumococci . . . . . | 200,000,000 |
| Streptococci . . . . . | 60,000,000 |

Unless Pfeiffer's bacillus be accepted as the causative agent, this vaccine must be described as consisting entirely of the "secondary invaders." As such, its issue was entirely justifiable and its effects were such as might be expected: satisfactory in diminishing complications and mortality but practically *nil* in preventing the disease.

Vaccine, then, cannot, as a prophylactic, help us much at present; nor can we, in the light of recent experience, hope for great results from general measures of hygiene. We have just passed through "one of the great sicknesses of history, a plague which within a few months has destroyed more lives than were directly sacrificed in four years of a destructive war." Lacking exact knowledge, we are vulnerable, and our watchword must be "Research." (S. L. C.)

**INGE, WILLIAM RALPH** (1860– ), British divine, was born June 6 1860 at Crayke, Yorks., the son of William Inge, sometime provost of Worcester College, Oxford. He was educated at Eton, and at King's College, Cambridge, and won numerous honours and prizes during his university career. From 1884 to 1888 he held an undermastership at Eton, and during the last two years of that time was fellow of King's College, Cambridge. From 1889 to 1904 he was fellow of Hertford College, Oxford, Bampton lecturer in 1889, and Paddock lecturer in New York in 1906. From 1905 to 1907 he was vicar of All Saints', Ennismore Gardens, until his appointment as Lady Margaret professor of divinity at Cambridge. In 1911 he became dean of St. Paul's, where his sermons attracted great attention owing to their original power, their caustic criticism of the tendencies of modern life, and a somewhat pessimistic tone which earned for him the sobriquet of "the gloomy dean."

Among his numerous historical and theological works may be mentioned *Society in Rome under the Caesars* (1886); *Christian*

*Mysticism* (1899); *Types of Christian Saintliness* (1915); *Philosophy of Plotinus* (1918); *Outspoken Essays* (1919), and school-books.

**INGLIS, ELSIE MAUD** (1864-1917), British physician and surgeon, was born at Naini Tal, India, Aug. 16 1864, one of the nine children of John Forbes David Inglis, of the East India Co., and Harriet Thompson. After a childhood spent in India and Australia, the family settled in Edinburgh in 1878. She pursued her studies at the school of medicine for women in Edinburgh and at St. Margaret's College, Glasgow, graduating M.B.C.M., and took up private practice in Edinburgh in 1895. She was instrumental in establishing a second school of medicine for women in Edinburgh and doubling the accommodation of the Edinburgh Bruntsfield hospital and dispensary for women and children. In 1901 she raised money to open the hospice in the Edinburgh High Street as a hospital for women, with the double purpose of benefiting the poor and providing greater facilities for the training of women doctors. Single-handed she developed an indoor and district maternity service and trained her nurses herself. In 1906 the women's suffrage societies of Scotland were formed into a federation, of which she became honorary secretary, and for the eight remaining years before the war she was one of the most prominent suffrage workers in Scotland. In Aug. 1914, inspired by her, a special committee of the Scottish federation of women's suffrage societies, aided by the N.U.W.S.S., undertook the organization of the Scottish women's hospitals for foreign service, and raised £449,000. She first went to Serbia in April 1915 to relieve Dr. Soltau at Kragujevatz. In Nov., when Serbia was invaded by Germans, Austrians, and Bulgarians, the Scottish women retreated to Krushevatz, and Dr. Inglis, Mrs. Haverfield and a few others remained behind till Feb. 1916 as prisoners of the enemy to care for the Serbian wounded. In Aug. 1916 she took a unit to the Dobrudja for service with the newly formed Serbian division attached to the Russian army. She died at Newcastle-on-Tyne Nov. 27 1917, the day after her return from Russia with her unit and the Serbian division. The Serbian general headquarters dedicated a fountain to her at Mladanovatz in her lifetime; and she was given the Order of the White Eagle, Class V., and the Order of St. Sava, Class III.

See *Dr. Elsie Inglis*, by Lady Frances Balfour (1920).

**INGRAM, ARTHUR FOLEY WINNINGTON** (1858– ), English divine, was born in Worcs. Jan. 26 1858, and educated at Marlborough College and Keble College, Oxford. His first curacy was at St. Mary's, Shrewsbury, in 1884; in 1885 he became private chaplain to the Bishop of Lichfield and in 1889 head of the Oxford House, Bethnal Green, where he gained much popularity owing to his devoted work among the East End poor. In 1897 he was appointed suffragan bishop of Stepney, which carried with it a canonry in St. Paul's. In 1901, after the death of Dr. Mandell Creighton, he was nominated by the Crown to the see of London. The appointment, which had hitherto been reserved for ecclesiastics of marked ability as scholars or administrators, excited much comment; but it was undoubtedly popular, and this popularity was confirmed when it was realized that the bishop intended to carry on in his new sphere the democratic traditions of his East End activities. As a preacher he proved very successful with simple people, and during the World War he threw himself into the work of providing religious instruction for the fighting men, visiting both the French front and the Grand Fleet.

**INLAND WATER TRANSPORT.**—Before the development of the great railway systems in the 19th century, warfare in western and central Europe depended very largely for its prosecution upon the aid of inland water transport. Even the creation of a good road-network in the late 18th century did not dispense armies from the necessity of using water lines for their heaviest stores, notably siege artillery and its ammunition, while in America, and generally in the less well-developed countries, water routes remained of first-class importance for supply services until railways became available. The part played by the Mississippi in 1862–3 was quite as important as that played by the Scheldt in Marlborough's campaigns or the Niemen and Vilui in 1812.

In western Europe the rapid development of good roads and railways naturally tended to put inland water transport into the background, though in most campaigns it was employed to some extent as an auxiliary and for certain special services for which it was peculiarly suited,—such as the transport of wounded to a base or home, or that of siege guns of unusual weight. But the course of events in the World War, and especially the advent of trench warfare, which demanded enormous quantities of what would formerly have been called siege stores, soon imposed as a necessity the organization of inland water transport on a very large scale. The following account deals with the British I.W.T. organization during the war.[1]

Personnel of the British I.W.T. service were employed at home, in France and Belgium, in Italy, in the Macedonian theatre of war, in Egypt, in Mesopotamia, on the Caspian, in East Africa, and in northern Russia, but it was only on the western front, in Egypt and in Mesopotamia that transport on inland waterways was effected on any considerable scale.

*Great Britain.*—In Dec. 1914 three small establishments—eventually concentrated at Richborough—were formed to supply personnel and material for the I.W.T. service then being constituted for work on the waterways of northern France and Belgium. From Sept. 1916 the growth of Richborough was very rapid; it became the headquarters of the cross-Channel barge service and the scene of numerous other activities. The cross-Channel barge service worked by I.W.T. personnel was instituted to save shipping and to relieve the congestion in French ports. Abroad cargo was being discharged from sea-going vessels to barges for transport to inland depots; if barges capable of passing up the continental canals could be towed across the Channel the demand for ordinary shipping would be reduced, and the pressure on the berth accommodation at the overseas ports lessened. The scheme had other advantages as well: barges, because of their shallow draught, were practically immune from torpedo attack; the loss of a barge from enemy action or any other cause would be less serious than the loss of a ship; the labour of trans-shipment at the overseas ports would be saved.

The dimensions of the type of barge built for the service were governed by the dimensions of the continental canals (*see* under France and Belgium below), but as when crossing the Channel a greater free-board was necessary than when navigating the inland waterways the carrying capacity when crossing the Channel was limited to 180 tons. Towards the end of the war a number of 1,000-ton barges were being brought into use; these could not enter any but the largest inland waterways, but at the overseas ports they could be discharged at berths unsuitable for sea-going ships, and could thus secure most of the advantages which the service was intended to afford.

The service commenced in Dec. 1916, and in May 1917 the returning barges began to be used to convey traffic from France to England. The growth of the traffic is shown in the following table.

*Growth of Traffic.*

| Month | Barges in service | | Average tonnage carried per week | | Traffic to inland destinations | | |
|---|---|---|---|---|---|---|---|
| | 280-ton | 1,000-ton | Outwards | Homewards | Percentage of total | Average load per barge in tons | Turn-round in days |
| Jan. 1917 . | 23 | .. | 1,904 | .. | 100 | 114 | 12 |
| June 1917 . | 105 | .. | 10,625 | 2,182 | 90 | 154 | 10 |
| Jan. 1918 . | 161 | .. | 11,930 | 1,778 | 83 | 123 | 12 |
| June 1918 . | .. | .. | 21,972 | 4,361 | 69 | 125 | 9 |
| Nov. 1918 . | 232 | 10 | 11,898 | 2,013 | 77 | 122 | 15 |
| Dec. 1918 | 245 | 10 | 7,688 | 2,118 | 73 | 134 | 22 |

The total amount of traffic exported from the institution of the service until the end of Dec. 1918 amounted to 1,415,271 tons, of which 1,083,951 tons, or more than three-quarters, passed through the ports direct to inland destinations. More than half of the total was ammunition; bulky stores like hay, vehicles and air-force material were the next largest consignments. The limitations imposed by bridges over the canals on the height to which barges can be loaded account to some extent for the low average load of barges proceeding inland. The tonnage imported from France during the same period amounted to 200,049 tons. By far the greatest part of this traffic consisted of empty ammunition boxes and cartridge cases for re-use and of guns for repair, but many varieties of salvage were

[1] It should be mentioned that the I.W.T. authorities and their organization became by force of circumstances responsible for a variety of activities not strictly connected with transport over inland waterways. These activities are not dealt with here.

carried as well. Richborough was not the only port used, a small proportion of the traffic being to and from Purfleet and other ports on the Thames and Medway. On the French side the only ports with inland waterway communications were Calais and Dunkirk in the N. and ports on the Seine farther south.

The I.W.T. service in Great Britain also undertook a certain amount of transport over British canals, but the total traffic moved during 1918 only amounted to about 150,000 tons, of which the transport of oil on the Forth and Clyde canal accounted for 130,000.

The towage of craft from home to the various theatres overseas demanded of the I.W.T. directorate careful organization, and involved the solution of many problems; during 1917 nearly 700 shallow-draught river craft were despatched to Mesopotamia alone.

*France and Belgium.*—The extensive system of waterways in France and Belgium naturally suggested the use of I.W.T. for military purposes, and a beginning was made in Dec. 1914 by the hiring locally of a few barges for loading with supplies. In Jan. 1915 an establishment was sanctioned and some 36 craft of various kinds were ordered. The service eventually undertook much miscellaneous work, but at the outset its main work consisted of the carriage inland of traffic of no great urgency, such as forage, timber, bricks, stone, sleepers, trench material and ammunition, a large proportion of the traffic being received on barge direct off ship. Another branch of its work was the carriage in ambulance barges from the front of seriously wounded patients unable to stand the jolting inseparable from a journey by train. Another development was the provision of water-supply units, each of six barges, equipped with plant for treating water of doubtful or dangerous quality by filtration and chemicals, thus ensuring a supply of potable water at any point on the inland waterways. Each unit was in charge of an expert chemist and was capable of dealing if need be with poisoned water supplies. A number of floating bridges were constructed so that communication could be opened rapidly across any waterway. Provision was also made for the reopening to navigation of waterways previously in enemy hands, a number of lock gates of special design being among the materials provided for use when required.

During the later stages of the war the necessity of relieving the strain on the French railways led to increased activity on the part of the I.W.T. service. In the winter of 1916–7 its construction branch built or enlarged eight large wharves. It also constructed its own workshops and dry-docks for the repair and maintenance of craft. On the German retreat in March 1917 it repaired and reconstructed the banks, locks, sluices, and removed the obstructions, on the recovered portion of the Somme; after the battle of Arras it reopened the river Scarpe to navigation between Arras and Fampoux. Both in 1916 and 1917 a large amount of pumping was done in connexion with strategic inundation and drainage.

Although the whole of the French and Belgian waterways are linked up, the connexions between those in the N.W. and the remainder were in the hands of the enemy throughout the war, and the only means of communication between the canals in the N. and the Somme and the Seine was by sea. During 1918 a regular service of coastal barges was instituted to ply between the northern canals and the Seine. Much work was done for the French and Americans, coastal trips being worked for the former and craft with crews being lent to the latter to ply on the Seine.

The waterways used varied in size from small creeks up to ship canals, but what may be considered the standard canal was 2 metres deep with 3·70 metres head room under bridges, locks 38·84 metres long and 5·20 metres wide. The standard type of barge in use in northern France has a draught laden of 1·80 metres, beam 5 metres and length 38·50 metres; the maximum height above water-level is 3·20 metres, giving a margin of ·50 metre under bridges to allow of slight variations in the water-level in flood time. The carrying capacity is 280 deadweight metric tons, but the space below hatches (being only about 300 cubic metres) governs, in the case of cargoes of light substances, the tonnage that can be transported, the very limited head room available preventing the carriage of cargo above deck. The British fleet included many self-propelled barges; these carried only 130 tons, but saved time at locks by not having to await the passage of the rest of a convoy. Navigation is not practicable in the dark, and may be interrupted by floods, ice, gales, or fog.

*Egypt.*—Up to the beginning of 1917 such military water transport as was used was controlled by the Royal Army Service Corps. In March of that year an I.W.T. organization was set up of which the principal objects were to relieve the pressure on the railways, to undertake lighterage at the ports of Alexandria and Port Said, and to eliminate competition between Government departments for craft.

The chief waterways operated on were those of the Delta, the Suez Canal, the Ismailia Canal, and the upper Nile, while the bulk of the craft employed were hired locally, only some 50 tugs and barges being obtained by the I.W.T. service from Mesopotamia and England. The principal traffic carried was grain and forage, but a considerable number of passengers were carried as well. Services were run between Cairo and Kantara, Cairo and Alexandria, and Assuan and Cairo. The lighterage work at the ports increased steadily, and by the last quarter of 1918 was greatly in excess of the inland water transport work.

*Mesopotamia.*—In Sept. 1916 the control of river transport in Mesopotamia, up till then in the hands of the Royal Indian Marine, was transferred to the War Office and an I.W.T. organization was set up. The great length and vital importance of the waterways, their physical conditions, the great distance of the theatre of war from home and the lack of suitable personnel, materials and appliances in the theatre resulted in the growth of the I.W.T. service to a size unequalled in any other theatre, and in a much wider range of activities than was the case elsewhere. The distance from Basra to Bagdad by road is 346 m., by river 498, and up to the beginning of 1917 the waterways provided the only possible means of transport on a large scale. The first railways laid in this theatre commenced to work early in 1917, but up to the close of the campaign there was no through connexion by rail between Basra and Bagdad, and carriage by water was the main form of transport employed on the L. of C.; the railways on the L. of C. eased the extreme pressure on the river transport but did not replace it, never effecting more than one-third of the total transport required.

The physical conditions of the rivers rendered water transport on a large scale very difficult. Both the Tigris and the Euphrates are shallow with tortuous and shifting channels; navigation is liable to interruption by floods, low water, strong winds and fog. In the stretch of the Tigris known as the Narrows, extending over a distance of 15 m., the average width of the river is only about 300 ft., and the depth never exceeds 7 ft. as the river overflows its bank when water-level reaches that height above the bed. Over a length of 29 m. vessels proceeding up-stream have to tie up to the bank to allow descending vessels to pass. The requirements of craft in order of priority were shallow draught, strength and power of towing, accommodation for passengers, fuel and cargo capacity. The larger self-propelled craft were paddle or stern-wheel steamers or motor vessels from 130 to 220 ft. long, beam up to 35 ft., draught from 3 ft. 6 in. to 5 ft., speed 6 to 12 knots, average deadweight load about 100 tons. The largest dumb barges, 170 ft. long and 25 ft. beam, carried 200 tons at 3 ft. draught. The number of cots on ambulance vessels varied from 100 to 200 according to the type of vessel. The general conditions and the trying climate demanded of the I.W.T. service the provision of numerous varieties of special craft, such as refrigerator, ice, cold storage, filtration, water and oil storage barges, hydro-glisseurs for despatch service, motor launches and other vessels. The distance from home, some 6,220 m., rendered the transfer to the theatre of lightly built shallow-draught vessels a matter demanding very careful prearrangement; while the voyage from India across the Indian Ocean, always dangerous, was practically impossible during the monsoon. For the erection of craft sent out in parts, and for the maintenance of the large fleet eventually built up, extensive and well-equipped dockyards and shops had to be provided, together with slipways, wharves, storehouses and camps for the numerous personnel.

The organization of the service underwent various modifications due to changing conditions; the work was eventually divided among 13 branches, viz. craft reërection, marine engineering, dockyards, vessels, buoyage and pilotage, construction, conservancy and reclamation, port traffic, transport, native craft, stores, accounts, personnel. The craft reërection branch assembled and launched craft imported in sections. The marine engineering branch decided what hull and machinery repairs were necessary and controlled engine-room personnel and stores; the vessels branch controlled deck personnel and deck stores and fittings. The dockyards branch fitted out vessels arriving from overseas and carried out the repair and maintenance work called for by the marine engineering branch. The main yards were at or near Basra, but there were subsidiary yards and floating repair shops at the principal I.W.T. depots inland. The buoyage and pilotage branch was responsible for facilitating navigation by making fluvial surveys, compiling of sailing directions, marking channels by buoys and beacons, providing pilots, salving sunken craft and refloating stranded craft. This branch undertook minor dredging work, and during the low-water season employed the process known in India as "bandalling," by which temporary training walls of matting fixed on bamboos are constructed to divert water into the particular channel which it is desired to deepen by scour. Reaches particularly subject to shifting silt banks were examined daily, the channels re-marked when necessary, and the available depth of water notified to the loading points. The work of the construction branch was very extensive, including the construction of wharves, jetties, dockyards, workshops, fuel depots, camps, etc., with a great variety of incidental works, such as pumping stations, power houses, pipe lines and a score of bridges, including the bridge at Amara and the Maude bridge at Bagdad. The conservancy and reclamation branch was responsible for heavy engineering work for the improvement of navigation and for the reclamation of low-lying areas at Basra to provide sites above flood-level for camps and depots; for about a year it was also responsible for irrigation. On the Tigris by means of dams and spurs the depth of water at the Narrows was increased, some dredging was done, and bunds breached by the Turks were repaired. On the Euphrates side about 24 m. of channel was dredged to give communication by water between Basra and Nasiriya. The native craft branch controlled the fleet of vessels hired locally. Some had been hired as early as 1915, but in Jan. 1917 all such craft of over 12 tons' capacity were requisitioned and some 50 of them were converted into motor vessels by the fitting of old motor-car engines. The fleet of native vessels did much useful

work, handling at times as much as 30,000 tons a month. From Feb. 1917 to Jan. 1918 the I.W.T. service was responsible for the discharge of ocean steamers to quay or to barge at Basra. All commodities required by the force in the field were carried, the largest quantities consisting of grain, forage and fuel; in addition there was a large traffic personnel and many animals. (A. M. H.)

**INOUYE, KAORU,** MARQUESS (1835–1915), Japanese statesman (*see* 14.587), died Sept. 1 1915. Although he passed the later years of his life in retirement in his villa in Oiso, a seaside resort near Hakone, he was invariably consulted when matters of moment arose in politics or finance, and his name will go down in his country's history as one of the five Meiji statesmen, namely, Princes Ito and Yamagata, Marquesses Inouye and Matsukata and Count Okuma.

**INSURANCE** (*see* 14.656*).—Insurance, or assurance, divides itself into several main classes. Although the distinction is not always observed, the word assurance is usually applied to life business and insurance to the acceptance of risks other than that of life. In an ordinary life assurance or endowment assurance contract the policyholder has the knowledge that either he or his dependents are assured of the payment of a sum on the occurrence of an event that must happen. In the various forms of insurance, such as fire insurance, marine insurance, accident insurance or burglary insurance, the policyholder pays a premium in order to be insured against a contingency which, if he is an honest man, he hopes will never occur.

### UNITED KINGDOM

During 1910–20 there was a pronounced tendency among British insurance companies to amalgamate. The development of the fusion idea began on a large scale when fire-insurance companies absorbed the marine-insurance companies. There were formerly a large number of offices registered in the United Kingdom transacting only marine insurance. In 1921 there were only one or two which had not been taken under the wing of a fire company; and the large insurance offices transacted all the principal forms of insurance. In normal years they derive the bulk of their profits from fire insurance, but during the war period marine insurance proved exceptionally profitable. The earnings from life insurance are comparatively small, owing to the competition of mutual offices which have no shareholders to consider. Underlying all the fusion schemes of past years seems to have been the idea of connexion. The managements considered that it was essential that they should be able to offer to the assured every form of policy, or otherwise the man who was insured against one risk with a particular office would, sooner or later, be induced to effect other assurances with it or to transfer existing policies to it.

The business of the British insurance offices is world-wide, mainly as far as fire, marine and workmen's compensation insurance are concerned. London is a great school for insurance, and credit for much of the development of the business belongs to the underwriters of Lloyd's. Underwriters acting for themselves, or for a few friends, represented in a syndicate, doubtless feel freer to act than the managers of companies who have to report to boards of directors. In any case Lloyd's underwriters have shown a great deal of enterprise in accepting risks of a novel kind and thus in creating new markets. No ordinary life assurance is transacted at Lloyd's.

*Life Assurance.*—Life assurance was fundamentally affected by the World War. It will always be to the credit of British life assurance that, in spite of tremendous blows, no office failed to fulfil any contract into which it had entered. All actual sums assured were paid in full. At the same time, the majority of the offices failed to distribute bonuses on participating policies or else allotted bonuses at a reduced rate. The ill-effects of the war fell upon the participating policyholders. Until the war broke out the progress of the offices had been so steady and their success so great that the likelihood of their being unable to distribute profits hardly entered into the minds of most people. Life-assurance agents, basing their calculations on pre-war experience, were quite able to reason that the participating policies, in many cases, represented much better value than the non-participating contracts. The faith of the public in participating policies was rudely shaken by the experience of the war. There was subsequently a reaction, and non-participating policies became the popular form of contract. This change of feeling was really as short-sighted as the previous blind faith in participating policies. The public was thinking of the passing of bonuses during the war, and forgot that the causes responsible for the passing of distributions, such as heavy depreciation of funds and heavy mortality, no longer obtained, and that, with a prospect of appreciation of security values, the outlook for profits was exceptionally favourable.

Much valuable information on the effects of the war on life assurance was contained in the paper read by Mr. H. Brown, Assistant Actuary of the Commercial Union Assurance Co., before the Insurance Institute of London on Dec. 20 1920. Mr. Brown stated that, excluding offices which transacted industrial life business as well as ordinary life business, and those which had started to undertake life assurance since 1914, there were 44 leading British ordinary life offices at the end of 1920. Thirteen of these maintained, or slightly increased, their pre-war bonuses at their first valuation after the outbreak of war; nine reduced their rates of distribution; and 22 (exactly half the total number) either postponed their bonus distributions or passed five years' bonuses altogether.

During the war the tendency to postpone bonuses steadily increased. Forty-two of the 44 offices mentioned were in the habit of making quinquennial valuations. Of those valuing at or about the end of 1914, 2 out of 10 postponed or passed their bonuses. In 1915 the corresponding figures were 3 offices out of 12; in 1916, 3 out of 5; in 1917, 8 out of 8; and in 1918, 6 out of seven. Almost all the offices made arrangements for the payment of interim bonuses on policies which might become claims before the next valuation, although such rates were usually below those of the pre-war period.

The offices which made their valuations for the five years ended 1914 again came to make quinquennial valuations as at the end of 1919. Of six offices which maintained their bonuses in 1914, only two again maintained them. One of these and also the only office valuing quinquennially which maintained its bonus in 1918 were composite companies not keeping separate investments for their life funds, but content to make good the bulk of the depreciation out of the general funds. Apart from these two special cases, only seven ordinary life offices succeeded in maintaining their bonuses, and four of these, which formerly kept exceptionally strong reserves, absorbed part of these reserves in paying bonuses.

A number of highly important offices made their quinquennial valuations as at the end of 1920. The majority of these made no distribution of profits. Depreciation of securities swallowed up sums which would otherwise have been available. One office paid what was regarded as a satisfactory rate of distribution, its power to do so being due to profits from exchange.

An estimate of the war losses during the five years 1914 to 1918 inclusive was made by Mr. Brown as follows:—

(1) Mortality in excess of the pre-war ratio resulted in a loss of about £3,000,000 a year.
(2) Depreciation in excess of the amount provided for just before the war was estimated at £4,000,000 a year.
(3) The reduction in the net rate of interest due to the high income tax resulted in a loss, as compared with the pre-war period, of about £500,000 a year.

The total loss, as compared with the period immediately preceding the war, could therefore be estimated at, roughly, about £7,500,000 a year during the five war years. In the years immediately preceding the war the total divisible profits of the British offices, in respect of ordinary life assurance, amounted to about £6,500,000 a year, of which about £6,000,000 was divided among the policy-holders, and about £500,000 was distributed among the shareholders of the proprietary companies. During the war the normal profits continued, for the most part, to be realized, subject to the deduction of the special war losses enumerated. The special war losses, it will be seen, exceeded the normal profits of the same period, and it may therefore be

stated that, down to the end of 1918, the war probably cost the life offices, as a whole, about five years' bonuses. Naturally the experience of individual offices varied. Some offices had a larger proportion of lives of military age on their books, and they were therefore more heavily hit by war mortality than others. Then some companies had a larger proportion than others of their investments in Stock Exchange securities, and they were more severely hit by depreciation of Stock Exchange securities. Besides direct war claims, all life-assurance offices were severely affected by the influenza epidemic which swept over the world in 1918 and 1919 and took a very heavy toll of civilian lives.

A growing tendency on the part of insurance companies to issue policies free from all restrictions meant that in the case of the majority of the offices transacting ordinary business the direct war risk in respect of civilians who joined the fighting forces was automatically assumed by the companies. Some companies doing ordinary business and some transacting industrial life assurance had specifically excluded the war risk. Such offices agreed, however, to waive their rights to extra premiums and assumed the war risks. This for the Prudential Assurance Co., by far the largest British office, meant an enormous liability. In the case of professional soldiers assured before the war, policies were issued subject either to a small extra rate during the currency of the policy, or to extra rates of premium when the policyholders were sent on active service. At first an additional premium of £7 7s. % per annum was charged to cover the war risk, but the rate soon advanced to as much as 20% per annum. Such rates were, in the majority of cases, prohibitive, and probably comparatively little business was done on such terms. It is known that even at these rates the majority of the offices, at any rate, would rather have been without it. They could point to the fact that they had assumed vast liabilities in respect of those who had assured before the war as civilians and then had become fighting men. The fact that all men of military age were liable to service meant that, as regards new business, the life assurance offices could not hope to do more than mark time. Their own staffs were reduced to the absolute minimum. Distinguished actuaries found themselves doing routine clerical work, and, for the most part, the male staffs were replaced by women.

The period of the war was undoubtedly the most exacting through which British life assurance offices have ever passed. In addition to the depreciation of funds, heavy claims, and lack of new business, they were adversely affected by the rise in income-tax. The special position of life-assurance offices as regards interest from investments, which really represents their stock-in-trade, had led to some concession under the Finance Act of 1916. The concession was then made that they should be allowed a refund of taxation in respect of their expenses, so that the tax was paid on the difference between interest and expenses, which was naturally very considerable. This concession reduced the effective rate of tax by about one-sixth, or to about 5s. in the £ on the average on the total interest as at the end of 1920, as compared with the pre-war rate of 1s. 3d. In his paper before the Insurance Institute of London Mr. H. Brown pointed out that in 1914 the pre-war net rate of interest of just over 4% was maintained. In that year the rate of tax was practically unaltered. In the four remaining war years the average net rate realized was 3s. % per annum less than the pre-war rate and was a little below 4% net instead of being rather above that figure. The offices during the war period had the opportunity of investing new funds at comparatively high rates of interest, but this increased rate did not go far to compensate for the enormous depreciation which had to be written off the existing funds. In 1921 there was some recovery in the prices of high-class securities, and this fact gave encouragement to the view that the prospect of earning profits was then brighter than it had been for many years.

After the quiet period of the war the figures of new business in 1919 were the largest ever recorded. These, in turn, were exceeded by the results for 1920. The return of enormous numbers of men to civilian life and the greater appreciation of the value of life assurance were evidently responsible for this development. It was hardly to be expected that the figures for 1921 could be as good.

With life assurance under the heavy cloud of the war, little could be expected in the way of devising new schemes of assurance. One office, the Sun Life Assurance Society, continued to develop assurance without medical examination of the proposer. Until the beginning of 1921 such assurances were issued subject to certain restrictions, the terms in other respects, including the rate of premium, being identical with assurances effected in the ordinary way. These stipulations were that: (1) One-third only of the sum assured was secured if the death of the life assured occurred during the first three months from the commencement of the assurance; and two-thirds if the death occurred within the second three months. After that period the claim was payable in full. If death occurred from accident during the first six months the full sum assured was payable. (2) No assignment was permitted during the first two years from the date of the commencement of the assurance. Early in 1921 the Society announced the removal of these restrictions. It professed itself thoroughly satisfied with its experience in assurances effected without medical examination, and, in fact, strongly encouraged proposals made on such terms.

Two or three offices, notably some with their headquarters in Canada, have been developing assurances providing for the cessation of premiums during incapacity, and for disability weekly payments during such periods. Assurances of this kind would seem to be only in their early stages. The ordinary accident and sickness policy is an annual contract, and a life assurance combining disability benefits would seem to have a good deal in its favour.

A rebate of income tax in respect of life-assurance premiums of half the standard rate, or 3s. in the pound, in 1921, was a very considerable encouragement to the effecting of life assurances in the United Kingdom. This meant that £100 of life assurance could be secured for £85. Rebate at this flat rate was obtainable in respect of all policies effected after June 22 1916. In the case of policies effected before that date the rebate was on a sliding scale, being at the rate of half the standard rate of tax where the total income did not exceed £1,000; three-quarters of the standard rate of tax where the total income exceeded £1,000 but not £2,000; and the whole of the standard rate of tax where the total income exceeded £2,000. The rebate was subject to the provision that the total amount of the premiums to be allowed to any individual taxpayer should not exceed one-sixth of the income, and the amount of the premium in respect of which any allowance was made should not exceed £7 % of the capital sum payable at death, exclusive of any addition by way of bonus.

*Industrial Assurance.*—Criticism of the industrial life-assurance system in Great Britain led to the appointment in May 1919 of a departmental committee by the Board of Trade to inquire into the business carried on by industrial assurance companies and collecting societies. Over this committee Lord Parmoor presided. The report of the committee (Cmd. 614) was issued as a Parliamentary paper in July 1920.

The magnitude of the interests concerned was shown by the facts that the total amount of premiums received in respect of policies in the industrial branch of the companies and societies in 1918 exceeded £25,000,000, that the number of policies in existence at the end of that year was about 51,000,000 and that the total number of whole-time and spare-time agents and collectors employed was estimated to be about 70,000. The possible *clientèle* was estimated by the committee at about 35,000,000 persons. From the fact that there were 51,000,000 policies in existence at the end of 1918 and that some millions of these were on the lives of children under ten years of age, in whose cases it is unusual for more than one policy to exist, it was evident that a great number of adults were assured under two or more policies.

Criticism can undoubtedly be levelled against the industrial assurance system on the ground of the high level of working costs. On this matter the committee had much to say. They pointed out that the remuneration of the agents is based upon the amount collected, and is frequently a direct percentage of that sum, varying from 25% in the case of the collecting societies to from 15 to 20% in the case of the companies. In addition to this allowance for collecting his renewal premiums, the agent is directly remunerated for the new business he secures. There are various ways of calculating this allowance, but, the committee pointed out, it is always on a generous basis. In some cases the agent takes the whole of the premiums collected during an agreed period following the issue of the policies, *i.e.* the first 12, 14, or 16 weeks. In other instances lapses are set off against new business, and the new business emoluments of the agent are calculated, wholly or partly, on his increase. Thus the Prudential pays ten times the weekly premium on each new policy provided that it is kept in force for 13 weeks, and 18 times the net increase in the weekly debit. The terms of remuneration vary widely in details, but it would appear that, on the general average, the agents of the companies retain about 25% of all the premiums they collect, while those of the large collecting societies may receive as much as 31 per cent. The committee found that about 44% of the total premium income on industrial policies was absorbed by expenses and commission, and also, where companies were concerned, by dividends to shareholders. Thus on every shilling paid in premiums 5½d. goes in expenses of one sort or another, and only 6½d. comes back to the assured in benefits. Otherwise stated, of £25,000,000 a year paid in premiums by the

insured population, only £14,000,000 come back to them, and £11,000,000 are absorbed in expenses and dividends. The committee stated that they were satisfied that these expenses were too heavy and could be reduced.

Evidence was given before the committee that convenience and economy in collection could be improved by the introduction of the block system, under which an agent is assigned an exclusive area for his operation. This system so far has only been in the experimental stage, but the committee suggested that it should be introduced and extended wherever practicable. It has been put into practice by the Prudential Assurance Co. and has already resulted in a saving of expenses, although the actual effect has been, to a large extent, obscured by the higher scale of wages and the generally increased costs of working brought about by the war.

Lapsing of policies was a matter which received attention from the committee. They pointed out that in the case of one company, the Refuge, whose experience in this matter was held to be in no way exceptional, there were issued in the ten years 1909 to 1918, 9,322,336 policies, while 6,426,313 policies lapsed. Further, it was found that in ten of the offices, including most of the largest, nearly 5,000,000 policies lapsed in 1913, and that nearly 4,000,000 of these had been effected as recently as 1912 or 1913. It was considered probable that the premiums paid on these latter policies amounted to fully £500,000, practically the whole of which would have been absorbed in new business charges, chiefly procuration fees and commissions paid to the agents. Taking all the offices together, it was thought probable that lapses of policies in the year of issue, or in the year following, reached an annual total of 5,000,000. The committee reasoned that this vast figure could only mean that there was a section of the population which was repeatedly induced by the pressure of agents and canvassers to take out policies and discontinued payment immediately that pressure was removed, having lost nearly the whole of whatever premiums it had paid, since the benefit assured at the outset was a mere fraction of the full sum named in the policy. The committee came to the conclusion that, as long as heavy procuration fees were allowed, it would always pay the agents to devote themselves to the ceaseless pursuit of new business among this class of the community, regardless of the value of the policies to the assured or of their being kept up.

It should be noticed that the companies maintain that lapses occurred mostly in the first year or two of assurances before initial expenditure was made good, and that they are thus a source of loss rather than a profit to the companies. Their line of argument seems to be that they have to pay to the agent as fees all the premiums he collects for the first 10 to 20 weeks of the life of the policy, and that if the policy is then dropped the agent has had all the premiums, and there is nothing to help to pay the superintendency and head-office expenses in connexion with the issue of the policy. The offices further contended, in effect, that if the policy lasted a year, the agent had been paid his collecting commission as well as the procuration fee, and, in addition, that they had to pay head-office and branch-office expenses in respect of the issue of the policy, accounting, etc., while they had the risk of the policy becoming a claim, so that even at the end of the year there remained little or nothing out of the premiums paid on the policy. They thus arrived at the conclusion that, on the whole, they lost money by lapses. The committee pointed out, however, that this line of argument seemed to imply that all the expenses relative to new business arose out of the particular policies which the agent succeeded in getting. That is to say he was supposed to earn nothing, and the companies were supposed to incur no expense, in respect of the people whose interest he solicited in vain, the whole of his exertions being regarded as concentrated upon those with whom he succeeded. They doubted whether such an argument was maintainable, and they added that, whoever got the benefit of the premiums paid, whether the companies or their agents, it was certain that the public lost heavily by lapses. The committee recommended that procuration fees should be abolished, and that minimum weekly wages should be substituted based on a fixed collection per week, with a commission on all sums collected above that amount.

The conduct of life assurance by the post-office was also examined. Under the British post-office system life assurance may be effected with Government security at any post-office transacting savings-bank business. Premiums may be paid weekly by means of stamps affixed to premium books handed in quarterly. The average charge for expenses is very low, and the committee held that the terms of assurance ought to be so much better as the result of this than those afforded by the companies that the post-office should be able to issue a large number of policies, in spite of the fact that it neither canvasses nor collects the premiums at the policyholder's door. The number of persons who effect assurances through the post-office is extremely small, and the system as administered by the post-office can, the committee pointed out, only be described as a failure. Apart from the fact that the post-office system was not competitive and provided for no canvass, the committee thought that the system was not operated with sufficient vigour or with due regard to what the public required. The committee found that, although the cost of administration was so small, the sums assured did not compare to marked advantage at any age with those offered by the companies. As one explanation, it was pointed out that the premiums under the post-office plan cease to be payable at 60 years of age, whereas, under the ordinary system, they continue for the whole duration of life or, in certain cases, to the age of 75. Possibly, the committee pointed out, the post-office system was the better one, as official witnesses suggested, but, the committee added, the question was whether the system should offer what the public required or what was thought to be more suitable to the public needs.

In the main, it would seem that the best hope for an improvement of the industrial assurance system lies in a reduction in working expenses. Of this leading managers of companies are doubtless fully aware. During the war period the factors were undoubtedly against them, owing to the rise in the cost of living. In 1910–20 there was a distinct development of industrial assurance on the basis of monthly premiums, and, no doubt, from the practice of this system a substantial reduction of working costs may be expected. The benefits of the system should be developed and the drawbacks overcome.

During the World War the industrial assurance companies in England felt the heavy strain of war mortality claims. They were also adversely affected by the Courts (Emergency Powers) Act, which provided, in effect, that the companies were required to keep in force all policies should the assured be unable, owing to the results of the war, to pay the premiums. There was good reason to believe that the Act was much abused. Practically all those who were not in the fighting forces secured the advantage of the high wages ruling at a time when unemployment practically did not exist. In 1921 the companies under the Act were still required to keep in force a large number of policies on which no premiums had been paid for several years. In addition to receiving no premiums on such policies, they had been called upon to pay claims in respect of many policies of which the holders had been able to benefit by the Act. It was assumed in the summer of 1921 that the Act would shortly be annulled. There seemed a prospect, consequently, that it would come to an end at a time when unemployment was common and there was general financial stringency, so that it would be almost impossible for many policyholders to pay the arrears due, with the result that many policies of long standing would lapse. It was held by some authorities that the Act had been detrimental to the interests not only of the companies but also of the policyholders. The committee recommended, as a way of meeting the difficulties when the Act came to an end, that the policies subject to it should be kept in force for six months after the Act ceased to operate, and that the companies should be required to notify every policyholder to whom the Act applied his right to secure the maintenance of the policy by paying up the arrears, the amount of which should be stated on the notice. Alternatively, that the companies should give the option to the policyholder of maintaining the policy in force for a reduced amount, or in the case of an endowment assurance for an extended period, subject to the cancellation of the arrears, on terms to be approved by the controlling authority.

*Fire Insurance.*—Fire insurance was much affected by the rise in value during the war period. The rise meant that sums previously insured were quite inadequate and additional insurances were effected. The rise was shown in the estimated cost of the principal fires in the United Kingdom. In 1916 these calculations, according to *The Times*, amounted to £3,300,000; in 1917 to rather over £4,000,000; in 1918 to £5,500,000; in 1919 to £9,462,000, and in 1920 to £9,374,000.

On the whole the British insurance companies emerged from the war period in a far stronger position than when they entered it. After the Armistice there was much activity in the formation of new companies, especially of offices to transact re-insurance. In the pre-war years a very large amount of re-insurance had been placed with German companies which had specialized in this form of business, transacting it at a low working cost. During the war naturally no further business was placed with such companies. The limitation of the re-insurance market led, therefore, to the formation of new offices and to the representation in England of companies registered abroad. So long as values remained on the highest pinnacle all the offices did well, but when trade began seriously to decline in the latter part of 1920 the new companies found that matters developed far less favourably for them. Towards the middle of 1921 absorption schemes were announced for a number of

the new companies. Fire managers realized that to conduct a reinsurance business satisfactorily a large capital was needed and only a small rate of profit could be expected.

Before the war, fire-insurance companies had been disturbed, to some extent, by the activities of militant suffragists who set fire to many buildings, including churches. These dangerous activities were to be far exceeded by those of Sinn Feiners after the conclusion of the Armistice with Germany. Immense damage was done to property in Ireland during the course of the campaign of destruction. Insurance companies did not admit responsibility for such damage, special legislation in Ireland providing that the damage could be made good by the local authorities. In the United Kingdom the question of damage of this kind was brought to a head by the destruction of much dock property at Liverpool at the end of Nov. 1920 which was traceable to a Sinn Fein plot. The attitude of the insurance companies generally was that, acting on legal advice, they paid claims under the special riot and civil commotion policies where these had been effected. Where no such special policies existed, or the amount insured under such contracts was insufficient, the loss, or balance of loss, was met under the ordinary fire policies. The insurance companies did not admit liability under such contracts and said that it might be necessary, in order strictly to define the legal position, to take the matter before the Courts.

At the same time, while the insurance companies continued to incorporate in their ordinary fire policies a clause excluding liability for loss or damage caused by riot, civil commotion or military or usurped power, they were prepared, either by the issue of special policies or by the endorsement of existing contracts, to undertake such liabilities, except in the case of Ireland. It is now possible to obtain full protection in respect of the risk of loss or damage by riot, civil commotion, military or usurped power (other than that caused by a foreign enemy), strikers, locked-out workers, or persons taking part in labour disturbances, or malicious persons taking part or acting on behalf of or in connexion with any political organization. In some cases the additional cover is granted for the same rate of premium as that previously charged for riot and civil-commotion risks alone. The risk of fire in respect of private dwelling-houses is included in the ordinary fire policy without extra charge, but, as a rule, a small additional premium is quoted. The wording of the clause giving protection against exceptional risks was, it will be seen, devised with the Irish trouble in mind. It was intended to give complete cover to the assured against risks which were definitely excluded from the ordinary fire policy or might be held, by legal decision, to be so ruled out. A very large number of such special insurances were effected by business men.

*Marine Insurance.*—In marine insurance the dominant feature of the decade 1910–20 was the demand for war insurance, especially during the period of hostilities. The war cloud was affecting business and was a subject of discussion before the storm broke. In a speech at Copenhagen in 1913, Sir Edward Beauchamp, who was then chairman of Lloyd's, made a stir by indicating what would happen if war with Germany broke out. He then declared that, in any event, British underwriters would stand by their contracts. This statement was considered by some to have gone rather far. Yet British insurance companies transacting business in Germany caused statements of similar effect to be published in German newspapers. The subject had in previous years been discussed in German newspapers, an article, in particular, appearing in the *Neue Hamburgische Börsenhalle* in Aug. 1905, under the title of "English Insurances in the event of a German-English War." Its intention appeared to be that of creating uneasiness in the minds of Germans who had effected insurances in England. Confirmation of the attitude adopted by British underwriters was provided by Section V., Annexe III., Paragraph 16, of the Treaty of Peace, which stated that "where the risk had attached effect shall be given to the contract, notwithstanding the party becoming an enemy, and sums due under the contract, either by way of premiums or in respect of losses, shall be recoverable after the coming into force of the present Treaty."

The ordinary policy covering hulls against the risks of marine perils excluded the risks of war. There was, however, in the years immediately preceding the outbreak of hostilities, a tendency on the part of banks to insist that the risks of capture, seizure, detention, etc., should be included. There was a small number of underwriters in the London market who made a feature of war-risks insurance. They studied the political barometer closely and, as regards rates of premium, set the pace. Other underwriters who were by no means enamoured of war-risk business felt obliged to accept such insurances on similar terms for fear that, if they failed to do so, they would lose the ordinary marine-insurance business. On the whole, the acceptance of such insurances proved profitable.

Reference is made in the article on SHIPPING to the establishment of war-risk schemes by the British Government immediately on the outbreak of war. While these schemes continued in operation and were of immense value, a large amount of war-risk business was transacted in the open market.

Some of the difficulties facing underwriters were indicated in a case which was taken up to the House of Lords and became known as the "Restraint of Princes" case. The facts were, briefly, that a steamer, bound from South America to Hamburg, was stopped off the Lizard on Aug. 9 1914 by a French cruiser and was told to proceed to Falmouth. There her master received orders from the naval officer in authority to proceed to Liverpool to discharge. This he did. The owners of the cargo gave notice of abandonment, which the underwriters declined to accept. The old form of marine-insurance policy included among the risks covered "takings at sea, arrests, restraints and detainments of all Kings, Princes, and People." Mr. Justice Bailhache in the first Court, the Court of Appeal, and the House of Lords decided that a declaration of war involving the abandonment of a voyage was a "restraint of Princes," and entitled the assured to claim a constructive total loss. The underwriters had maintained that actual exertion of force was necessary to constitute "restraint of Princes," and that they insured the safety of the goods and not the success of the venture. They urged that, until the action was brought, there had been no suggestion by merchants that "restraint" meant anything but forcible action, which they themselves understood it to mean. In the case which was heard before the Courts the cargo arrived safe and sound at Liverpool. It was the venture which was not carried out as was expected. After this decision underwriters adopted a practice of modifying what was known as the war-risk clause. This had read:—

"Warranted free of capture, seizure, and detention, and the consequences thereof or any attempt thereat, piracy excepted, and also from all consequences of hostilities or warlike operations, whether before or after declaration of war."

For the words "and detention" in this clause there were substituted, after consultation with eminent counsel, the words: "arrest, restraint, or detainment." The opinion was afterwards expressed that, had merchants realized what the law on this subject was, as it was afterwards defined, underwriters might easily have been ruined, for a vast number of cargoes might have been abandoned to them. Yet there was another point of view. As events occurred prices of all commodities rose enormously in the United Kingdom. Consequently, had cargoes been abandoned to underwriters, the latter should have been able to dispose of the commodities at a handsome profit. Further, to meet the new situation a clause was inserted in all policies covering war risks which ran as follows:—

"Warranted free from any claim arising from capture, seizure, arrests, restraints, or detainments by any British Government or their Allies."

This clause was based on one which, soon after the outbreak of war, had been inserted in all insurances against war risks on neutral cargoes in neutral vessels and had read:—

"Warranted free from any claim arising from capture, seizure, and detention by the British Government or their Allies."

The intention of this clause was that neutrals should not collect from British underwriters moneys for goods or vessels which the British or Allied Governments found it expedient to capture, seize, or detain. In one way and another underwriters were able to assist materially in the conduct of the blockade of Germany. In a striking paper read before the Institute of London Underwriters by Mr. E. L. Jacobs, underwriter of the Alliance Assurance Co., it was pointed out that on a hint that the insurance of certain articles was inexpedient, no insurance was provided. Mr. Jacobs declared that: "No proclamation was necessary. A verbal message sufficed: No insurance, no finance, no shipment. Very simple!" A simi-

lar system applied to the insurance of vessels. In the case of these there were black lists. No insurance was available in the United Kingdom in respect of any vessel on such lists.

While the work falling on underwriters and insurance companies was steadily increased, the staffs of the offices were also steadily reduced as more and more men were required for the fighting forces. The difficulties of carrying on business at Lloyd's became immense, and a scheme was introduced which provided for the establishment of a Signing Bureau. An ordinary marine-insurance policy may be underwritten by a large number of syndicates of names, and the signing by hand of the policies by the representatives of all the syndicates was a slow undertaking. A policy might be passing from syndicate to syndicate for many weeks. Objection was raised to any departure from this practice on the ground, *inter alia*, that it was important for the representative of each syndicate personally to see that the terms of the policy were in accordance with the conditions of the insurance as underwritten. In the critical times these difficulties were overcome, and a Signing Bureau was established, which had authority to stamp the policies on account of a large number of individual syndicates and names. As regards despatch, the system had very considerable merits. A policy deposited at the Bureau for stamping was available a very few hours later, completed. Later the system was extended to the settlement of claims, authority being deputed by individual underwriters to the Bureau for that purpose. The practice of stamping the Lloyd's policies on behalf of various syndicates was reflected in the adoption by the insurance companies of issuing a joint policy. Previously each company had issued its own policy and prided itself on doing so. The issue of the joint policy was adopted as an emergency measure, and was not liked by the insurance companies. Most of them agreed to adopt it, but were glad to revert to the individual system later. In order to save paper the size of the policies was reduced during the war, and a standard form of proposal was adopted.

Some underwriters refrained entirely from writing war risks. Nevertheless, it was impossible for them to escape the consequences of the war. Many ships, for instance, became missing. No direct evidence was available as to the loss of the ships, whether through marine or war perils. Vessels were being destroyed promiscuously by the enemy's submarines, and it was clear that, largely owing to this cause, many of the ships became missing. In ordinary times a certain number of vessels set out on voyages and never reach their destination. No trace remains as to the cause of loss. In such cases, after a long interval, the circumstances of the voyage are considered by the committee of Lloyd's. The names of the vessels are then posted in the rooms for inquiry. If nothing, in the meanwhile, is heard of them, the vessels are posted as missing, and settlements are then made by the underwriters in respect of ships and cargo. The position respecting the enormous increase in the number of missing vessels during the war period was considered by a committee representative of shipping ownerships, insurance clubs, Lloyd's, the Liverpool Underwriters' Association, the Association of Underwriters and Insurance Brokers in Glasgow, and the Institute of London Underwriters. As the result of the deliberations, an agreement was drafted providing for arbitration in the event of vessels becoming missing. The underlying idea was that an arbitrator, after hearing such evidence as was possible, could form an opinion as to the probable loss of the vessels, whereas if the question had been taken into court, the proceedings might have been very lengthy, and no better judgment could be expected. In some cases the loss was apportioned by the arbitrator in such proportions among the war-risk and marine-risk underwriters as seemed reasonable.

In the years immediately preceding the war a good deal was heard of over-insurance. Many ships had been built during periods of active trade, and owners found themselves possessed of ships which were worth more to them lost than if still afloat. There was an epidemic of mysterious losses of ships which were, admittedly, over-insured. While suspicions may be formed, the scuttling of ships may be very hard to prove. In order to deal with a difficult situation, which was discussed in a paper read before the Insurance Institute, at the end of 1912, by Mr. Edward F. Nicholls, underwriter to the London Assurance Corp., a clause known as the 15% disbursement clause was prepared, which reads as follows:—

"Warranted that the amount insured for account of assured and /or their managers on disbursements, commissions, or other p.p.i. or f.i.a. interests, other than those hereinafter mentioned, shall not exceed 15% of the insured value of hull and machinery; but this warranty shall not restrict the assured's right to cover premium reducing freight, chartered freight, or anticipated freight to a reasonable amount; provided always that a breach of this warranty shall not afford underwriters any defence to a claim by mortgagees or other third parties who may have accepted this policy without notice of such breach of warranty."

Underwriters considered that by the use of this clause the risks of under-valuation and over-insurance were eliminated. The risk of total loss is naturally coverable at a lower rate of premium than that of all risks, and any owner who had nefarious designs on his ship would have been tempted to secure a large amount of total-loss insurance at as low a rate as possible. It was held that, by limiting the amount which could be covered for disbursements, etc., to 15%, the inducement to an owner to lose his ship was minimized. The disbursements clause has been maintained throughout since its institution.

Following a period of severe competition and heavy underwriting losses, an agreement was reached among the underwriters of the insurance companies and at Lloyd's on the subject of the conditions on which steamers should be insured for time. This agreement laid down the terms on which vessels should be insured, the conditions being reconsidered from time to time. It was carried on successfully for many years, and then collapsed in June 1921. Agreement on certain important points, such as values, rates of premium and the underwriting lead, could not be reached, and it was decided, while maintaining certain terms which are set out in the Institute Hull Clauses, to give underwriters complete freedom on other important points. This was certainly one of the most important developments in the conduct of marine insurance for many years. It meant that the individual initiative and enterprise of underwriters, which had been curbed by the agreement, were once again given free play. Instead of all owners being treated alike, underwriters were at liberty to discriminate between the good and indifferent ownerships. It seemed to be in the interests of the good owners, while it might possibly be to the disadvantage of those whose record is not so good.

There then set in during the summer of 1921 a period of severe competition, although this was restrained, to some extent, by the withdrawal from the market of a number of offices which had been writing considerable accounts during the period of hectic activity traceable to the war and its effects. As long as there was an immense amount of war-risk insurance to be effected, and values of ships and commodities were inflated, there was sufficient business to feed a much-increased and hungry market. When trade became extremely quiet, some of the newcomers thought that they must continue to secure a large share of the business, and the only way they could do so, in competition with the older and more firmly established offices, was to reduce rates of premium. The cutting of rates went on for some time without apparent evil effects, while the more experienced underwriters refused to accept business on such terms. Early in 1921 claims poured in at a rate which had never been experienced even by the oldest underwriters. There was a cataclysm of claims, both in respect of ships and cargoes. The claims in respect of ships were due, especially, to the fact that while tonnage was in active request, repairs, necessitating the laying-up of ships, were postponed, and also to the fact that the repairing establishments were heavily preoccupied in making good damage done to ships through the submarine warfare and the general stress of working under war conditions. A very large number of ships were unfit to go to sea until the damage they had suffered had been made good, and work on such vessels naturally took priority over repairs which could, by any possibility, be postponed. Incidentally, the cost of repairs was steadily mounting for many years, owing to the rise in wages and in the cost of materials. The following figures show the settlements actually made by a leading insurance company on a large underwriting account of hulls. Taking the premium income written in 1916, the first year's settlements amounted to 13%. By the end of 1917 the settlements had risen to 51%; by the end of 1918 to 72%; by the end of 1919 to 84%; and by the end of 1920 to 93%. These figures were only for actual claim settlements. They show that at the end of the fifth year only 7% of the large premium income remained, from which the working costs had to be deducted.

An extraordinary feature of marine underwriting in recent years has been the extended period over which claims have been made. Before the war it was considered that an account might, for practical purposes, be considered as closed at the end of a third year. There

might then be still a few claims unsettled, but not of sufficient magnitude to disturb the main results of the underwriting as then disclosed. After the war no such calculations could be made. The books of the same important insurance company showed that of the 1917 premium income 17% had been settled in claims alone during the first year. By the end of 1918 the total settlements had risen to 56%; by the end of 1918 the settlements represented 72%, and by the end of 1920 89%. The total showed that for the fifth-year settlements 11% of the premium income remained. The earlier figures showed that 9% of the premium income was absorbed in the fifth-year settlements on the 1916 figures, so that if the settlements in the fifth year on the 1917 account were on the same basis, only 2% of the premium income would remain for expenses. It thus appeared that a substantial loss was inevitable. The figures were extracted from the books of a first-class office, and it is only reasonable to assume that those of other offices which were not in the same favourable position would be still worse.

A further factor responsible for heavy claims in respect of hulls was the loss of a number of steamers under remarkable circumstances. Vessels flying certain foreign flags were especially prominent in this connexion. A large number of steamers foundered near land, with little, if any, loss of life. In some cases the vessels were alleged to have struck drifting mines, especially in the Mediterranean. Some of the vessels were lost shortly before the expiration of policies covering them for far larger values than could be insured again. The epidemic was so notorious that underwriters could not feel justified in paying the claims without full inquiry into the mysterious circumstances of the losses. In this matter Government aid was forthcoming. It was, perhaps, unfortunate that a large number of steamers should be at sea insured for very much larger sums than they could be worth under current market conditions.

If, in connexion with the values of shipping, there seemed to be some weakening of the standard of morality, there was an obvious lowering of the ideals in other forms of commerce. Claims in respect of cargo losses were on an enormous scale, and were attributed in large degree to pilferage of goods throughout the world. Legal decisions have been held that there is a distinction between robbery with force and sneak-thieving, or pilferage. The ordinary marine-insurance policy covers the risk of robbery by force, but the risk of theft and pilferage has usually been specifically excluded. Gradually underwriters were asked to accept it, and they did so in various trades, quoting nominal rates for the risk. Then the evil grew steadily to vast proportions—encouraged, no doubt, by the high value of commodities and a laxity induced by the experience of vast numbers of men in the armies, where it was often a question of every man looking after himself as best he could. All classes of business men became alarmed by the growth of the pilferage evil, and committees were formed in the various ports, led by London, to consider what action was required. The shipping companies, who were called upon to pay a vast number of claims, were naturally active in adopting measures, such as the formation of special police forces and the institution of special systems of tallying the cargo on loading and discharging. The marine underwriters, in order, partly, to bring pressure to bear on the shippers and shipowners, resolved to accept only 75% of the shipping value of the goods, thus leaving merchants with responsibility for one-fourth of the value. Early in 1921 there was a strong agitation in the London marine-insurance market in favour of refusing to accept the pilferage risk at all, but this did not seem compatible with the functions of marine underwriters in protecting the interest of their clients. Such action as they did take was undoubtedly successful. It had a good deal to do with a decision on the part of the owners of lighters and barges to accept some responsibility, although of limited character, for the safety of goods carried. Until the matter was brought to a head by publicity and the action of shipping managers, merchants and underwriters, the owners of lighters and barges had, under the London Lighterage Clause, refused to accept responsibility for loss of or damage to goods carried, whensoever, wheresoever or howsoever such loss or damage might be caused. The question had many complications. Thus goods might be resold in course of transit at a profit to the original owners. It was pointed out that a settlement by underwriters of not more than 75% of the shipping value would not be adequate compensation to buyers of the goods at enhanced prices. This matter, in particular, was receiving the careful consideration of underwriters and merchants in the summer of 1921.

*Workmen's Compensation for Injuries.*—Important recommendations respecting the system of compensation for injuries to workmen in the United Kingdom were made by a departmental committee appointed by the Home Secretary in May 1919, which reported in July 1920. The committee was presided over by Mr. Holman Gregory, K.C., M.P., and included representatives of the workers and of the insurance companies. In the introductory paragraphs to the report (Cmd. 816) the committee pointed out that the system then obtaining, which was based on the Workmen's Compensation Act of 1906, imposed on employers a burden of upwards of £8,000,000 a year, and its cost was an item which every business enterprise had to take into account. The total number of workers within the scope of the Act was calculated to be about 15,000,000, and the negotiation and settlement of the claims of those who belonged to organized labour were an important part of the work of trade-union officials. Sixty-five joint-stock insurance companies did workmen's compensation business with employers having a wage-roll exceeding £600,000,000 a year, and their annual premium income in respect of the workmen's compensation risk was well over £5,000,000. Further, there were about 50 mutual indemnity associations which insured their members against the workmen's compensation risk and paid about £2,000,000 a year in compensation. The majority of employers in several of the most important industries in the country covered their risks by this means.

The committee, after examining the subject thoroughly, found that there were certain defects in the system then obtaining, but were of opinion that these defects could be remedied largely without resort to a State system of insurance, although not without the introduction of a certain measure of State control. They proposed that in future at least 70% of the premium income should be expended in benefits to injured workmen or their dependents, and that the remaining 30% should be available for the management, expenses or profits of the companies and the payment of commission to agents, the latter not to exceed 5% of the premium income in any case. They calculated that there would thus be saved on the then cost to employers a sum of between £1,250,000 and £1,500,000 a year which, under the existing organization would be paid away in expenses of management, commission and profits.

In order to provide against the risk to the workman of uninsured employers proving unable to meet the obligations incurred under the Act, it was proposed that every employer other than the Crown, a local or public authority, a statutory company, or householder in respect of servants not employed by him for the purpose of his trade or business, should be required to insure against the workmen's compensation risk. Employers with an annual wage-roll exceeding £20,000 were to be entitled to claim exemption from compulsory insurance upon compliance with prescribed conditions. Householders were excluded from the provision of compulsory insurance because, as the risk of accidents to domestic servants is small, the premium charged by insurance companies is more or less nominal, and also because it was considered that the cost and difficulty of enforcement would be out of all proportion to the number of persons involved. The committee were informed that a large proportion of householders already insured, and they believed that when the proposed increased liabilities were effective "few would be so unwise as to fail to cover their risk by insurance."

The maximum rates of premium were to be approved or fixed by a Government official who was, for convenience, referred to in the report as the proposed Commissioner. It was proposed to bring within the scope of the Act large new classes of persons. These were:—

(*a*) Persons employed otherwise than by way of manual labour whose remuneration is at a rate not exceeding £350 a year (instead of £250 as under the existing Act).
(*b*) Employment of a casual nature for the purposes of any game or recreation where the persons employed are engaged or paid through a club.
(*c*) Taxi-cab drivers who, on the ground that they are the bailees of their cabs rather than the servants of the cab-owner, were excluded from the original Act.
(*d*) Share fishermen employed in the trawler industry.
(*e*) Share fishermen employed in the herring or other fishery to be brought within the Act by order of the Commissioner, if he was satisfied, after public inquiry, that they ought to be included.
(*f*) All persons ordinarily resident in the United Kingdom who were employed, or were travelling in the course of their employment, in a British ship.

Under the original Act the dependents of a workman killed were entitled, under the Workmen's Compensation Act, to a payment of not less than £150 and of not more than £300. Provision was made by the committee for a substantial increase

in benefits. They proposed that, in fatal cases, the benefits for total dependents should be on the following scale:—

(1) Where a widow is left, £250.
(2) Where the person killed leaves a child or children, a weekly allowance of 10s. for the first, 7s. 6d. for the second, and 6s. for every other child. The allowances were to be provided by the payment by the employer into a Central Fund of £500 in every case of a workman dying and leaving a child or children under 15 years of age.
(3) Where other dependents are left, in addition to the benefits mentioned above, a further sum of £500, or where dependents are left, not including widow or children, £250.

The provision for investing money for the children was new. The committee proposed that, in the case of partial dependents, a sum representing the value of the late workman's contributions to the support of the partial dependents should be payable, with a maximum of £250. By the term "support" was meant the provision of the ordinary necessaries of life suitable for persons in their position.

Originally the maximum benefit for total disablement was £1 a week. This sum was raised after Sept. 1917, by two increments, to 35s. a week. The committee proposed that the total payment should be 66⅔% of the average weekly earnings, with a maximum of £3. Since the cash value of an annuity of £3 a week for a man aged 30 might represent £1,500, the liability of employers would become very considerable, and it was this fact evidently which decided the committee to recommend compulsory insurance.

The arrangements for instituting benefits under the Act of 1906 provided that no compensation should be payable for incapacity lasting one week or less; for incapacity lasting more than one but less than two weeks compensation was payable, but only for the days after the first week; for incapacity lasting two weeks or more compensation was payable from the beginning of the incapacity. The committee proposed in future a waiting period of only three days, with no dating back.

Another provision was that any medical and surgical aid necessary, in addition to the medical treatment already available under the National Health Insurance Acts, should be secured for the injured workmen at the cost of the employer under a comprehensive scheme to be worked out by the proposed Commissioner in coöperation with the Ministry of Health.

It was proposed that county court registrars should be appointed to undertake the following duties under the supervision of the registrar:—

(*a*) To give information, free of expense, to injured workmen or their dependents about the benefits provided by the Act and the necessary procedure to protect their rights.
(*b*) To act as mediators between the employer and the injured workman or his dependents on the request of the parties.
(*c*) To be empowered, if both parties agreed, in the event of a dispute as to the workman's condition, to refer the matter to the medical referee, whose certificate should be final.

Power, it was recommended, should be given to the proposed Commissioner to institute inquiries into the practicability of a system of discounts from normal rates in consideration of approved safety devices or provisions, and by agreement with insurance companies and mutual associations to prescribe a practical scheme. The committee was in favour of a substantial increase in the amount of compensation to which priority may be given in the distribution of the assets of a bankrupt employer, and recommended that the amount should be fixed at the full amount of the claim.

The terms of the agreement concluded between the departmental committee on workmen's compensation and the Accident Offices' Association was the subject of some criticism in financial circles. The provision that commission, expenses and profit, if any, should not exceed 30% of the premiums was criticised especially, since it was known that during the previous eight years the average commission paid to agents by a large number of offices had been about 12%, the expenses of management had been about 19%, and the profit about 15%, making a total of about 46%. On the insurance side, however, it was recognised that, even if no committee had been appointed, the companies would have revised their rates of premium in consequence of the favourable effect on the business of the rise in wages during the war period. It was reasoned that the increased benefits recommended by the committee would certainly involve increased rates of premium. Evidently the insurance companies wished to make it quite clear that they had no desire to profit unduly from such developments, and they offered to conduct the business on terms which they hoped would not result in actual loss to them. There was a provision in the agreement that at the end of three yearly periods the rates should be reviewed, so that any deficiency there might be could be taken into account in fixing the premiums for the next triennial period. The insurance companies could well point out that any Government scheme to be inaugurated could not work the system on such favourable terms, and that insurance companies were in a position to do so only because of the efficient organizations which were already in existence.

Legislation was required to give effect to the proposals. This, the Government announced, it would introduce. The time of the Government throughout the first six months of 1921 was, however, much preoccupied with such matters as the coal stoppage, and the necessary legislation was still awaited.

*New Extensions of Insurance.*—In recent years there has been a great extension in practice of the insurance principle. In some directions this progress received a setback on the outbreak of war, while hostilities gave it an impetus in other directions. As an instance of the development of the principle there may be cited insurance against the risks of bombardment of persons and property in the United Kingdom by the enemy from the sea and air. Underwriters were asked very early in the war to cover such risks. Many insurance companies did not see their way to undertake the business, alleging that they had no data on which to work. But some underwriters and insurance companies did undertake the business and wrote a very large amount of it, to the comfort of the assured and, as events proved, to their own profit. Insurances were issued against the risks of damage to, or death of, individuals and against the risk of damage to property. The demand for insurance of this kind grew to very large proportions, and the market was hardly large enough to deal with the whole of it. Thereupon, with the assistance of leading underwriters, a Government scheme was instituted, use being made of the organizations of all the great insurance companies, which acted as agents for the Government in this matter.

The general insurance department of a composite company includes miscellaneous forms of insurance. Among the chief of these is motor-car insurance. During the war comparatively little was done in this form of business. Many private cars were garaged at specially reduced rates of insurance. In 1919 and 1920, when these cars came into use again, the insurance experience was very unsatisfactory. Costs of repairs were on a high scale, and there was an epidemic of thefts. Profits earned from the business in 1919 were small. For 1920 some of the leading insurance companies reported substantial losses. Early in 1921 rates of premium were advanced.

Unfavourable results also followed the transaction of burglary insurance during the two years immediately following the Armistice. This was due to a general epidemic of lawlessness which pervaded Great Britain, and was seen in the wholesale robberies of goods in course of transit. While the large insurance companies are always ready to transact the main forms of insurance, great credit should be given to the underwriters at Lloyd's, who are willing to consider the issue of policies covering every conceivable risk against which the public may legitimately expect to be insured. In this way insurances are effected against the risks of strikes and their effects, against the risks of changes in taxation imposed in budgets and of the special risks of aviation. Risks of the most diverse character are constantly offered, and those underwriters who have been prepared to accept them are known to have secured satisfactory financial results. Before the war efforts of underwriters were concentrated on forming an Aviation Insurance Association, the idea being that one office should be maintained where risks should be

accepted on behalf of a large number of underwriting syndicates and also of two insurance companies. It was recognized that aviation insurance required close study and that one or two underwriters who could give the necessary attention to it could expect to be more successful than those who tried to transact it in addition to many other forms of insurance. The principle was also adopted by many of the leading insurance companies.

Weather insurance was being developed by underwriters at Lloyd's before the war. It was transacted in connexion with the business side of amusements and also in connexion with the spoiling of holidays by wet weather. Naturally little business of the kind was transacted during the war. Yet the importance of the weather upon world affairs was demonstrated again and again during the war. Operations on the western front were frequently affected by the weather, and there is no doubt that the Germans were successful in forecasting it. The battle of Jutland was also affected by "low visibility."

With the resumption of peaceful activities great progress was made with weather insurance. In 1919 the ground was being prepared and a very large amount of data was collected, tabulated and employed respecting the experience in the United Kingdom for many years. In 1920 the volume of business of the kind transacted in the United Kingdom was on a large scale. Insurances were taken out to cover losses due to a falling-off in gate receipts, and to losses of caterers at open-air amusements such as race meetings, cricket matches and regattas. The summer of 1920 in the United Kingdom was wet, and the underwriting experience there was very unfavourable. The business was gradually being extended in foreign fields and the profits which were earned in other countries were believed to have just offset the losses suffered in the United Kingdom. The bulk of the business which had been transacted at Lloyd's was transferred to a leading insurance company, and it was known that the company was satisfied for losses to be on a substantial scale in 1920, because these demonstrated the utility of the business. At one time weather insurance was regarded as a somewhat frivolous form of business, but its importance came gradually to be recognized. It has been realized that there is an immense field open for insurance in connexion with the risk of damage to crops by bad weather. This is a form of business in which large sums of money could easily be lost, and prudent underwriters proceed somewhat carefully with it.

Credit insurance has long been transacted in the United Kingdom by a limited number of underwriters and insurance companies, and in 1920 and in 1921 it was hoped that the principle might be applied to overcome the difficulties caused by the collapse of the credit of some countries especially hard-hit financially by the war. A number of discussions took place between representatives of the Government, banks and insurance companies, but the problem was felt to be beyond the power of the insurance companies generally to solve, and, while the offices showed sympathetic interest in the different schemes discussed, they did not, as a whole, give practical support.

The Insurance Institute movement has developed notably in recent years. It dates back to 1873, when the Insurance Institute of Manchester was formed. The example was quickly followed in other leading centres in the United Kingdom. At the invitation of the council of the Insurance Institute of Manchester the various institutes were asked to send delegates to a meeting held on March 12 1897, at which the decision was taken to form an association to be called the Federation of Insurance Institutes of Great Britain and Ireland. The objects of this federation, as set out in its constitution, were to encourage the study of all subjects bearing on any branch of insurance, to promote the technical education of junior insurance officials, and to do such things as might be deemed desirable to advance the welfare and efficiency of the insurance profession. A scheme of examinations was inaugurated in 1899, which has steadily been developed. The Insurance Clerks' Orphanage was also the outcome of the Institute movement, and has done splendid work amongst the dependents of insurance officials throughout Great Britain. A journal has been published annually since 1898, and the 22 volumes now in print contain papers on all subjects cognate to insurance business. In 1912 the federation received a Charter of Incorporation. The objects of the new Chartered Insurance Institute were set out in 14 clauses, of which the first reads as follows:—

To provide and maintain a central organization for the promotion of efficiency, progress, and general development among persons employed in insurance business, whether members of the Institute or not, with a view not only to their own advantage, but to rendering the conduct of such business more effective, safe, and scientific, and securing and justifying the confidence of the public and employers by reliable tests and assurances of the competence and trustworthiness of persons engaged in such business.

In June 1921 the membership of the Chartered Insurance Institute approached nine thousand. The membership included that of 30 local institutes in the United Kingdom. In addition, seven institutes in British dominions overseas were affiliated to the Chartered Insurance Institute, namely, those of the Cape of Good Hope, New South Wales, South Australia, Western Australia, Victoria, Toronto and the Transvaal. Primarily, the Chartered Insurance Institute is an examining body, and its present curriculum includes all subjects under the headings of fire, life, accident and marine insurance. For the examinations held in 1921, applications were received from 2,530 candidates, who entered for upwards of 12,000 subjects. Simultaneous examinations were held in 43 different centres throughout the United Kingdom. The council decided in 1921 to extend their operations in this connexion throughout the world. The diplomas of the Institute are sought after, and a fellowship diploma, secured as the result of an examination, may well be regarded as a hall-mark of proficiency in insurance business.

(C. MA.)

### UNITED STATES

Insurance in the United States during the years 1910–21 developed along lines of increasing adaptability to the needs of policy-holders and solidified its standing as an essential and reliable financial instrument.

*Extent.*—In practically all lines of insurance the figures show a remarkable increase in extent and variety of risks carried under insurance contracts. This resulted from the need to provide for hazards not previously covered, from the general expansion of business, from the increasing recognition of the desirability of insurance of all kinds as a means of reducing personal and business risk, and from an increased activity on the part of insurance carriers in providing new forms of coverage. There was also considerable activity in the organization of new companies by interests which had formerly specialized in fire or casualty insurance and thus became enabled to offer coverage in all fields with the exception of life.

*Effect of the War.*—The World War affected in greater or less measure all forms of insurance. The seriousness of the resulting problems varied in proportion to the intimacy of the connexion between war hazards and particular kinds of insurance. The insurance business as a whole was affected by war inflation and subsequent deflation, leading to increased expenses, increased taxation, depreciation of securities, increase in interest rates, fluctuating property values, and marked changes in the moral hazard. During the period of inflation there was a general tendency to increase the volume of business, with an improvement in the moral hazard, as it was distinctly contrary to the interests of policy-holders to have losses. With the period of deflation, decreasing values and less intensive industrial activity, insurance companies were confronted with a large volume of insurance on depreciating property values. At the same time there was a decreased interest on the part of policy-holders in avoiding losses. In many cases it became profitable to collect insurance rather than to preserve the values insured.

In certain lines the increased volume of business and apparent prosperity of insurers led to the organization of many new companies and the introduction of inexperienced personnel. Subsequent events tested these new organizations and in many cases caused their disappearance.

The extreme depreciation of securities might have caused

serious problems for companies which carried large amounts of invested funds over considerable periods of time had not insurance officials applied new standards which took into account the intrinsic worth rather than the market price of the securities.

At the beginning of the war considerable direct insurance and reinsurance was carried by the American branches of alien enemy companies. Even after the entry of the United States into the war these companies were permitted to write business. It soon became evident that their activities must be checked, largely because their operations enabled them to acquire and convey to the enemy vital commercial information. At the end of 1917 these companies ceased writing new business and were taken over by the Alien Property Custodian. This change necessitated a new distribution of insurance in the American market and resulted in an increase in business for American companies and for those of friendly nations.

*Coöperation of Insurance Carriers.*—The years 1910–21 showed a remarkable increase in the acceptance of the principle of coöperation among insurance carriers. Problems involved in the control of new lines of business, in the meeting of new conditions in old lines, and in general the recognition of common interests by insurance executives all have contributed to the growth of coöperative organizations. These organizations have as their chief purposes education of the public, control of legislation, making of premium rates, adoption of uniform contracts, discouragement of bad practices, provision of reinsurance facilities, suppression of fraud. All this is a part of the growing recognition that the business can no longer proceed along the old individualistic lines.

*Governmental Regulation.*—During 1910–21 there were also notable advances in the regulation of insurance in the interest of the public. Perhaps the most significant is the growth in importance of the National Convention of Insurance Commissioners, an organization of regulatory officials from the various states in the interest of promoting sound and uniform methods of regulation. Discussions at the meetings of the Convention, and the work of its several committees, each of which deals with some one aspect of the insurance problem, have served to improve the quality of state regulation and to increase the respect with which state departments are regarded by state Legislatures, as well as insurance executives and the public. Among specific accomplishments in the general field of regulation may be mentioned: coöperation in the examination of insurance companies, the uniform valuation of securities for insurance purposes, regulation of the appointment and practices of agents and brokers, prohibition of discriminatory acts, and the adoption of uniform standards of practice.

*Insurance Education.*—There has been a marked increase of interest in insurance education. Some universities have departments of insurance with classes for college students and for men engaged in the business, and many other colleges and universities have devoted some attention to this subject. The Insurance Institute of America and its constituent societies have developed education among employees of the companies. The Casualty Actuarial Society was organized in 1914 for the purpose of furthering scientific research and education in casualty subjects.

*United States Chamber of Commerce.*—Recognition of insurance as an independent business activity of major importance was evidenced in the creation of an Insurance Department in the organization of the United States Chamber of Commerce.

*Expansion of Operations Abroad.*—In 1918 the American Foreign Insurance Association was organized to transact fire, marine and allied branches of insurance in all parts of the world with the exception of North America. The association was in 1921 composed of 16 leading American companies and had an extensive system of branches and agencies.

### *Life Insurance*

*Extent.*—In 1921 life insurance still held its place as financially the most important type of insurance with assets of 253 companies at the end of 1920, as given in the Insurance Year Book, of nearly $7,400,000,000, a total income during 1920 of nearly $1,800,000,000, and disbursements of over $1,200,000,000. These figures represent a growth of over 100% since 1909 when the same items for 189 companies were, respectively, about $3,500,000,000, $750,000,000, and $500,000,000. Consideration of the reports of companies subject to the jurisdiction of the New York Insurance Department shows that the increase of business during the 10 years was somewhat irregular. The total number of policies in force increased from slightly over 5,750,000 on Dec. 31 1909 to nearly 14,000,000 on Dec. 31 1920; insurance represented by these policies from over $11,000,000,000 to nearly $27,000,000,000. At the same time the size of the average policy increased from $1,930 to $2,055. There were substantial increases in the amount of new business written in each of the years 1910 to 1913 inclusive, a slight decrease in 1914, further increases in 1915 to 1918 inclusive, and an immense increase in 1919 which was exceeded in 1920. The amount of new business written in 1920 was more than five times the amount written in 1910. Practically all this new business represented an increase in the business of old companies. At the beginning of the period there were 35 companies operating in New York and at the end 37. In the whole United States the number of companies operating increased in the same period from 189 to 253, but nearly 85% of the business was carried by companies operating in the state of New York.

It is impossible accurately to assess the importance of each of the various reasons for the immense increase in the life-insurance business. The following are probably the principal causes: (1) Inflation and high prices, making necessary a larger amount of insurance to achieve the same real protection. (2) Increased willingness to pay for insurance out of high wages and profits due to the war. (3) Education in the desirability of life insurance through widespread application of the governmental war-risk scheme. (4) Development of life insurance to cover business risks, inheritance taxes, and other contingencies.

One result of the Armstrong Investigation of 1906 was an attempt to limit the new business which individual companies might write in any one year. The impracticability of the limitations originally imposed soon became evident and modifications in the law caused their almost complete elimination.

The following table from the *Insurance Year Book* presents in detail the record for 1910–20 of new business written and insurance in force for companies reporting to the New York Insurance Department:—

| | No. of Companies | New Business Written | No. of Policies in Force Dec. 31 | Amount of Insurance in Force Dec. 31 | Amount of Average Policy |
|---|---|---|---|---|---|
| 1910 | 33 | $1,362,589,920 | 6,049,617 | $11,669,698,842 | $1,929 |
| 1911 | 34 | 1,577,846,251 | 6,621,386 | 12,802,989,205 | 1,934 |
| 1912 | 34 | 1,702,146,572 | 7,002,352 | 13,527,321,222 | 1,932 |
| 1913 | 34 | 1,840,577,945 | 7,452,154 | 14,324,485,296 | 1,922 |
| 1914 | 35 | 1,808,730,481 | 7,851,199 | 14,931,150,898 | 1,902 |
| 1915 | 35 | 1,928,288,981 | 8,284,281 | 15,609,722,445 | 1,884 |
| 1916 | 35 | 2,362,193,027 | 8,886,568 | 16,784,207,636 | 1,889 |
| 1917 | 35 | 2,879,338,785 | 9,502,382 | 18,422,349,562 | 1,938 |
| 1918 | 37 | 2,979,783,022 | 10,193,211 | 20,018,199,440 | 1,963 |
| 1919 | 37 | 5,213,897,389 | 11,602,715 | 23,849,488,761 | 2,050 |
| 1920 | 37 | 5,628,778,503 | 13,199,605 | 26,839,537,511 | 2,055 |

*Mortality.*—The registration area of the United States showed a decrease in general mortality from 14·7 per thousand to 12·8 per thousand for the years 1910 to 1919 inclusive. Investigations of mortality of insured lives showed a similar trend. This favourable mortality experience was interrupted by the influenza epidemic. It was at its height during the winter of 1918–9, resulting in such an increase of deaths that the mortality of insured lives reached approximately 100% of the American Experience Table, although normally it is expected to reach only about 55 to 75% of that table according to the age of the company. A well-known actuary has said that the net effect on the general body of policy-holders in participating companies was the loss of approximately one year's dividends. Fortunately the epidemic was brought under control and no insurance company was unable to meet its liabilities to policy-holders on account of it. A few small companies were seriously embarrassed and some were forced to reinsure; but the large old-line companies, although they found it necessary to reduce dividends in some cases, were at no time in danger of becoming unable to meet their obligations.

*Mutualization.*—In the years 1910–21 the Metropolitan Life Insurance Co. and the Home Life Insurance Co. passed from the stock form of organization to the mutual. The Equitable Life Assurance Society and the Prudential Life Insurance Co. practically did so although they were in 1921 still technically stock companies. With these changes the mutual form of organization became the ruling force in life insurance, nearly all of the large companies in 1921 being operated on the mutual plan. A large majority of the smaller companies were stock corporations.

*Group Insurance.*—Group insurance has as its purpose the insurance of the lives of a group of employees under a blanket contract issued to the employer who becomes responsible for the payment of premiums although he may arrange for contributions from his employees. The New York Insurance Department issued its first approval of a policy of this form in Feb. 1911. On Dec. 31 1920, according to the *Insurance Year Book*, there were nearly 19,000 policies and over $1,500,000,000 of insurance in force under this plan. Although 31 companies had group insurance on their books, 4 of these wrote about 90% of the total business. In its typical form this insurance is written under a yearly renewable term contract at a premium rate based on the age-characteristics of the group at the time of writing the contract and on the desirability of the group as an insurance risk. The individual amounts payable to the beneficiaries of the employees are small, varying from $500 each to a maximum of $5,000. This type of insurance is becoming an accepted form for large industrial corporations.

*Disability Clause.*—The disability clause commonly added to the insurance contract provides for the assumption by the life insurance company of the risk that the insured might become totally and permanently disabled. In its most complete form it provides for a waiver of premiums during the period of disability, maintaining the amount of insurance unimpaired, and for the payment of an annuity to the policy-holder. In its early form the clause provided for waiver of premiums alone, but it gradually has been liberalized as experience and the demand for protection have developed. A recent development is a provision to the effect that after a policy-holder has been totally disabled for three months it shall be presumed that he is likewise permanently disabled. Another development in liberality is the practice of granting benefits after death which might have been claimed under this clause by the insured during his lifetime.

Tuberculosis, insanity, and accidents account for the majority of cases of permanent and total disability. Mr. Arthur Hunter in a paper delivered before the Actuarial Society of America presented the following figures covering the experience of the New York Life Insurance Co. from 1910 to 1920:—

| Cause of Disability | Number of Cases | Per cent of Total Claims |
|---|---|---|
| Tuberculosis | 730 | 43·7% |
| Insanity | 334 | 20 |
| Accident | 106 | 6·3 |
| Paralysis of all forms including infantile | 77 | 4·6 |
| Cancers and tumours | 58 | 3·5 |
| Heart disease | 51 | 3·1 |
| Other causes | 314 | 18·8 |
| Total | 1,670 | 100·0% |

*Double Indemnity.*—The so-called double-indemnity clause which has come into general use in life policies takes two forms: one promising a payment of double the amount of insurance in the event of death from any accidental cause; the other promising double payment if accidental death occurs while the insured is a passenger on a common carrier. A small extra premium is usually charged for this feature. This coverage has developed largely as a selling point and it seems to many to have no logical place in a life-insurance contract.

*Mortality Investigations.*—In 1916 the Bureau of the Census published an interesting set of mortality tables known as the United States Life Tables, 1910. These were based on the general mortality statistics for the original registration states and showed mortality for males and females, whites and negroes, natives and foreign born, and dwellers in city and country. There were also special tables for the states of Indiana, Massachusetts, Michigan, New Jersey, and New York. The Medico-Actuarial Mortality Investigation was completed and published in 5 volumes. This investigation was undertaken jointly by the Association of Life Insurance Medical Directors and the Actuarial Society of America. To quote Mr. Wendell M. Strong (*American Year Book*, 1913, p. 369): . . . "The present investigation is of even greater scope than the Specialized Investigation and is participated in by 43 companies of the United States and Canada, including practically all of the important companies of both countries . . . the scope of the investigation will be seen from an enumeration of a few of the subjects and classes investigated, such as weight with reference to height and age, causes of death, over-weights, under-weights, large men, small men, married women, unmarried women, family history of tuberculosis, different classes of miners, different classes of employees in the iron business, and different races."

It has long been recognized that the American Experience Table of Mortality is not an accurate statement of insurance experience, particularly as to the younger ages. In 1915 the Actuarial Society of America, at the suggestion of the National Convention of Insurance Commissioners, undertook to prepare a new American table. The result of the work, which was participated in by these two organizations and by the American Institute of Actuaries, was issued in the form of two principal tables: the American Men Table, and the Canadian Men Table, of which the former is the more important. These tables are based on the combined experience of 60 leading insurance companies of the United States and Canada. The results show, for ages below 50, a considerably lower mortality than that indicated by the American Experience Table, while mortality rates above 50 are approximately the same.

*Governmental Insurance.*—Two states have experimented with state-managed life insurance, each contemplating principally the elimination of the agent's commission. The Massachusetts Savings Bank Insurance scheme, which was started in 1907, showed Oct. 31 1919 total insurance in force of $12,374,000. The Wisconsin State Life Fund, which was started in 1912, showed insurance in force Dec. 31 1919 of $404,000. The most important governmental attempt to furnish life insurance during the period was of course the War Risk Insurance Bureau, described under PENSION.

*Industrial Insurance.*—Industrial insurance showed a steady growth during the period, as indicated by the following table from the *Insurance Year Book:*—

| | No. of Companies | Insurance Written | Insurance in Force (as of Dec. 31) | |
|---|---|---|---|---|
| | | | No. of Policies | Amount |
| 1910 | 22 | $ 749,717,264 | 23,044,162 | $3,179,489,541 |
| 1915 | 25 | 999,079,322 | 33,370,638 | 4,431,754,866 |
| 1920 | 20 | 1,545,989,192 | 49,178,887 | 7,121,380,255 |

*Fraternal Insurance.*—The development of fraternal insurance, so far as figures are available, is shown in the next table from the *Insurance Year Book:*—

| | No. of Orders | Insurance Written | Insurance in Force (as of Dec. 31) | |
|---|---|---|---|---|
| | | | No. of Certificates | Amount |
| 1910 | 497 | $1,331,552,713 | 8,558,093 | $9,562,511,910 |
| 1911 | 396 | 1,200,633,063 | 10,122,169 | 9,839,909,282 |
| 1912 | 397 | 1,023,726,087 | 9,963,019 | 9,472,232,473 |
| 1913 | 509 | 1,065,071,108 | 8,058,317 | 9,622,276,590 |
| 1914 | 498 | 1,079,569,596 | 7,868,554 | 9,171,284,227 |
| 1915 | 472 | 922,890,799 | 7,695,944 | 8,694,449,483 |
| 1916 | 523 | 1,155,784,564 | 8,674,996 | 9,162,111,616 |
| 1917 | 533 | 822,041,734 | 7,456,551 | 9,129,974,447 |
| 1918 | 506 | 834,170,063 | 8,021,387 | 8,838,578,765 |
| 1919 | 463 | 1,327,957,612 | 10,380,132 | 9,531,216,614 |
| 1920 | *238 | 1,177,970,840 | 8,439,097 | 8,879,451,774 |

*Orders showing 1920 figures.

An improvement in the conditions of fraternal insurance, most important from the point of view of the insured, was brought about by the Mobile Bill and the New York Conference Bill. The former was the result of a meeting of the National Convention of Insurance Commissioners and representatives of the fraternal organizations held in Mobile, Ala., in Sept. 1910. It was enacted into law or adopted by departmental rulings in many states without material amendments and required the societies gradually to improve their condition under state supervision until they should reach a defined standard of solvency. The latter bill which has since been generally adopted is in the nature of an amendment to the Mobile Bill and is an improvement on it in some respects. Through legislative permission the fraternal societies have also acquired the power to write juvenile insurance.

### *Fire and Marine Insurance*

The development of fire and marine insurance during the years 1910–20 is indicated by the appended table from the *Insurance Year Book.*

It must be remembered in considering these figures that the 1920 statements do not reflect completely the process of deflation of business, as the figures for 1921 were not available when this article was written.

It is unfortunate that aggregates are not available separately for fire, marine and allied lines of insurance. The figures here given represent all lines written by companies doing primarily fire and marine business.

*Fire and Marine Insurance, 1910–20.*

| | No. of Insuring Organizations | Net Premiums | Total Income | Paid for Losses | Paid for Expenses | Total Disbursements |
|---|---|---|---|---|---|---|
| 1910 | 624 | $ 267,134,029 | $ 295,644,715 | $125,335,702 | $ 95,466,763 | $256,681,453 |

*Fire Losses and their Prevention.*—The annual fire losses in the United States during 1910–20 as compiled from various sources by the Spectator Co. show a fluctuating tendency due probably to their relation to the changing business situation. It will be noted that for the year 1920 there is an unusually high figure.

*Fire Losses in the United States, 1910–20.*
(From the *Insurance Year Book.*)

| | Aggregate Property Losses | No. Fires Causing Loss of $1,000,000 or More |
|---|---|---|
| 1910 | $214,003,300 | 13 |
| 1911 | 217,004,575 | 12 |
| 1912 | 206,438,900 | 8 |
| 1913 | 203,763,550 | 6 |
| 1914 | 221,439,350 | 9 |
| 1915 | 172,063,200 | 10 |
| 1916 | 214,530,995 | 13 |
| 1917 | 250,753,640 | 22 |
| 1918 | 290,959,885 | 21 |
| 1919 | 245,793,128 | 28 |
| 1920 | 303,147,351 | 13 |
| | $2,539,897,874 | 155 |

During 1910–20 there were 10 fires involving losses of $5,000,000 or more each, 5 of which caused losses of over $10,000,000 each. Certain of these fires were caused in part at least by explosion.

The insurance experience of the 10 years was very favourable as there was only one year, 1914, during which the ratio of insurance losses to premiums exceeded the average ratio of the past 61 years. This ratio touched its high point in 1914 at approximately 60% and its low point in 1919 at approximately 40%. The ratio was rising during 1920 and 1921.

In 1915 the Actuarial Bureau of the National Board of Fire Underwriters was founded in response to a demand for complete classified statistics of fire insurance experience. To 1921 this work had been devoted almost entirely to the classification of losses by states and by causes and a report had been issued on this subject covering the years 1915–19 inclusive. The following table is a condensation of this report:—

| | Amount of Losses | Per cent of total |
|---|---|---|
| Strictly Preventable Causes . | $287,759,960 | 25 |
| Partly Preventable Causes . | 484,753,172 | 43 |
| Unknown Causes . . . | 360,587,544 | 32 |
| Total . . . . . | $1,133,100,676 | 100 |

Little was done in the development of entirely new fire-prevention devices. There was considerable improvement in the efficiency of operation of devices which were already in use in 1910, and there was a widespread development of education and stimulation of fire prevention. In 1920 the President of the United States issued a proclamation setting aside Oct. 9 as fire-prevention day. Education in fire prevention was extended to the schools and a large amount of literature was distributed. Results from this work had not yet become perceptible during 1921, though future years were confidently expected to show a reduction of losses. During the war important industrial and governmental property was put under the care of fire-prevention engineers. The results furnished abundant evidence of the effectiveness of preventive measures when directed by experts.

*Fire Insurance Rating.*—Little fundamental progress was made in the development of fire-insurance rating. Modifications of the Universal Mercantile Schedule and the Dean Schedule still were used throughout the country in 1921. The latter had been adopted in new localities, notably in New England and the Middle West, and was used in 29 states. Interesting proposals for improvement of the rating situation were offered in the Experience Grading and Rating Schedule and the L. and L. Schedule, both of which failed to be adopted. The former contemplates a revolutionary change of methods of rating. It is a plan for collecting statistics on fire-insurance experience in such a way that relative hazards may be calculated and premium rates based upon them. The L. and L. Schedule does not differ in principle from the older type.

Several states have passed laws dealing with fire insurance rates, varying all the way from the prohibition of discrimination to the creation of a special rating board for the purpose of making rates. Better opinion seems to favour a type of law which permits the making of rates by insurance carriers acting in concert and subjects the rate-making organization to supervision. Several important reports on investigations dealing primarily with fire insurance were made during the period, resulting in advances in state regulation and in curbing undesirable practices. The most significant of these was the Merritt Report transmitted to the Legislature of New York in 1911. Others were the Illinois Report of 1914, the Pennsylvania Report of 1915, the Missouri Report of 1914, and the North Carolina Report of 1914.

*Anti-Compact Laws.*—Attempts have been made in certain states to prevent all forms of coöperation between insurance companies in fixing premium rates. In the states of Missouri, South Carolina, and Mississippi such attempts resulted in the virtual withdrawal of the companies. Compromises were effected in the first two states and the objectionable legislation withdrawn; the situation in Mississippi was still unsettled in 1921. Such destructive methods are evidence of a poverty of constructive ability to deal with insurance problems. They cause confusion in business and retard the adoption of more adequate measures.

*Underwriting Profit.*—The conflict of opinions concerning what constitutes a reasonable underwriting profit for fire insurance companies was resolved in some measure by the agreement between the National Convention of Insurance Commissioners and the National Board of Fire Underwriters. The following points of agreement were reported by the latter body in the Proceedings of its 55th Annual Meeting:

"1. The minimum 'reasonable' underwriting profit is 5% plus 3% additional for conflagrations.

"2. Five years is a minimum term upon which to base a calculation as to underwriting profits.

"3. The difference between earned premiums and incurred losses, plus incurred expenses, represents underwriting profit or loss.

"4. A conflagration is defined as property loss exceeding $1,000,000.

"5. In determining the underwriting experience in any given state the first $1,000,000 of loss shall be charged to the particular state and the balance distributed among all the states (including the one in which it occurred) in proportion to the premium income of each.

"6. That no part of the so-called 'banking' profit shall be included in the underwriting profit."

It is to be noted that the term "underwriting profit" is defined by this agreement as signifying a profit drawn entirely from the operation of the insurance business as such and that there is eliminated from consideration any profits which a fire-insurance carrier may make from invested funds. Dividends to stockholders are in many cases paid from the latter source, insurance profits going entirely to increase surplus.

*Revision of Standard Policy.*—The old New York Standard Policy which was in use in many parts of the United States was supplanted in New York on Jan. 1 1918 by a new policy form. The new form differed in detail and in arrangement from the old and gave effect to the changes which some 30 years' experiences had shown to be desirable. Substantially the same policy had been enacted in Pennsylvania in 1915. The new policy had been approved by the National Convention of Insurance Commissioners and was in effect in 1921 practically throughout the United States.

*Marine Insurance.*—The only figures indicating the extent of the marine insurance business in the United States are those which were compiled by Dr. S. S. Huebner of Philadelphia in connexion with an investigation of marine insurance described below. These show that the total net premiums received during the year 1918 by American companies amounted to over $70,000,000 and by foreign companies to over $39,000,000, a total of $109,000,000. Estimated losses paid were respectively $40,000,000 and $24,000,000, a total of $64,000,000. These figures take no account of the large amount of marine insurance which is placed directly with the home offices of foreign companies, of which no record appears in the American reports. It is variously estimated that premiums for this business aggregate 20% to 30% of the total for the United States.

*The War and Marine Insurance.*—Marine insurance was more intimately connected with the conduct of the World War than was any other line, since it dealt with hazards involved in shipping supplies to Europe. As evidence of the increase of interest in the business during the war, the N. Y. Insurance Department reports that, while there were but 58 organizations authorized to write marine insurance in New York on Jan. 1 1914, there were 109 so authorized on Jan. 1 1918. This total includes new companies organized during the period as well as old companies extending their facilities. So great, however, were the risks incident to war that it was impossible for private initiative to cope with them. Accordingly the Government established the Bureau of War Risk Insurance, which accepted insurance against war hazards. This Bureau was a necessity during the continuance of hostilities; without it American commerce must have almost ceased. Its operations had by 1921 been discontinued so far as they related to marine insurance. New private organizations were attracted into the field by the seemingly large profits, but lack of experience and reckless underwriting caused the disappearance later of some of these organizations and the withdrawal from the marine business of many of the companies primarily interested in fire insurance. Losses which were apparently small during the war period in their final settlement turned out to be alarmingly large. In addition there was an increase in the moral hazard after the war, due to depreciation of values and to the tendency on the part of foreign merchants to refuse to accept shipments of goods whenever a pretext could be found. Congestion of ports in the artificially prosperous times succeeding the Armistice was another cause contributing to increased losses.

During this period, owing largely to the competition of new underwriters, the marine insurance contract was quite generally extended

to cover the risk of theft and pilferage. Experience under this coverage has been most unfavourable, as the existence of insurance tended to relieve shippers and carriers of concern for the safety of the cargo. This, with the moral irresponsibility engendered by the war, demonstrated the need of restricting or eliminating the coverage. When accepted it is now frequently provided by indorsement that only 75% of theft or pilferage losses will be paid.

*Congressional Investigation.*—In 1919 the Committee on the Merchant Marine and Fisheries of the House of Representatives and the U.S. Shipping Board entered upon an investigation of marine insurance in the United States. It early appeared that what the committee regarded as an unduly large share of American marine insurance business was placed directly or indirectly with foreign companies. On the ground that American marine insurance facilities should be developed to a point which would enable American companies to care for the commercial needs of the United States, the committee recommended that combinations of companies be legally authorized, and that the legislative obstructions, including taxation, which hamper companies in their competition with alien interests, should be removed. To provide increased facilities for hull insurance and the survey of losses, three marine insurance syndicates were organized with the approval and encouragement of the Congressional Committee. Syndicate "A," which is a service syndicate for the settlement of losses, operates through the United States Salvage Association, Incorporated. There was likewise introduced a marine-insurance bill for the District of Columbia, designed to serve as a model for enactment in the states.

*Marine-Insurance Contract.*—In 1917-8-9 the American Hull Underwriters Association adopted certain new forms of marine-insurance contracts which have come into general use, not differing widely from the old forms but adapting them to American conditions.

*American Bureau of Shipping.*—Increased activity in extending the operations of the American Bureau of Shipping has placed at the disposal of American marine underwriters improved facilities for the classification of risks.

### *Casualty and Miscellaneous*

*Workmen's Compensation.*—The substitution of the principle of workmen's compensation for that of employer's liability in the United States (*see* LABOUR LEGISLATION) gave rise to an entirely new form of insurance by which insurance carriers assume the obligation of employers to pay compensation to their workmen. Workmen's compensation insurance occupies a peculiar place. The insurance carrier is placed in the position of an administrative unit in a scheme of social welfare. Its duties involve relieving employers of undue risk, insuring the payment of compensation to employees, and assisting in the prevention of industrial accidents. In this form of insurance also there are found the only examples in the United States of the extensive application of state-managed insurance. In 6 states the so-called state funds are given a monopoly of workmen's compensation insurance, in one state there is practically a monopoly, and in 9 states the state fund competes with private carriers. The growth of this type of insurance followed the increasing acceptance of the compensation principle, until in 1920 the carriers collected some $200,000,000 in premiums, more than twice the amount of the entire premiums paid for all kinds of casualty insurance in 1910. It was by far the most important of the lines of insurance written by casualty companies.

Workmen's compensation insurance is written largely by stock-insurance companies, but the organization of state funds, mutuals, and reciprocals has intensified competition for the business. Fortunately competition is in large measure regulated by coöperative action and state regulation, so that it had not the disastrous effects which might otherwise have developed. It undoubtedly improved the service offered to policy-holders.

Regulation of premium rates by the state was from the first an important factor in the compensation business, which is held to be affected with a greater public interest than are most other types of insurance. At first this regulation took the form of approval of rates as to adequacy, with the purpose of requiring carriers to collect sufficient premiums so that there might be no question of their ability to pay claims to injured workmen. Largely through the operation of competition, approval as to adequacy has involved approval as to reasonableness since rates charged in individual cases tend to be the lowest permissible. The measurement of the hazard of workmen's compensation insurance as expressed in terms of rates is peculiarly difficult. In the first instance the carriers had no experience of immediate value. Even after experience was acquired it was difficult to make use of it, because of the great variation in laws and conditions among the states and because of the frequent changes in the laws of each state. Further, each industry and each plant should be rated on its peculiar hazards.

The first rates, which were largely a matter of judgment, were too high. Successive reduction and changes in conditions brought about a rate-level which in 1916 was seen to be too low. The state departments of insurance and the carriers realized the necessity of revising rates and of securing the widest possible basis of experience for the revision. Compensation rates for the entire country were revised in 1917 by the Augmented Standing Committee, a group representing all interests: companies, mutual companies, state funds, and state departments of insurance. The success of this conference led to the formation in 1918 of a continuing coöperative organization, representative of the same general interests. This organization, the National Council on Workmen's Compensation Insurance, conducted another general revision of rates in 1920. These rates, with certain detailed changes, were in effect in 1921. In addition to the national organizations, there were many state rating bureaus which have control over the making and application of rates in their respective states. All but one of these organizations cooperated with the National Council. Where exclusive state funds are in operation each state is, of course, a unit.

The rates of premium developed in the first instance were average rates for each industry. Further account must be taken of the variation from the average of individual plants within the industry. This is accomplished through the application of a system of merit rating, consideration being given in most cases to the loss experience of the individual plant and to the hazards of the plant as determined by inspection of its physical features. Provision is made in compensation acts for the payment of compensation in periodical installments. An insurance loss under a compensation policy may involve payments extending over a considerable length of time. To guarantee the ability of the carrier to make such payments it is necessary that a reserve be set up which shall be equivalent to their probable amount. Such reserves are required by state law, and the rules for their calculation have gradually been improved so that there was in 1921 little question of their adequacy.

*Automobile Insurance* established itself during the years 1910-21 as a major department of the business. Net premiums received during 1920 were estimated by *The Insurance Field* at $185,000,000. Full coverage under automobile policies involves several hazards, contracts being written to cover the risk of fire, theft, damage to the insured's automobile through collision, liability for damage to the property of others, and liability for personal injury. Fire and theft insurance are written by fire and marine companies, personal liability by casualty companies, while collision and property-damage insurance are written by both. In the West and South there are many specialized automobile insurance companies writing all forms of coverage. Combination contracts are frequently issued by a fire and marine company and a casualty company under a coöperative arrangement. The contract of each company is, however, independent.

The rapid development of this sort of insurance has carried with it serious problems, particularly in the fields of theft and collision where the moral hazard is peculiarly difficult to handle. Rates for these coverages are high, and losses so serious that in 1921 it was apparent that some means must be found to control the hazard. Both casualty companies and fire and marine companies had their separate organizations for discussion and for taking coöperative action on automobile problems. The two organizations coöperate closely in matters of common concern. In this way the contract and rating methods have gradually been developed. It seems probable that the loss problem will receive increasingly effective attention from these same organizations.

*Accident and Health Insurance.*—Premiums of approximately $92,000,000 were received for accident and health insurance in 1920. This was about three times the premiums of 1910, representing largely an increase in the business of casualty companies, although certain life-insurance companies have developed this field recently. Two new forms of contract appeared which are of particular interest. Accident and health insurance contracts may now be secured without provision for cancellation by the insurance company. Formerly contracts were written only on a one-year basis with provision for cancellation at any time by the insurer, and the bulk of the business was in 1921 still so written. It was the practice of the companies to cancel as soon as there was any evidence of a risk becoming undesirable; consequently, many individuals needing this type of insurance were unable to secure it. The new form insures the continuance of the coverage. Another recent development is group accident and health insurance, similar in its purposes and methods to group life insurance, described in a preceding paragraph. It is being used in many cases as supplemental to the limited coverage provided by workmen's compensation laws which apply only to occupational accidents. Many of the states have enacted standard provisions to be incorporated in policies, some of them compulsory and some optional. These laws have introduced an element of standardization into the contract but the schedules of benefits still remain bewilderingly diverse.

*Other Lines.*—During the years 1910-20 there were tremendous increases in the business of bonding and of plate glass, burglary and theft, and flywheel insurance. There were considerable increases in steam boiler, title, credit, and live stock, and a decrease in workmen's collective and employer's liability insurance.

Several new types of insurance appeared and attained positions of more or less importance. Among these are strike insurance, covering loss of profit and expenses due to strikes of employees; aviation insurance, covering hazards connected with the use of aeroplanes; weather insurance, covering loss due to interference by rain with public ceremonies, amusements, sales and other events; explosion insurance; crop insurance, covering the failure of crops to reach the marketable stage; riot and civil commotion insurance; and parcel post insurance, covering losses of parcels sent by mail. (R. H. B.)

**INTELLIGENCE, MILITARY.**—Under this generally accepted designation may be considered the work of obtaining, collating and interpreting information about an enemy or potential enemy, and also the results of that work and the organization which performs it. In practice, "negative" or "defensive" intelligence, that is the countering of an enemy's efforts to obtain intelligence, is also included, as explained below.

(A.) *Intelligence Generally.*—Up to the last few years before the World War the function of military intelligence was in no way separated from staff work in general, nor regarded as a specialty. Information as to actual or potential enemies has of course always been required, obtained and interpreted by Governments and commanders in the field, and individual officers have won great distinction in the wars of the past in obtaining news of vital importance. The employment of spies and the questioning of prisoners date from the earliest times of military history. But such military intelligence was casual and *ad hoc* rather than systematic. Even in Napoleon's day the secret service of his empire was controlled by the Foreign Office in Paris, whose information sometimes took weeks to reach the army in the field. The more immediately useful information furnished by local agents in the theatre of war was indeed organized and paid for within the army, and then, as now, it was the duty of every subordinate commander to collect all possible information and pass it to his superior. But of a regular intelligence service as understood to-day there was no trace in Napoleon's armies. The collection of information was the duty of soldiers generally and the profession of spies habitual or temporary, and its synthesis and interpretation were, in practice, the business of the commander-in-chief himself aided by those of his staff officers whom he chose to employ. Later, we find from time to time "intelligence corps" formed for the obtaining of information, but it still remains part of the functions of a staff—and, when specialized, a general staff—to collate and to interpret this information. Nevertheless, the very organization of such corps or agencies for collecting information implies that it is the business of some one, in charge of the corps or employing the agents, to receive the information that is obtained item by item and to collate it, as well as to direct the efforts of his corps or his agents to those localities where, or to those subjects on which, special information (positive or negative) is wanted by the commander.

In this sense Napoleon was served by an intelligence officer of the first class—Col. Bacler d'Albe, unknown to fame save as a cartographer, but in fact the one assistant who was present when Napoleon arrived at his great decisions in the field. Lying prone on the outspread maps, compasses in hand, with D'Albe at his elbow to inform him either as to topography or as to the enemy's dispositions and order of battle,[1] Napoleon could handle a changing situation day by day with all the certainty that the means of communication of his day allowed. It has recently been remarked that, to a Napoleon, an intelligence staff is more indispensable than the operations staff, and the remark is historically justified by the facts. For an operations staff is the product of a military system—that of Germany—in which the commander-in-chief is a sovereign who may not possess the qualities of command but yet must command, and it has developed because the growing intricacy of operations detail has compelled an increase in the number of workers who collaborate with the normal commander-in-chief. A saying of Foch is illuminating in this connexion. The great French marshal, asked how Napoleon would conduct the western front campaigns, replied: "Were he to return he would say 'you have weapons, numbers, communications, aircraft, transport such as I never possessed. Stand aside, all of you, and I will show you.' But, now as then, he would have taken care to have his Bacler d'Albe at his side."

In so intimate a union between the master of operations and the intelligence officer, it may be assumed without direct evidence that a man whose military judgment was matured by the unique experience of watching Napoleon's brain arrive at conclusions, and following his thoughts so as to be ready to supply the data on which they fed, must have added the function of "interpretation" to those of collection and sifting.

In this word "interpretation" we reach the real *differentia* between the ordinary system of military intelligence work in the past and that developed in the World War.

Napoleon was his own operations staff, and Bacler d'Albe, in his own person also, was the intelligence staff. But while, as above mentioned, the operations work of a Napoleon came, in the middle of the 19th century, to be devolved upon an organ known as the general staff—there was no collateral development on the intelligence side. It is true that within the general staff a branch was usually set apart for intelligence work, and that such organizations of secret agents as existed were controlled by the general staff. Moreover, the study of foreign languages came to be regarded as a valuable element in a staff officer's equipment. But these things did not amount to providing the command (or the operations staff, which is often the command in commission) with the organ which should play Bacler d'Albe to their Napoleon. France, with its "Deuxième Bureau," came probably as near to that ideal as any country, but the Deuxième Bureau was discredited and shaken to its foundations by the Dreyfus affair. Moreover, a new doctrine of the relations between operations and intelligence, to be discussed presently, was set up about 1912, which tended to impair its usefulness still further. In Great Britain the reorganization following upon the Esher report in 1904 provided that the directorate of operations on the general staff should deal, section by section, with intelligence and operations together; thus, the section charged with preparing plans of operations against, say, Turkey was responsible for all intelligence concerning Turkey. In the field organization, both before and during the World War, sufficient officers were allowed on the staff of each formation for one to devote himself principally to intelligence work, and at G.H.Q. there was provided a "brigadier-general intelligence" coequal with a "brigadier-general operations." But any real specialization of function which grew up in the war was due rather to the immense and unforeseen volume and complexity of the information to be handled than to any change of doctrine. If, in the higher staffs, officers were engaged on intelligence work to the exclusion of every other activity, on the lower staffs it was not so. To the very end of the war the theory that, in a division, a G.S.O. 3rd grade (Intelligence) was the understudy of the G.S.O. 2nd grade (Operations) was rigorously maintained, and an "intelligence officer" so called, who was expected to be nearly as familiar with doings on the German side of the wire as an operations staff officer with those on his own side of it, was looked upon as a technical assistant to the general staff rather than as a member of it. The fact that the subjects on which information was required were immensely extended in the war, did not, and quite logically did not, involve any change of doctrine any more than the appointment of a dozen extra foreign correspondents to a newspaper staff affects the distinction between the news-getting and the editorial functions.

But the inclusion of "interpretation" as a function of the intelligence staff—*de facto* if not *de jure*—marks a difference in kind. Once this is admitted and carried to its logical conclusion, certain officers are told off to live, mentally, in the enemy's camp, to form and to convey to the commander working ideas of the opponent's life, mentality and routine, to vivify the specific facts gleaned by them or by others. An epigram current in the British intelligence service during the war admirably sums up the new rôle:—"The intelligence officer's job is to command the enemy's army."

This is what interpretation implies. The facts have to be given not merely a meaning, but their true meaning, or as near an approximation thereto as possible. It is an old, but frequently misleading, maxim of war that a commander should ask himself what he would do if he were in the enemy's place. The real question is: How will the situation strike the enemy, given his organization, upbringing, habits of mind and predispositions? If, for example, in the third week of Aug. 1914 Hindenburg and

[1] Bacler d'Albe kept a card index of enemy formations and units.

Ludendorff had acted on the supposition that the enemy would do what they in his place would do, Tannenberg would probably never have been fought, or, if fought, would have been merely a battle to gain time. As it was, when pros and cons were practically in equilibrium and the fate of East Prussia depended on the choice made, one thing turned the scale—a conviction derived from intimate knowledge of the Russian army, that in spite of recent reforms and of the evident war-readiness of the enemy, slowness was an inherent character of his leadership. But for this, the decision to leave a mere handful of cavalry in front of Rennenkampf's advancing army, and to concentrate every available rifle and gun against Samsonov, would have been simply trusting to luck, and although luck must always play a part in war, it is the art of command, whether the command be personal or in commission, to reduce this part to a minimum.[1]

To answer the question, then, the commander and his operations assistants must have an intelligence staff which will constantly supply them with a picture of enemy movements, positions and *intentions*. To construct this picture a high degree of military training is necessary, especially in the senior ranks, and the personnel in these ranks must be drawn from the same sources and trained to the same level as similar personnel on the operations staff. But, given this equipment, the intelligence staff officer need have little knowledge of current events and intentions on his own side. The fewer his prepossessions the better.

On this point there has been in the past not a little controversy. In the French command regulations of 1913 it was laid down that the duty of intelligence was to seek for information on the topics and in the directions indicated by the command. In all armies, this principle was accepted so far as cavalry reconnaissance was concerned, the capacities of that arm, and its fragility (exhaustion of horses) made it essential that its activity should be directed to obtaining definite answers to specific questions. The same applies to some extent to information-gathering by other front agencies. And so far as they are concerned the wisdom of the doctrine is unquestionable. In a local tactical situation the presence of enemy forces in certain positions, or their movements in certain directions, can as a rule bear only one meaning. But it is altogether different in the case of groupings and movements of major importance. Here data, even if complete and still more if incomplete, may be wholly misleading unless interpreted by men both qualified in respect of military judgment and also free from preconceived ideas. Instead of placing the intelligence staff in the position of the enemy, with instructions to compile a picture of his grouping and intentions, the doctrine embodied in the French regulations fetters it by compelling it to start from prepossessions. It is to this principally that must be attributed the miscalculations of the French intelligence in Aug. 1914— miscalculations that were nearly fatal to France. It was assumed *a priori* that only first-line troops would be employed by the Germans, and the Deuxième Bureau directed its efforts to identifying the various active army corps as they stood in the strategic deployment. In this it succeeded, but the presence of many duplicate corps of reserves, bearing the same numbers and assembled in the same areas as their parent active corps respectively, passed unnoticed Thus the strength of the enemy's *troupes de choc* came to be estimated on the eve of battle at 40 divisions, whereas in reality there were 68.

When the intelligence staff is regarded as the mirror of the enemy the risk of such miscalculation is minimized. The mirror may be dark at times, and *a priori* reasoning by the command may then be necessary to supplement the picture, but that is a very different matter from drawing a picture for the intelligence staff to fill in. One argument, and one only, in favour of coloured intelligence was and is tempting—the psychological. General Berthelot has admitted that in the information given by French G.H.Q. to subordinate commanders the enemy forces were sometimes deliberately understated so as not to alarm the recipients. Such a proceeding—the risks of which are obvious—is equally conceivable as between an intelligence staff and a command staff. But it is the less likely in proportion as the intelligence staff is allowed to disinterest itself in the events and intentions of its own side. And although it may sometimes be in the general interest that a subordinate's local fears should be overcome by means of a subterfuge, a G.H.Q. must always face the facts. That is the essential quality of its supreme responsibility. Correspondingly, the command is entitled to insist on the facts being presented to it. The intelligence staff need not of course produce at every moment the mass of small items on which its "appreciation" is based, nor should this appreciation be liable to be overruled by a different interpretation of the same evidence on the part of the command (herein its position differs from that of an operations staff). But it cannot expect the "appreciation" to be accepted unless it possesses the confidence of the command, and there is no surer way of forfeiting this than by crying "wolf" too often.[2]

In this modern conception of military intelligence it is evident that the chief of intelligence bears a responsibility that is only less than that of the commander-in-chief or his deputy, the chief of the general staff. The personal rank of the head of the intelligence branch may be high or may be comparatively low, the numerical strength of the organization that he controls may vary from a dozen or two to some thousands—not including "agents" in either case—and the scope of the work may be purely military and local or may cover almost the whole military, political, industrial and economic field as it did in the World War. But whatever his rank, his system and his scope in any particular case, his function is unlike that of any other branch of the staff. He "commands the enemy's army," that is, he interprets to the best of his ability that independent will over which the commander-in-chief exercises no authority.

The collection, sifting and interpretation of data concerning the enemy's resources, movements and intentions constitute what is usually called "offensive" or "positive" intelligence. There is another branch of intelligence work known as "defensive" or "negative" intelligence, but which might more correctly be called counter-intelligence This consists in preventing the enemy from obtaining, or at least from gathering in, the data for his own offensive intelligence. Within its scope fall, besides the obvious task of detecting spies, preventive measures of various kinds such as the enforcement of discretion within one's own army, and the registration of aliens' movements. In some cases, as in Great Britain, the convenience of having all secret services handled by a single staff has produced the combination of counter-intelligence work with that part of offensive intelligence which operates by secret means. Collectively, this service is known in the British organization as Intelligence B or I(b), in contradistinction to Intelligence A or I(a) which obtains information openly and collates and interprets all "offensive intelligence" material however obtained.

(B.) *Positive Intelligence.*—The gathering, synthesis and interpretation of intelligence in war are all more difficult than in peace. The work of agents in a belligerent country becomes difficult as well as dangerous. A state at war brings into operation all the mechanism of counter-intelligence, and while the mere collection of facts is perhaps easier because of the predominance and priority of military over other elements in the national life, the transmission of these facts to the intelligence office which counts them is exceedingly difficult. In the field of operations, information at once becomes more plentiful than

[1] As an example of the reverse, the battle of Wörth in 1870 may be quoted. If, in the circumstances described in 28.834, there had been present on the German side any commander or staff officer with an intimate knowledge of the habits of the French army, the battle would never have been fought.

[2] It goes without saying that this confidence can also be forfeited when events show that the enemy's situation has been presented in too unfavourable a light, but the more thoroughly the intelligence staff absorbs the enemy's "atmosphere" the less likely this is to happen, since there are few situations in war in which one side is more confident than the other is anxious; moreover, the less the intelligence staff is exposed to the pressure of its own side's "atmosphere" the less it is likely to make the wish the father of the thought.

trustworthy, and at the same time has to be synthesized in an atmosphere of hurry and high tension, and interpreted, often without waiting for checks and confirmations, for a commander-in-chief who may well hesitate to stake everything on its accuracy. Nevertheless, during the World War the service of military intelligence reached a level of accuracy and usefulness that it had never reached in any previous war. This success was due (*a*) to the rapidity of modern means of communication, (*b*) to the enormous volume of the data obtained, and (*c*) to the rapid development of aviation. These causes taken together both compelled and justified an elaborate organization of the intelligence service both in War Offices and in field armies.

In considering the organization it is better to ignore the distinction between War Office and G.H.Q., and to differentiate, instead, between the *central intelligence* system—of which certain branches and representatives live and work at G.H.Q., others in Allied and neutral countries and the rest at the War Office—and the *field intelligence* system. The central intelligence system in all cases carries out all the processes—collection, synthesis, interpretation—in connexion with the enemy's forces, recruiting and losses, internal condition and *moral*, economic condition, armament and equipment. When there are several important theatres of war, it is also the final focus of information, and interpreting authority, for the enemy's order of battle, and organization, distribution of force to the different theatres, inter-theatre movements, general plan of campaign, military *moral*, quality of troops, characteristics of leaders and tactical methods. It is, further, the authority responsible for passing information derived from one theatre to other theatres so far as it concerns them. To it belong all organs of the secret service and the counter-intelligence service—together known in Great Britain as I(b)—whether working in a theatre of war or not. It is an open question whether counter-intelligence (which lives mentally on its own side of the line) and positive intelligence (which lives on the enemy's) should logically form part of the same organization, but it is clear in any case that all branches of intelligence which employ secret means of news-gathering should belong to one system, which is the central.

To field intelligence, on the other hand, belong essentially the study, within the theatre of war, of enemy *plans*, as revealed by his distribution of force, movements, and front and rear works. If the theatre of war is single, some functions normally "central"—such as *moral*, order of battle, tactical methods—may come within its scope. Indeed there may be campaigns in which field intelligence absorbs central intelligence completely. In the past, with imperfect means of *liaison* between home and headquarters, this was often the case even in European campaigns, while as regards warfare in undeveloped countries it is often so still. But in war on the scale of the World War, in which the front and the rear, the soldier and the citizen, the gunner and the scientist, react upon one another incessantly, it was imperative to organize the intelligence service—effectively, if not formally—on the basis of a central system for the whole and a field system for each theatre. This logical distinction does not mean that central intelligence and field intelligence operate in watertight compartments. Each is indispensable to the other in a dozen ways. For instance, at the very least half of the data used by central intelligence in determining the enemy's battle order are obtained by field intelligence, and central intelligence, through interrogations of *rapatriés* and refugees, contributes essential details to the stock of field intelligence.

*The Central Intelligence System.*—We may now consider the several elements which make up the work of central intelligence.

The enemy's order of battle is the most important of all classes of intelligence. It forms the foundation upon which is based the greater part of intelligence, reasoning and calculation. Once it is established, variations both of organization and of plan can be followed almost day by day. Forming as it does the framework upon which the enemy's units are built up into armies, it is rigidly respected in practice that from the capture of th[illegible]rs it may be not only possible but safe to deduce the [illegible] of a division at A. and incidentally its withdrawal from its previous position at B., even though these soldiers remain silent under questioning. To the layreader it may seem a simple and obvious course for the enemy command to delude intelligence by constant changes in the order of battle. So it is. But such changes seriously impair efficiency, and as a rule "the game is not worth the candle." This was preëminently true of the German army in the World War. Except at certain crises, in which the only possible course was to seize a battalion here and a brigade there and fling it into the fight, the German order of battle was built up in perfectly logical sequence from the original 25 army corps of peace-time, and, once built up, was maintained till the summer of 1918.

The strength, recruiting and losses of the enemy are studied minutely by organs of the central intelligence both in the field and at home. The sources are, amongst others, statistical enquiries in the prisoners' camps or cages, captured documents, agents' reports from the interior of the enemy's country and the demographic and industrial statistics collected both in peace and in war. Strength is measured partly by multiplying average unit and divisional strengths found in establishing and maintaining the enemy's "order of battle," partly by watching the calling-up of recruit classes in the enemy's home territory. Field strength in relation to available man-power is estimated by careful work on economic data, on the munitions legislation of the enemy's country, by reading letters from home found on prisoners and generally by synthesizing and interpreting very miscellaneous data. An estimate of losses of course forms an essential ingredient of strength estimates and this is formed by studying published casualty lists, working on captured returns, and "analysing" prisoners. This statistical examination of prisoners (if these are available in large numbers) is very valuable, as it shows the composition of typical units of the enemy, his system of replacing casualties, and his man-power.

In the study of the enemy's general plan of campaign, his allocation of force to different theatres and his inter-theatre movements, the data are obtained both by organs of the central intelligence and by the intelligence systems in the field; they undergo, as they pass to the central system, a process of gradual synthesis and crystallization. Other data of a collateral kind come from the political and economic intelligence systems, which are, or should be, asked to contribute not mere data (*i.e.* items), but considered interpretations of the political or economic situation. In these, the highest levels of intelligence work, only the head of the service and a few of his closest and most responsible assistants are concerned; its importance can scarcely be exaggerated, and the synthesis must be so sound that the interpretation can bear the anxious cross-examination of the command and the Cabinet.

Intelligence work on enemy armament and equipment differs somewhat from other branches in that it deals with concrete objects rather than with estimates and appreciations, and moreover requires the services of technicians, either as permanent members of intelligence or as consultants. In its nature this work belongs to the central system. Enemy material is of interest as indicating (*a*) the scale and principles upon which the opponent is armed, (*b*) new weapons or apparatus, and modifications of old ones, which may be worth copying and in any case have to be reckoned with, (*c*) the state of the enemy's munition industries with regard to raw materials, with as its corollary the appearance of new industrial processes. In each of these cases—as indeed in all intelligence work—the essence of success is continuous collection of and systematic reporting on varied items. Thus, a new shell used by the enemy may be reconstructed from fragments even before an unexploded specimen is obtained. A new pattern of gun though it uses a familiar shell may betray itself by the number and inclination of grooves engraved in the driving band, by a "shelling connexion" established between the battery position and the point of impact and by other methods. Fuzes—even percussion fuzes—have a story to tell to the expert, and cast-iron projectiles, chlorate explosives, paper machine-gun belts, steel cartridge cases, interest the economist who is studying the enemy's

industrial condition. But the technical expert often needs the resources of a well-equipped proving ground or laboratory to enable him to carry out his examination, while the economist has to consider the items just enumerated in relation to other data not necessarily concrete, such as the enemy's internal and imported supplies of raw material, his manufacturing equipment and his industrial discoveries. But although it will be seen from the above that command intelligence belongs essentially to the central system, the rôle of the forward intelligence officer in collection of data is of prime importance since he alone can educate the soldier to realize the value of the "souvenir" and even of the unconsidered trifle that seems not worth picking up. It must not be forgotten that it is very largely on such things that armament intelligence has to work, guns and apparatus are not captured every day.

*Field Intelligence.*—As the scope of field intelligence, in the narrow sense, there remains the study of enemy plans and of the ground within its own theatre of war. To this the central intelligence system contributes all necessary battle order information synthesized and interpreted; topographical information as up to date as possible; the estimate that it has formed of the enemy's strength: the deductions as to the general intentions of the enemy that it has arrived at from studying his military, economic and political and *moral* conditions; and any technical matters of tactical importance, such as the probability of a new gas being used. But with all these aids, the task of field intelligence remains an exceedingly heavy one. It is concerned with the tactical situation of every part of the front, in detail. Trenches, dugouts, machine-gun emplacements, trench-mortar emplacements, battery positions have to be watched day by day for new work or for signs of evacuation. Rear areas have to be studied to discover the creation or abandonment of dumps, sidings, aerodromes and wireless masts and above all for indications of movement. An accurate picture in detail of the enemy's defence system has to be formed and information obtained to amplify or correct that already on the maps, as the basis of any local attack scheme. And, over and above all this, field intelligence provides, by means of its wire organs, much of the battle order and other material upon which central intelligence builds up its appreciations.

The organization of the field intelligence service, during the war period, was improvised, and suffered from the defects of improvisation. Intelligence staffs were never truly separated from operations staffs, and within the intelligence branch itself there were distinctions of status and prospects between "staff officers" proper and "intelligence officers" which were all the more invidious as staff status was given in very numerous cases to officers engaged in administrative work pure and simple. In the case of the French army, intelligence officers were not even given military titles, being styled "interpreters." But apart from questions of status, the tendency to multiply intelligence staffs at every headquarters was wasteful of personnel and energy, led to much duplication of work and also to unnecessary circulation of the raw material of intelligence. In the lower formations the daily intelligence summary, which dealt with its own side's operations as well as with the enemy's, came to be regarded as an internal *communiqué* or local newspaper, instead of being treated as the raw material which in fact it was. Aeroplane photographs too, which require a special expertise to make them practically useful, were distributed broadcast. Intelligence should, of course, issue the results of its work to every branch and person concerned, but the processes by which it reaches these conclusions, and still more the undigested material on which these processes are set to work, are useless and mostly quite uninteresting to the soldier in the line.

The term *Ground Reconnaissance*, formerly confined to reconnaissance of terrain as against reconnaissance of enemy movements, is now used to denote reconnaissance of any kind carried out by troops on the ground as against that carried out by aircraft. Though the advent and perfection of the aeroplane have revolutionized the art of reconnaissance, the necessity for reconnaissance on the ground has not disappeared, for the aeroplane has its limitations and there is much information which can only be obtained by troops working on the ground. An aeroplane photographic reconnaissance will enable a pictorial view of the country to be got in a short space of time, and these photographs, especially if the country has previously been mapped, will be very valuable; but of such details as the configuration of the ground, the practicability of roads, the depth of streams, the penetrability of woods, the aeroplane photograph will give no information at all, or at best information which can be obtained more certainly by reconnaissance on the ground. Before an attack invaluable information may be and is obtained by air reconnaissance of the positions to be assaulted, but it is still necessary for the forward troops to push out patrols to reconnoitre the ground and for personal reconnaissance to be made by those to whom the actual attack is entrusted, though they will be able to reconnoitre the ground to better purpose and with greater safety from the knowledge that has already been obtained by air reconnaissance.

Reconnaissance differs in its methods in open and position warfare, but in both the principles are the same. It has two objects: to prevent the enemy's obtaining information about the belligerent in whose behalf the reconnaissance is made—that is, protective or negative reconnaissance—and the obtaining of specified information about the enemy, which may be called active or positive reconnaissance. In open warfare the first is carried out by the screen either of cavalry or infantry or both which is sent out by the commander to deny the enemy observation of the movements of this main body; in position warfare by the first-trench system, or according to later ideas by the organization of a forward zone masking the "Battle Zone" where the real resistance would be put up. The second object of reconnaissance is brought about by the driving in of the enemy's protective system and so obtaining contact with his main body, or by the employment of patrols and scouting parties, whose object is to obtain timely information with a minimum of deployment. Position warfare involves a state of continual contact, that is, the protective screens of both armies are always facing each other at close quarters. In open warfare, especially when armies are operating over large extents of territory, manœuvre is necessary if the protective screens, to say nothing of the main bodies, are to come into contact with each other.

The objects of ground reconnaissance are varied. It may be purely topographical, that is, it may be concerned with the acquisition of unmapped information about the ground in anticipation of movement over or occupation of that ground. It may be tactical (that is, it will endeavour to discover the positions held by the enemy and the strength and distribution of this defence), or it may be concerned with the obtaining of "identifications" (that is, information about the troops of the enemy in line, either by the capture of prisoners or of documents).

*Air Reconnaissance*, in spite of certain limitations, has many advantages, however, over ground work. One of the latter is its greater freedom. Machine-guns impede ground reconnaissance much more effectively than A.A. weapons and hostile aircraft impede air reconnaissance. Moreover a greater area of ground can be covered in a shorter space of time. By means of messages dropped at prearranged stations or by wireless, information can be sent back in a minimum of time; and, since the observer in an aeroplane sees the ground as a map and so can easily "pinpoint" what he sees, positions of troops, etc. can be given with a greater accuracy than is possible to the ground observer. In the watching and control of enemy reserves aircraft can perform services which are not possible for any other means of reconnaissance. Contact with the enemy cannot at present be obtained by the use of the aeroplane; but, owing to the fact that the aeroplane can penetrate the protective screen of the enemy and observe the movements of his main forces, a type of contact can be obtained from the air with greater efficiency than from the ground.

The use of the aeroplane camera makes air reconnaissance even more valuable than it would otherwise be. Owing to the height and also the speed of the aeroplane, many details escape

the eye of the keenest observer. The use of the camera almost eliminates the personal factor. All that is necessary is that the observer should be able to manipulate the camera and have sufficient knowledge of the map to take the photographs at the correct moment. The image of the ground on the plate is very quickly developed and printed, and studied under favourable conditions away from danger of enemy fire. Aeroplane photographs became more and more important during the World War. Cameras were improved; the men whose task it was to interpret the photographs after they were taken became more and more expert; and the possibilities of their work became more fully realized. At first several difficulties had to be faced, the chief of which were mist and vibration. The mist in the atmosphere rendered the photographs taken so indistinct as to be almost useless. But by the use of filters (that is pieces of tinted glass or celluloid placed next to the camera lens), it was found that photographs could be taken through a mist which the human eye could not pierce. Vibration caused more difficulty. The danger that, through the throbbing of the engine, the camera might be tilted while the photograph was being taken, was finally eliminated by the use of rubber cushions which absorbed the vibration of the aeroplane.

In addition to the important photographic reconnaissance, other types of air reconnaissance were used during the war. Each dawn and dusk, and at other times when conditions made it necessary, reconnaissances were carried out by powerful machines. Their principal duties were to keep close watch of road and rail movements of the enemy. Since these movements mostly took place during the night, dawn and dusk were the times when results were most likely to be obtained. The day-to-day results of the reconnaissance were plotted in "activity maps" which made it possible to gauge the normal movement in any railway line on the battle-front, and so, with the aid of collateral information, to establish conclusions as to significant abnormalities. Another type peculiar to position warfare was the trench reconnaissance. This was carried out by an aeroplane flying low over the trench lines. It had for its object the discovery of the state of the enemy's defences, what portions of the line he was holding, the location of machine-guns and trench mortars, and all those numerous details a knowledge of which was required in carrying out an attack or raid on strongly organized positions.

"Artillery" air reconnaissance was primarily intended to counteract the effects of the enemy's artillery fire on one's own troops. Flying backwards and forwards along the battle-front, the airman watched carefully for the fire of enemy batteries. When a battery opened fire, its position was signalled by wireless, and it was promptly engaged by the counter battery.

One of the chief difficulties with which a commander has to contend during an attack is the difficulty of knowing quickly how far the attack has succeeded and to what distance his troops have penetrated the enemy lines. The aeroplane therefore has a useful function in maintaining contact with attacking troops. In the World War machines carrying out this duty were called "Contact Patrols." They were not intended for fighting purposes, but to determine the position of the attacking troops. In open warfare the aeroplane landed in or near the forward positions and received an account of the situation from the troops themselves. But when this was impossible prearranged signals of various kinds were given by the foremost troops to show their position. A good airman worked without any help from the ground troops. He would fly at a low altitude, sometimes as low as 50 ft., along several miles of front, and place correctly the position of all the forward troops. To determine the position of the enemy and also to discover in what direction counter-attacks were maturing the airman had to rely on his powers of observation. Such work was often very dangerous, since it necessitated flying low over the enemy. Various signals were devised by means of which the aeroplane could inform the infantry of an expected counter-attack. The duty of watching for such threats was sometimes assigned to a separate counter-attack patrol; but more usually it fell to the contact patrol itself. Having obtained his information the pilot's object was to give that information as speedily as possible to those who needed it. He did this as a rule by dropping a message or a marked map at a prearranged station; or he landed at a headquarters and explained the situation in detail to the commander; or he returned to his aerodrome where an officer of the intelligence staff interrogated him and telephoned or telegraphed his information to those whom it concerned.

*Detecting Agencies.*—Differing from reconnaissance principally in the absence of "contact," but otherwise analogous, are those means of obtaining information which may be called collectively detecting agencies. These are visual or instrumental, and in some cases a combination of the two. V'sual observation for intelligence purposes differs from the ordinary watching duties of sentries in that it is an organized service—partly or wholly under intelligence control—for the observation and recording of all enemy activity within the range of vision of the front-line observation post, the tree or belfry behind the line, or the captive balloon in which the observer is stationed. Its records go into the common stock of tactical intelligence material, its work is facilitated by a special equipment of maps, telescopes, etc., and its various elements are so placed and coordinated that the exact location of the enemy activity recorded (*e.g.* digging) can be fixed by intersection. In its most precise form, observation becomes "flash-spotting," that is, the location of an enemy battery position by simultaneous observations of a gun-flash from two, three or more visual posts provided with goniometers and connected electrically with a central where the result of the intersections is plotted. Flares, Véry lights and searchlights to facilitate night observation, are aids to defensive sentries, not to "positive" intelligence.

Detection by instruments (other than the usual flash-spotting in which, after all, the quickness and accuracy of the observer is the main thing) is automatic. Instruments are disposed to receive, transform and transmit impulses from outside, and the human element (except in instruments of the geophone class used in mining) is only introduced at the "central" or exchange station—*i.e.* at the point of synthesis, and not in collection. Such are sound-ranging installations, wireless interception and direction-finding apparatus, and electrical listening-posts. All contribute to the common stock, and each affords collateral checks—called by the French *recoupements* or "intersections"—on the data provided by the rest, or by reconnaissance proper, or from other sources.

*Interpretation.*—It remains briefly to outline the way in which these means are used to answer the three questions that interest the command at the front: (1) What are the enemy's dispositions, (2) what and where are his defences and other installations, and (3) what are his *intentions?* The third of these questions is really the interpretation of the other two. It depends on military knowledge, on *flair*, and especially on an exact appreciation of what constitutes normal and what abnormal "activity." The first and second questions only concern us here.

*Enemy Dispositions in the World War.*—The Allied and German armies on the western front faced each other with only a small space of ground between them. Except when an attack was in progress contact was maintained by frequent raids into the enemy lines, by means of which prisoners and documents were captured. The units to which prisoners belonged was revealed by their pay-books and identification discs. German prisoners were, moreover, usually willing to state the units who were occupying the line, as well as the general dispositions for holding it. In trench warfare, then, provided that raids were frequently and successfully carried out, the problem of identifying the troops in line was not difficult.

The problem of the grouping and location of enemy reserves is far harder. It is similar in open and position warfare with the important exception that in open warfare the proportion of undeployed, undisclosed reserves is, on the whole, higher. Even if the intelligence service of an army is able to locate the reserves of the enemy, it does not follow that it will be able infallibly to predict the enemy's intentions or area of attack. The

concentration may lie in an area where movement in several directions is equally easy, as in the German concentration on the Mézières transversal in March 1918. But the less an intelligence service knows about the location of the enemy reserves, the more danger is there of a surprise.

For the watching of the enemy reserves there are four chief sources of information: the statements of prisoners and deserters, captured documents and correspondence, agents' reports, and the interception of enemy wireless messages. Much of this information is of an uncertain character and powers of deduction and imagination are necessary to piece together and coördinate the mass of material.

(*a*) When frequent contact is maintained it is easy to discover what new formations have arrived in line and what formations have gone into reserve. Prisoners can sometimes give information about the movements of the unit or formation they have relieved. They may also be able to say what formations they have seen in the journey to the line and what formations were grouped in the area from which they have moved.

(*b*) Captured documents and correspondence are of high value. Even a small attack results in the capture of many documents. The facilities with which maps and documents can now be produced has resulted in the issue of numerous orders, instructions and summaries; as regards maps, the contrast with previous wars is even more marked. In 1870 the Government of National Defence at Bordeaux was only able with difficulty to assemble *one* set of 1/80,000 maps of France for reproduction and issue to staffs, whereas nowadays a single division going into line may receive as much as a ton of maps. One of the most fruitful sources of information is letters written from men of formations in reserve to their comrades in line, which often reveal the location of an unidentified reserve.

(*c*) The work of agents is dealt with in another part of this article. The usefulness of agents in matters of tactical intelligence varies according to the kind of warfare which is being fought. In a war where the opposing armies are manœuvring over a large tract of country and where the front is not fixed, the passing of agents across the lines and their return with the information gained is comparatively easy. On the other hand information becomes out of date far more quickly in manœuvre warfare than in position warfare. On the contrary, when the front is fixed, as in the late war, the passage of agents is more difficult but their information holds good for a longer time.

(*d*) The picking up of enemy wireless messages is also a fruitful source of information. These messages are in cipher,[1] and can sometimes be deciphered quickly enough to yield useful information. But in any case the positions of enemy wireless masts can be discovered by means of direction-finding wireless and valuable deductions can be drawn from their groupings and activity, even if not one of the intercepted messages can be decoded. At one period in the campaign of 1918, a silent battle of which few were aware was fought between wireless intelligence and wireless "Camouflage" so called, in which one side sought now successfully, now in vain, to mislead the other by varying the positions of masts and the volume of traffic.

*Enemy Works and Installations.*—Information about the defensive system and the organizations of the enemy is obtained from reconnaissance and to some extent from (*b*) sources, but the most fertile and certain source of information is the aeroplane photograph. Aeroplane photographs are of two types, the oblique and the vertical. Those of the first type are taken from heights of 200 to 1,000 ft. with a tilted camera. Taken at a 1,000 ft. they show the ground as it would appear to an observer from the top of a mountain. Not much detail is visible, but an excellent idea of the general lie of the land is given. Taken at a lower altitude, such details as trench construction, loopholes and machine-gun emplacements, entrances to dugouts, roads, trees and hedges are apparent. The more important type of photograph, however, is the vertical, that is, a photograph taken from directly above, with the camera pointing straight downwards. The appearance of objects on the vertical photograph is stranger, and puzzling to the uninitiated student. All objects are seen from above, so that only their tops and shadows are visible. Everything is seen in plan as on a map and to be able to appreciate a vertical photograph one must, so far as circumstances permit, accustom oneself to see the ground from above, and in any case cultivate a sympathetic understanding of maps as maps.

Vertical photographs may be taken at almost any height. If taken too low the result may be blurred owing to movement, but clear photographs may be obtained from 2,000 to 20,000 ft. The scale of the photograph varies according to the height at which the photograph is taken and the focal length (that is the distance between the lens of the camera and the photographic plate) of the camera used.

Different types of cameras are used according to the scale of photograph required. If a forward trench system is required to be photographed a short focal-length camera (say 8 in. or 10 in.) will be used on a machine flying at a low altitude (say 6,000), so as to get a photograph on a comparatively large scale. On an extensive photographic reconnaissance of an area some miles behind the line, where the object is to get photographs of a large area, not for study in detail, but to discover what constructive work is engaging the enemy, a "wide-angle" type of camera (*i.e.* a camera of short focal length, but, since the photographs are taken at a great height, [15,000 ft. to 18,000 ft.,] on a full plate, show a large area on a small scale) is employed. With this type of camera a larger area can be covered in a short time. If these wide-angle photographs show details of which a more thorough examination is desirable, large-scale photographs can be taken from a height of 15,000 ft. and more with a long focal-length camera (20 in. or even 48 in.) which will show clearly small dumps of material or even the actual barrels of guns.

In working on aeroplane photos there are two stages, the reading of the photo (often called interpretation, though the word is avoided here as having been used in another significance in this article) and its "annotation," that is, the redrawing of its indications in map form for the use of the army generally.

Aeroplane photographs record colours and accidents of the ground (such as bare earth, vegetation, woods, etc.) in terms of light and shade. The ground appears as a simple or complex pattern, in black, grey and white. Though the aeroplane photographic plate is affected by colour, that effect is not so marked as the effect of texture and shadow. For instance, a stretch of dry earth which to the eye appears dark will appear almost white on the photograph. The reason for this is that being smooth it has no texture or contained shadow, and consequently reflects light. Vegetation, on the other hand, which to the eye appears light will photographically be at the dark end of the scale because of its texture and contained shadow. It absorbs rather than reflects light. So when the nature of objects in an aeroplane photograph is to be determined colours must be judged principally in relation to texture. The ground must be visualized vertically not obliquely.

The reading of aeroplane photographs, which necessitates a keen, trained eye, consists in the "spotting" of the numerous details which the photograph contains; its annotation, which is in effect the labelling of the various objects shown, presupposes ability to appreciate these details and their relative importance in the enemy's system of defence and organization. When a detail has been discovered, the examiner of the photograph must decide its probable nature and its rôle and importance in the enemy's system of defence, offence or supply. Details are often very similar in photographs and their nature can only be discovered by considering them in relation to their position and the surrounding details as well as in relation to the current tactical practices of the enemy. The reading and translation of aeroplane photographs indeed is not a solitary science. The interdependence of all branches of intelligence work has already been emphasized and certainly this is no exception. Many details can be seen on photographs and their nature determined from photographs alone; but there is much that will be doubtful and must be reëxamined in the light of prisoners' statements, ground and air observations, captured documents and captured maps. Conversely, the aeroplane photograph may supply missing links in a chain partially established otherwise.

Unlike photographs taken obliquely, which convey something to the merest novice, the vertical photograph must be carefully studied before it reveals its secrets. Only the tops of objects and their shadows are visible and it is only through the latter that the nature of many objects seen on a photograph can be determined. All objects have shadows. On a dull day

[1] In the earlier campaigns of the war, strange to say, messages in clear were sent on several important occasions.

they may not be apparent to the naked eye, but they always show clearly on a photograph. The first step, therefore, in examining a photograph is to discover from what direction the light is coming, that is, the position of the sun in relation to the photograph. This can always be discovered by examining the shadow cast by some known object such as a house or a tree. By a study of shadow not only can we discover whether an object has height or depth, but we can also get much valuable information about its shape and size. Thorough familiarity with the effects of shadows is in fact an absolute essential to the correct study and easy appreciation of aeroplane photographs.

Photographs must be examined systematically, detail by detail, and frequent comparison of photographs taken on different dates made. If a day's photographs are examined alone, many small details will be missed, and it is impossible to follow progress in the construction of enemy works, and to note increase and decrease in the size of enemy's dumps and aerodromes, etc., so important in studying enemy intentions.

Aeroplane photographs are of greatest value in position warfare. In open warfare their use is not so great. Armies advance over areas of so great an extent that it is often impossible to take photographs and get the information from them before the area photographed has ceased to be of interest. Moreover, the defences conducted in open warfare are usually of so simple a nature as not to be visible in photographs. Machine guns are concealed in hedges or in the windows of houses, guns are fired in the open from sunken roads and the edges of woods. Protection is obtained by the utilization of natural cover. Such positions if they were occupied for any time would (unless elaborately camouflaged) betray themselves by the tracks made by men or vehicles approaching them; but if they are only occupied for a short period these tracks do not form. In open warfare therefore much more valuable results are obtained from airmen's reports than from their cameras. It is only when the enemy makes a stand for a few days on a definite line that photographs become valuable. During the first part of the German retreat from the Somme to the Hindenburg position in March 1917 air photographs were of little value. When however the British troops were held up by an outpost line in front of the main Hindenburg position photographs again became of use. On one occasion photographs were taken of a temporary enemy position, the photographs were brought back, developed and printed, and the results delivered by aeroplane to the divisional commander on that front in about an hour and a half. During a retreat in open warfare photographs can be used in watching the pushing forward of the enemy's communications and aerodromes, and during an advance in discovering what demolitions he has carried out.

We must now consider the tactical use of photographs. At the battle of Neuve Chapelle (1915) the maps used for the attack were simply ordinary topographical maps, with the enemy positions roughly marked. If defences are not of an elaborate nature, such a map may be sufficient. But when an attack is being made on a defensive system elaborately organized and several miles in depth, something more exact is necessary.

First of all thick wire entanglements must be faced. When these entanglements consist of several rows, each row from 20 to 50 yd. deep, wire cutters are useless, and gaps must be made either by artillery or tanks. In either case, for the ranging of the guns or for the drawing up of the plans for the tank attack, an accurate map of the wire entanglements is necessary. Numerous trench lines must be captured, dugouts both in the trench lines and in the terrain between the lines must be dealt with, machine-gun emplacements must be captured, and special arrangements must be made beforehand to subdue strong points of resistance, redoubts, fortified woods, farms, quarries, etc.

To make the careful preparations necessary for an attack on such a position, not only the commander, but also his subordinates, must possess an accurate map of the position, which may be, and in the latter part of the war was, so deep that ground observation of its real defensive heart, the "battle zone," is impossible. The information then must come from the air, and moreover, though a competent airman may make valuable observations, the only means of plotting that network of trenches and other defensive organizations on to the map is by means of the aeroplane photograph. This may be defeated in some details by effective camouflage or by the successful use of natural cover, but in general an accurate map of the enemy's defences can be constructed from it—or rather, them, for a particular photo is or should be only one of a series which shows the changing aspect of the ground as man's works are superimposed on it. Besides trenches, wire, and close defence positions of all sorts, the camera attacks the enemy's artillery positions. In some cases innocent ground begins, in succession photos, to show works, tracks and the like, until it becomes so definite that the balloons and the sound-rangers and flash-spotters only confirm what is already certain. On the other hand, photo deductions may be doubtful or even impossible till the battery reveals itself to the other agencies by coming into action. In either case the work of the camera continues in aid of the artillery. Amongst the most important services rendered by the air photograph is that of recording the effects of bombardment upon battery positions, trenches, wire, strong points, dumps and communications.

Photographs are also of value in studying enemy organizations, roads and tracks used by the enemy, billets and positions of reserves, signal communications, *i.e.* buried cables, air telephone lines, light signal stations, railways (normal and light-gauge), unloading stations, ammunition and supply dumps, stations and railway sidings, hospitals and aerodromes.

(C. F. A.; F. C. H.)

(C) *Secret Service and Counter-intelligence.*—The section of military intelligence known in Great Britain as I (b) is charged with two functions somewhat opposed in character, but having this in common, that the methods employed in each are, generally, secret. This factor makes it difficult to submit those functions to public dissection except on general lines; what follows, therefore, is confined within those limits.

Broadly speaking, the duties of Intelligence (B) are:—(1) *Offensive*, in the acquisition of information as to the enemy's military resources, numbers, plans, movements and dispositions, by means other than those employed by I(a), which are identifications by contact; examination of the enemy and other press; scrutiny of captured documents and prisoners; air reconnaissance and photography; sound-ranging and other means. (2) *Defensive*, in the prevention of the acquisition by the enemy of similar information about our own forces. These together make up what may be described as Secret Service, and both involve the use of secret agents and secret methods.

Apart from the close connexion between them, the knowledge and experience of enemy methods gained in either sub-section is so immediately beneficial to the other that the functions of the two sub-sections are complementary and indivisible. They should, therefore, be controlled by one directing brain, especially in the field, where rapidity of action and of the circulation of information is essential. In peace-time at home, where the urgencies and difficulties of active service conditions do not arise, separation is permissible, though not generally desirable.

The offensive sub-section, to which alone the name Secret Service is popularly applied, can only be referred to in general terms. Its duties are similar in peace and war, and are directed towards the collection of information in enemy territory. For this purpose secret agents, or spies, have to be employed. The duties of these agents again differ but little in war and peace; but war increases their importance, and with it their difficulties and dangers. Whether they work as agents *à poste fixe*, like the agents of the notorious Stieber in France before and during the campaign of 1870; or whether they are sent on definite missions, or on general roving commissions, their objective is the same: information about the enemy. This objective is unaltered whether they penetrate into enemy territory through the ports, in the guise of peaceful neutrals armed with all the necessary papers, or whether they get there by other means. In war these other means may include penetrating the enemy

lines, either in uniform or *en civil*, during the progress of an action; crossing the enemy lines and landing behind them in an aeroplane, either by the machine coming to the ground or by means of a parachute; crossing similarly in a free balloon; or crossing a frontier guarded by sentries and electrified wire, by evading or killing the sentries, and climbing the wire in insulated boots and gloves. False papers, disguises, secret ink and all the other tricks beloved of the spy novel may form part of their equipment, but normally the less theatrical the spy the less likely he is to attract attention. In practice, the most dangerous and efficient spy is probably the least sensational in his methods; when arrested he invariably has all his papers in order and is the most plausible person alive. Men, women and even children of all grades of society and of all professions, may render services of varying degrees of importance, but all useful to a system of espionage. A spy system in war involves the employment of many thousands of persons: post-boxes, *passeurs*, *contrebandistes* and guides, train watchers, pigeon men, couriers, runners, reliables who will give shelter to agents and escaped prisoners, and notables who are capable of organizing a service. All have their respective parts to play behind the lines in modern war; and that part, far from being ignoble, may be, if actuated by patriotism, as noble, as dangerous and as heroic as any played in the armies in the field.

In spite of all the precautions adopted as the result of experience in the World War, the collecting of information is not the difficulty; that lies in the transmission of information when obtained. Over this subject a veil, unfortunately, must be drawn. Agents may carry pigeons to send back, or portable wireless sets for communication with their employers, and messages have been shot over a neutral frontier by crossbow. The use of directional wireless and ordinary vigilance and common sense soon lead, however, to discovery, and necessitate a change of *venue* for the agent, and the application of fresh methods after a short time. It is only necessary here to say that, contrary to a popular belief, signalling by an agent by any means from, or close behind, the enemy lines is almost impossible, except in open warfare. In trench warfare, even if it were possible, it would be of little use, as any information to be gained there is better obtained by other means. The agent's useful information is gleaned much farther back, and to get it he requires a thorough and careful training. Apart from the control of agents and of the administrative, financial and clerical questions involved in that work, the duties of the chief of this sub-section are to get information by all possible means. Amongst other methods employed in the late war was the dropping of pigeons by automatic release from free balloons. Advantage was taken of the wind's force and direction to regulate their fall in or near any desired neighbourhood, and there they were picked up by the inhabitants. Following the instructions enclosed, the latter often gave rapid and valuable information as to the movements of the enemy.

Another form of activity on which agents may be advantageously employed is sabotage, *i.e.* the destruction in the field of bridges, telegraphs, lock gates and communications, and of munition factories and similar organizations in enemy home territory. The Germans are alleged to have employed these methods, even in neutral countries, where munitions and war material were being manufactured for the Allies. In the field, such work is most advantageously linked up with operations, either just before they begin or whilst they are in progress. If contemplated as a prelude to operations it must always be remembered that they may serve as warning of an offensive. In any event the officer directing such schemes must remember the probable consequences to an allied population in territory occupied by the enemy, on whom punishment will be visited. Sabotage of this sort is naturally easiest in crowded centres, where circulation is difficult to control; and although in war risk to human life, even of non-combatants, must in some cases be a secondary consideration, this fact alone requires that sabotage, if undertaken, should be expected to have definite results.

The duties of the other, the defensive, sub-section are popularly described as *contre-espionnage*. Although the duties, as in the case of Secret Service so called, are the same in peace as in war, the machinery and methods vary considerably according to the conditions under which they are carried out. The varying conditions referred to are: (1) in home territory, in peace and in war; (2) in allied territory; and (3) in enemy or occupied territory. In the two latter cases war conditions only come into consideration.

Of these varying conditions the first provides, perhaps, the easiest problem. The *contre-espionnage* section commands, in peace and in war, all the assistance of trained police throughout home territory; of censorship; of port control; of hotel registration; of the erection of arbitrary barriers such as prohibited areas; and of all the preventive measures which may be the outcome of years of experience in combating enemy espionage under all conditions. Although Intelligence (B) in the field in occupied territory would equally enjoy these powers, and, in addition, the arbitrary powers of the conqueror in the territory of the conquered, and would have the advantage of knowing that the whole population is potentially hostile, the machinery at its disposal to cope with it would be largely improvised and, therefore, at first, not so efficient. In allied territory the difficulties are greater, as it is the ally who, naturally, controls in his own home territory all the real preventive machinery. He is, in addition, possibly susceptible about interference with either his C.E. Organization, or with the native population. Under these conditions *contre-espionnage* is carried on largely on sufferance, and requires the exercise of much discretion and tact.

It is necessary to remember that the object of *contre-espionnage* is, first and foremost, prevention. The catching of spies, interesting though it is, is entirely subsidiary; its principal value lies in disclosing the holes in the preventive net and in directing the attention of the controlling staff towards the proper remedies to be applied. In the zone of the armies the principal value of an efficient *contre-espionnage* system is a moral one. Troops and their commanders must be relieved of their anxieties about enemy activities in their midst; but from what has been written above it will be seen that those anxieties are often based on not very solid grounds, at least in trench warfare. Troops commonly attribute to an enemy secret service of any efficiency powers far beyond the capacity of any S.S. Organization. It is, of course, the effect of the unknown on mass psychology; but the influence on *moral* may be prodigious unless means are taken to check it.

From what has been stated it will be seen that the *contre-espionnage* sub-section falls naturally into two divisions: (i.) the investigation of suspected cases of espionage, and (ii.) the control of the population. It is not possible to enlarge on the methods of investigation employed by a *contre-espionnage* service; although in general they resemble ordinary police detective methods, in details they differ widely from them. They require technical knowledge not usually possessed by ordinary police personnel; and even trained police-detective staffs require special training to be useful in *contre-espionnage*.

In endeavouring to prevent the collection of information by the enemy's agents it is necessary to remember that this may be gained equally (i.) from your own troops and (ii.) from the civil population. The former may sell or convey information deliberately, but it is far more probable that they may convey it to the enemy's agents through their indiscretions. Investigation of treachery requires no difference in treatment, whether it occurs among troops or civilians, and the question need not therefore be further examined. The problem of dealing with leakage of information through indiscretion, however, is a different one, and requires special consideration. "Leakage" may occur in several ways; gossip amongst the troops about impending operations, especially when they are on leave and out of the line; indiscreet conversations and messages on field telephone and buzzer; misuse of code in telegraph and wireless; marking of railway trucks, transport and billets, with inscriptions which give identifications of units; indiscretion in correspondence; careless handling of confidential papers and books; taking

orders, codes, books, papers of any kind, even private letters, into the front line; wearing of regimental, brigade or divisional badges and markings, which reveal identifications, and many analogous ways. All these require special treatment. In many cases this demands merely vigilance to see that these things are not done, and that orders are constantly issued to the troops on the subject. Careless conversations on field telephones require "police" listening sets to record them, so that action may be taken against the offenders. Gossip about operations can be dealt with by the punishment of the offenders when caught; otherwise it is best coped with by the deliberate circulation of false rumours by Intelligence (B) through their police and agents. It is therefore one of the essential duties of the I(b) personnel that they should know what is going on amongst the men in their own army; from this it is an easy stage that they should keep the higher command informed of the *moral*, the grievances and the current rumours, not only of their own army, but also of the civil population and of the allied army and even amongst allied official classes. Every case of suspected espionage reported by the troops, even the most obvious cases of spy fever, must be investigated, and the results reported and circulated among the troops.

Finally, Intelligence (B) should advise the operations section of the precautions necessary in connexion with contemplated operations. This implies the closest coöperation with "O"; but it also logically involves the allocation to Intelligence (B) of camouflage, and similar mechanical methods of preventing the acquisition of information by the enemy. This was not the case in the late war; and this omission was, in the writer's opinion, a fault in organization.

The other sub-section of the *contre-espionnage* section is responsible for the control of the civil population. This involves a division of the area occupied by the army into zones for the purpose of the control of circulation, and control of the use of telegraph, telephone and other methods of communication, which might be of use to enemy agents. These restrictions vary in strictness according to their proximity to the fighting front, *e.g.* in the forward or army zone no access would be permitted to civilians of any sort; in the less forward zones civil liberties are less and less interfered with, until in the rearmost zone life may be almost normal for war-time.

The same sub-section is responsible for the drawing up and issue of all necessary regulations; the placing of the necessary port, frontier, railway, road and other controls at points of entry into the various zones. Here would take place the interrogations of persons entering or leaving the zone, the issue and *visa* of passes and the general supervision of civilian traffic. The form of all necessary passes (*laissez-passers, sauf-conduits*, protecting certificates, etc.) would be drawn up by the sub-section, in consultation with the provost-marshal's branch, and all arrangements made to fit in with his controls.

Card indexes must be maintained of doubtful persons, as full details as possible being given, to ensure their detention. *Contre-espionnage* summaries and instructions must be issued from time to time, and provision must be made for the rapid circulation of such information to all controls and I(b) personnel. Amongst the other duties of this sub-section are evacuations of undesirables, prostitutes and suspects; supervision, licence and withdrawal of telephonic and telegraphic facilities to civilians, in accordance with military exigencies; interrogation of *rapatriés;* preparations of lists of guides, notables and persons who may be useful in territory occupied by the enemy, in case of an advance; lectures to troops on precautions against leakage of information, even after capture; and all general precautions against espionage where it is a case of dealing with the population in the aggregate, as opposed to the individual.

Both sections must keep adequate and up-to-date records, carefully cross-indexed. In the case of the offensive Secret Service it is undesirable that the names, tasks and whereabouts of agents should be known to anyone but the officer under whom they actually work. Any such records kept must be in safes or [illegible]g-boxes.

As regards the machinery employed, both sections require large numbers of intelligence police. Their allocation in the zone of the armies is usually on an army, corps or divisional basis, *i.e.* certain detachments of officers and men (I.P.) are allotted to the headquarters of armies, corps and divisions. On the L. of C., or even in the army zone in the case of prolonged stationary warfare, they are best allotted on an area system, to ports, bases and areas. This has the advantage of acquainting the personnel intimately with the areas, the inhabitants and the special duties called for by special conditions.

One final duty remains to be mentioned—the conveyance of false information to the enemy. This cannot, unfortunately, be dilated upon. It is best undertaken by the head of I(b) himself, in consultation with as few persons as possible. The process, if it is to be usefully employed, involves the complete confidence in him of the higher command and a foreknowledge of their plans and dispositions. It requires, therefore, that he should be above all else a person of solidity and discretion. Apart from other qualifications there is indeed no room for the employment in Intelligence (B) of any person in any grade who does not possess these characteristics. (R. J. D.)

**INTERNAL COMBUSTION ENGINES.**—It is usual now, as a matter of terminology, to deal comprehensively with gas engines and oil engines under the general description of "internal combustion engines," and the present article gives some account of the new developments that have been made between 1910 and 1921; in the earlier volumes of this work (11th ed.) a full account will be found (under GAS ENGINE, 11.405 *seq.*, and OIL ENGINE, 20.35 *seq.*) of the history of these very important engines up to 1910, together with a statement of the engineering thermodynamics of the subject.

Gas and oil engines in 1921 might conveniently be grouped as follows:—

GROUP 1. LARGE GAS ENGINES

(*a*) Of horizontal, slow-speed, double-acting type, of both 4-stroke and 2-stroke cycles.
(*b*) Of horizontal and vertical medium-speed, single-acting many-cylindered type, usually 4-stroke.

GROUP 2. MEDIUM GAS ENGINES

Usually of horizontal single-acting, 1- or 2-cylindered type, working on the 4-stroke cycle.

GROUP 3. HEAVY OIL ENGINES

(*a*) Of large Diesel design, both 4-stroke and 2-stroke.
(*b*) Of "semi-Diesel" type, both 4-stroke and 2-stroke.
(*c*) Of the low-compression hot-bulb, or Akroyd type, and normal heavy oil engines with vaporizers.

GROUP 4. "LIGHT OIL" ENGINES

Small quick-revolution usually multi-cylindered engines of the 4-stroke Daimler, or 2-stroke Day type; all single-acting, and usually vertical.

GROUP 5. SPECIAL TYPES

(*a*) The Humphrey Pump.
(*b*) The Holzwarth Turbine.
(*c*) The Still Engine.

*Group 1 (a). Large Gas Engines.*—The period 1910–21 saw a considerable increase in the number of large engines of the slow-running horizontal type. Considerable difficulties were encountered at first with large gas engines as the necessity of providing very complete cylinder cooling arrangements was not clearly realized, and cracked and seized pistons, failures of valves, and ruptured cylinders were not infrequent. These difficulties had by 1921 been completely overcome, and these large engines work with the utmost regularity and freedom from trouble.

The type under discussion—frequently referred to as the "Nürnberg" or "M.A.N." engine, on account of the important part taken in its development by the Maschinenfabrik Augsburg-Nürnberg A.G.—is illustrated in section in fig. 1 and in external appearance in fig. 2.

The engine shown is a 4-stroke, or "Otto" cycle, tandem, double-acting, single-crank, "blowing" engine of M.A.N. type constructed by the Lilleshall Co., Ltd., of Shropshire, England. Rated at 1,200 B.H.P. and running at 90 revolutions per minute on blast furnace gas, it is capable of compressing 26,000 cub. ft. of free air per minute to a pressure of 8 lb. per sq. in. above atmosphere.

Within each of the working cylinders A and B is a piston F 35 in. in diameter and having a stroke of 43½ in.; the pistons are mounted upon a common piston rod which terminates towards the right in

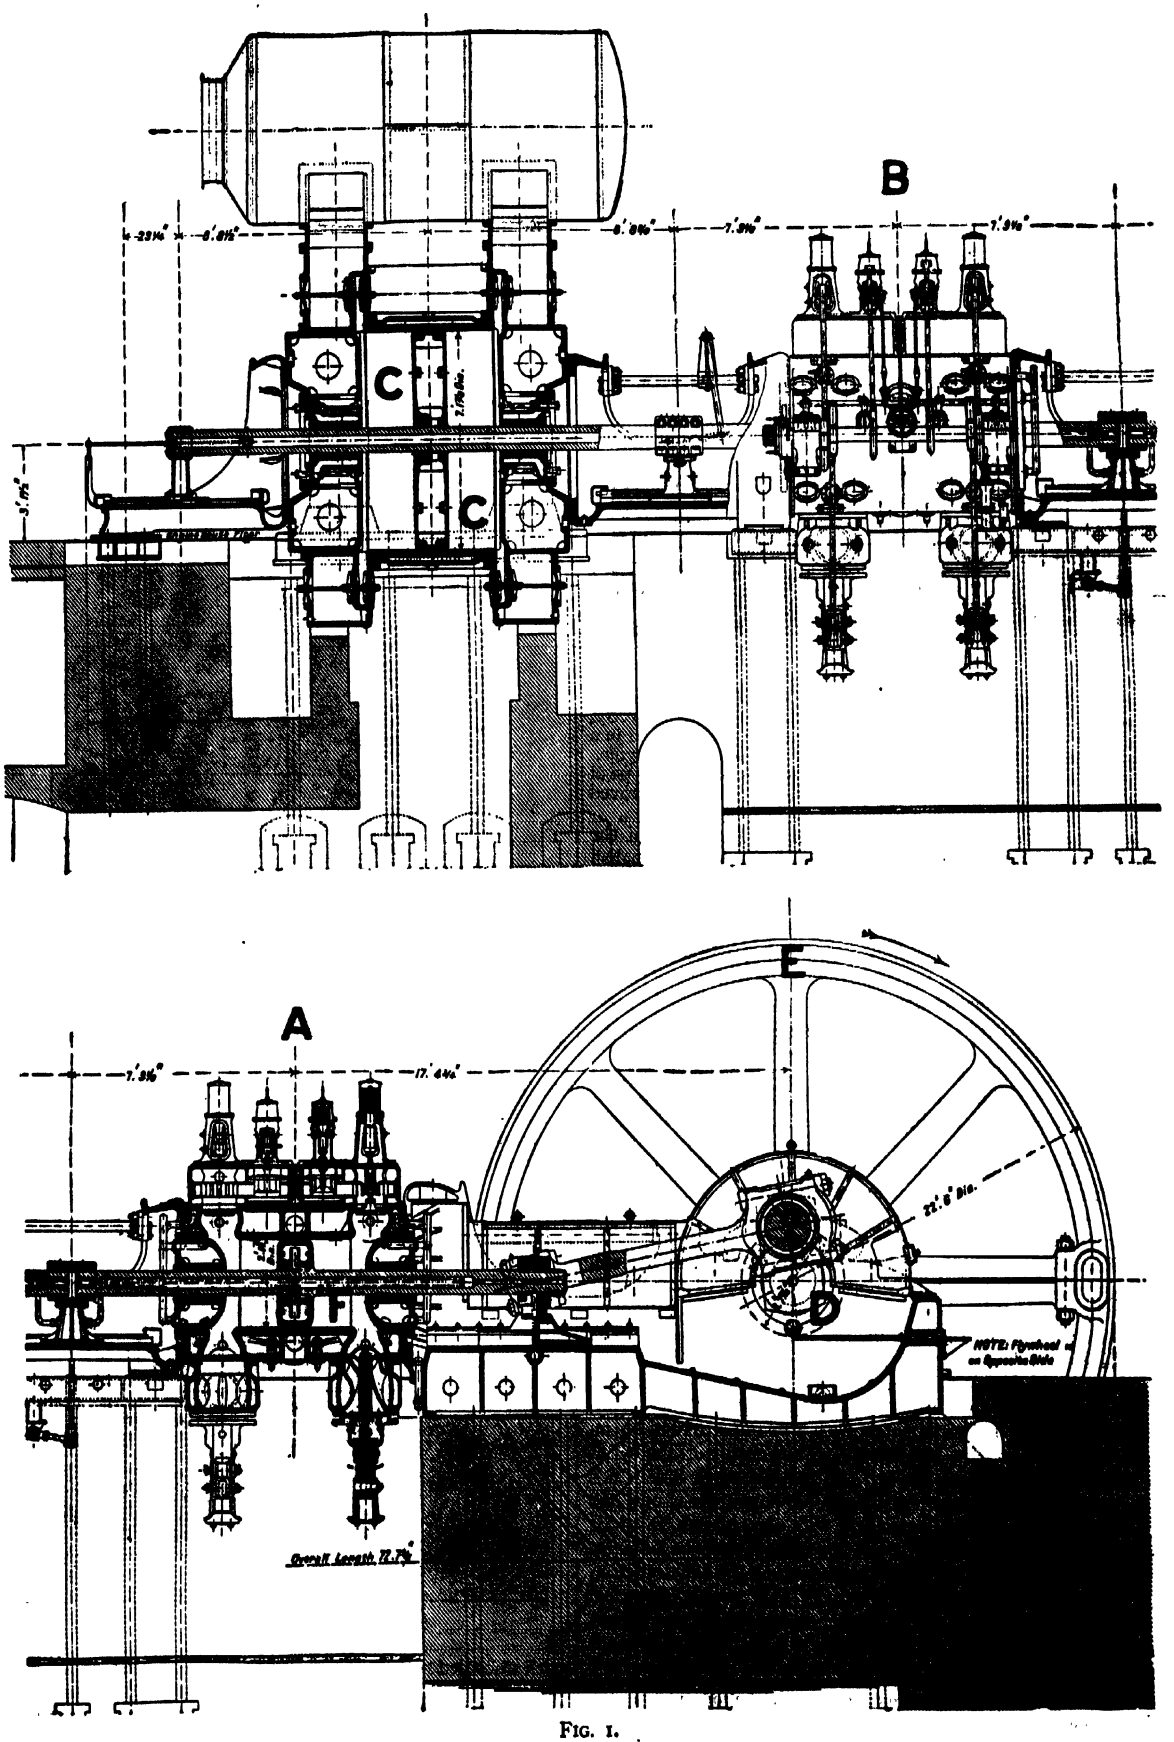

FIG. 1.

a crosshead, whereby it is attached to the crankshaft D by means of the usual type of connecting-rod. On the left of the working cylinders is a large double-acting "blowing" cylinder, or air pump, CC, with a bore of 85⅞ in.; this is a conspicuous feature in fig. 2.

The valves are operated by mechanism driven by the crankshaft, and a large fly-wheel E, 22½ ft. in diameter, is provided to ensure a sufficiently uniform motion of the engine. The long piston rod carrying the two working pistons and the air pump piston is borne on four crossheads as shown; the pistons "float" in their respective cylinders, thus minimizing engine friction and wear, as all the weight is carried on these four external crossheads.

It will be observed that the cylinders and cylinder covers are well water-jacketed; the pistons, piston rod, and exhaust valves are also water-cooled. For the cylinders and their covers the cooling water is supplied at a pressure of about 15 lb. per sq. in. above atmosphere; for the pistons, piston rod, and valves, the water pressure necessary is about 55 lb. per sq. in., due to their reciprocating motion. Close to each cylinder is fitted an open water tank into which the various cooling-water pipes discharge in full view of the attendant. Each discharge is fitted with a regulating valve and thermometer, whereby the cooling-water temperature from the several parts of the cylinders, pistons, etc., may be separately adjusted while the engine is running.

FIG. 2.

Special oil pumps are provided for cylinders, stuffing-boxes, and exhaust valves, so that each of these parts is lubricated directly, with provision for separate adjustment. Surplus oil is collected in a sump, filtered, and returned to an oil supply tank above the engine.

Enough has been said to show that in its present form this type of large gas engine is well designed in every detail, and it has proved itself a very safe, economical, and reliable power producer.

The engine illustrated above is installed in the works of the Barrow Haematite Steel Co., and was built by an English engineering firm; the type has, however, made most progress on the European continent. Thus, from 1908 up to the commencement of the World War, the M.A.N. Co. and their licensees had built over 300 of these engines, aggregating 500,000 B.H.P. The M.A.N. Co. had by 1921 installed engines in 22 stations, three of which exceeded 27,000 B.H.P. each, six exceeded 15,000 B.H.P. each, and the remaining thirteen were all over 10,000 B.H.P. in capacity. Messrs. Thyssen & Co. have engined a power station at Bruckhausen which has a capacity of 65,000 horse-power. At the Neunkirchen Works, 14,000 H.P. is provided by *2-stroke* cycle double-acting gas blowing engines. It is stated that 2,000 H.P. per cylinder is obtained from these engines. At Heinitz, Saarbrucken, there is an installation of nine Ehrhardt-Sehmer engines, aggregating about 16,500 horse-power. The Schalke Mining Co. have three Haniel-Lueg twin-tandem engines totalling 12,000 horse-power.

Of American installations may be mentioned: The Indiana Steel Co.'s plant at Gary, Ind., where, in one engine house in units of about 3,700 H.P., is an aggregate of fully 60,000 H.P. supplied by M.A.N. type engines built by the Allis-Chalmers Co. The San Mateo Power Co. have 21,600 H.P. supplied by four 5,400 H.P. horizontal double-acting twin-tandem engines built by the Snow Steam Pump Co.; each engine thus comprises four cylinders; these are 42 in. in diameter, with a piston stroke of 60 in. and the speed is 90 revs. per minute. Thus each working cylinder supplies 1,350 horse-power. At the Carnegie Steel Co.'s Ohio works there are four very large blowing engines of 3,000 H.P. each, capable of [illegible]ling jointly with 200,000 cub. ft. of air per minute. An [illegible] installation is that (1921) at Kamata, Japan, where [illegible].N. type engines by the Lilleshall Co., Ltd., operate [illegible]very Producer gas, supply electrical energy requi[illegible] to work the railway between Tokio and Yokohama. Each [illegible]ine is direct-coupled to a 1,500-K.W. alternator the pole-pieces of which are mounted in the rim of the fly-wheel.

An idea of the size of these huge engines may be formed from the following particulars:—

The cylinders are 47½ in. in diameter and the stroke is 51½ in.; at 100 revs. per minute each engine has an output of roundly 2,500 B.H.P. The crank-pin is 23¾ in. in diameter; the crankshaft at the fly-wheel end is no less than 32½ in. in diameter; and the fly-wheel is about 22 ft. in diameter and 39·4 in. in rim-width; an illustration of this enormous wheel, which weighs about 100 tons, is given in fig. 3; its great energy of rotation reduces the coefficient of fluctuation of engine-speed at full load to less than 1/250—as required for parallel running with alternators.

Each cylinder, complete, weighs 25 tons, and each complete engine about 400 tons, including the fly-wheel.

FIG. 3.

Exact data of output during the World War and afterwards are unobtainable, but it is considered that in 1921 there was an aggregate of roundly 2,500,000 H.P. supplied by engines of the large, slow-running, tandem, horizontal, double-acting type.

*Group 1 (b).*—English designers up to 1921 had not much favoured the large water-cooled-piston double-acting engine, preferring the greater simplicity of the single-acting cylinder

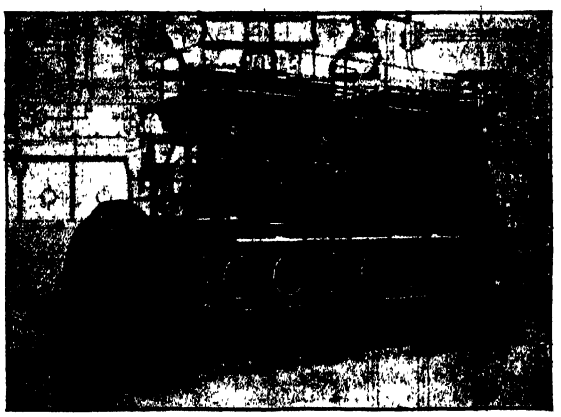

FIG. 4.

with uncooled piston; this led to the development of an important class of vertical and horizontal medium-speed single-acting four-stroke multi-cylindered engines.

The National Gas Engine Co., Ltd., of Ashton-under-Lyne, took a leading position in the development of the vertical type of this class, and in 1910 erected a special factory for their exclusive manufacture.

An illustration of a 1,500 B.H.P. "National" vertical gas engine direct-coupled to an alternating current generator is given in fig. 4, while fig. 5 shows a transverse section through one of the six pairs of cylinders. It will be seen that this 1,500 B.H.P. engine comprises twelve cylinders arranged in six vertical tandem single-acting pairs AA and BB respectively (fig. 5); the pistons EE are rigidly connected together by a stout piston rod, and from the lower piston the six-throw crankshaft D is driven through a connecting-rod CC. The lower part of the upper cylinder AA is closed, and in this air is compressed during the downward stroke of the pistons thus "softening" the running. The engine works on the four-stroke cycle, and the inlet and exhaust valves and gas, air, and exhaust passages are clearly indicated. These engines work on coal gas, Producer gas, coke oven gas or blast furnace gas, and no explosive mixture exists outside the engine itself. The cylinders are well water-jacketed, but the pistons, though not water-cooled, are so designed as to facilitate the conduction of the heat away from their crowns to the surrounding cylinder walls.

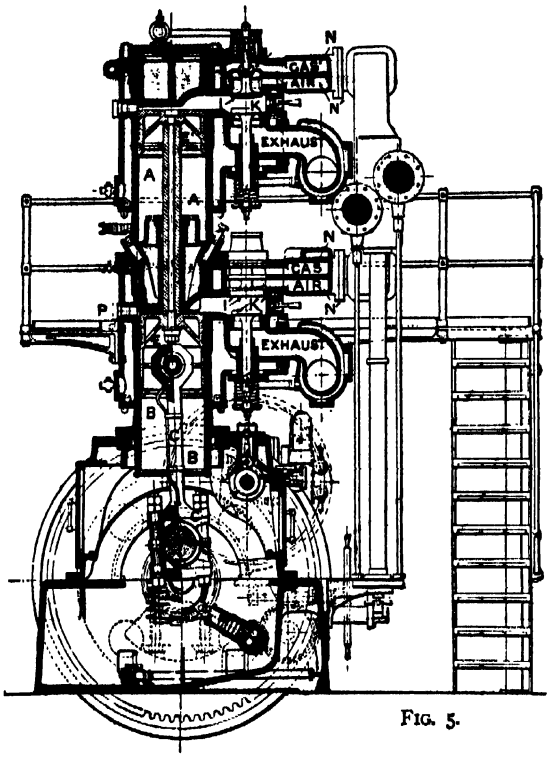

FIG. 5.

Engines of this type are built in a series ranging from a 4-cylinder two-crank design of 300 B.H.P. running at 300 revs. per minute to a 12-cylinder six-crank design of 1,500 B.H.P., 200 revs. per minute.

Many fairly large plants had by 1921 been installed, among which may be mentioned one of 11,500 H.P. at Palmer's Shipbuilding Co., Ltd., Jarrow; one of 11,000 H.P. at the Government Factory, Lanquith; one of 10,500 H.P. at the Partington Steel Co.'s Works, Irlam, near Manchester; and one of 4,500 H.P. for the Midland Coal & Iron Co., Ltd.

As a typical example of the horizontal type of multi-cylindered single-acting large gas engine, the design adopted by the Premier Gas Engine Co., Ltd., of Sandiacre, Notts., is taken. An important installation of this type is that of the Hoffmann Mfg. Co., Ltd., at Chelmsford, which commenced operations in March 1919.[1]

This installation comprises six 500 B.H.P. four-cylinder four-crank horizontal Premier engines running at 190 revs. per minute, each direct-coupled to a 360 K.W.-generator; thus here 3,000 H.P. is produced from 24 cylinders. Gas is supplied by a Lynn pressure producer plant with ammonia recovery. An examination of the results of six months' working in ordinary service showed that the overall thermal efficiency of this plant, i.e. the ratio of heat of electrical energy to heat of coal supplied, had the very high value of ·199, *i.e.* 19·9 %.

*Group 2. Medium-powered Gas Engines.*—Included in this group are the very numerous engines principally of the single-cylindered four-stroke horizontal single-acting type using coal gas or Suction Producer gas as fuel, and employed for a great variety of purposes by the smaller class of power consumers. In H.P. they range from 2 or 3 up to (two-cylindered) designs of about 300. Messrs. Crossley Bros., Ltd., of Manchester, produce annually a large number of engines of this type in a series ranging from 3½ H.P. to 260 H.P.; up to the end of 1920 this firm alone had built over 80,000 of these engines.

Many other important firms and companies are also engaged in this industry, among whom may be mentioned Messrs. Brotherhood, Browett-Lindley, The Campbell Co., Davey Paxman & Co., Fielding & Platt, Gardner, Grice, Hindley, The National Co., The Premier Co., Ruston & Hornsby, The Stockport Co., Tangye, The Brit. Westinghouse Co., etc.

A typical combination of Suction Producer and gas engine is illustrated in fig. 6. Through an incandescent zone of anthracite or coke contained in the Producer or "Generator" a mixture of air and steam is drawn by the suction of the engine when at work. This air and steam in passing through the hot zone is decomposed, and issues from the generator as a very hot, smoky mixture consisting mainly of nitrogen, carbon monoxide, carbon dioxide, and hydrogen. A rough average composition by volume is as follows: nitrogen 55 %; carbon monoxide 22 %; hydrogen 15 %; carbon dioxide 6 %; miscellaneous hydrocarbons, free oxygen, etc., 2 %.

Such a mixture of gases is termed "Producer Gas" and has a (lower) calorific value of 125 to 130 B. Th. U. per cub. ft.; about 200,000 cub. ft. are produced per ton of anthracite consumed.

The hot and smoky gas in the case illustrated passes first through a chamber fitted with a baffle plate, and water-sealed at the bottom; here the grosser impurities are deposited; thence it goes past a 2-way valve which permits its escape through a chimney into the atmosphere when the engine is at rest; when running, however, the gas is drawn by the engine suction through a large cylinder filled with small coke over which a spray of water is constantly played. This is termed the "coke scrubber," and here the gas is cooled and freed from dust and tarry impurities; thence finally it passes into a reservoir, and so to the engine.

The illustration shows in section the normal type of horizontal 4-stroke cycle engine fitted with one or two massive fly-wheels which by their momentum maintain the required degree of uniformity of rotation of the crankshaft.

*Vehicle and Marine Applications.*—In 1918–21 attention was again given to the problem of propelling motor road vehicles by small producer-gas engines, and a certain measure of success was obtained by Mr. D. J. Smith and others' experiments were in 1921 being continued.[2]

*Marine Producer-Gas Engines.*—In 1904 Herr Capitaine fitted a tug at Frankfort-on-Main with a 70 H.P. engine and anthracite producer plant. In 1905 Messrs. Thornycroft fitted the launch "Emil Capitaine" with a 60 H.P. engine and producer, and, later, the barge "Duchess" with a similar 30 H.P. plant.

In 1908 Messrs. Beardmore fitted H.M.S. "Rattler," 715 tons displacement, with an experimental 500 H.P. gas engine running at 120 revs. per minute on gas supplied by an anthracite producer. In 1910 the sailing boat "Castell san Nicolan" was fitted with an auxiliary 60 H.P. Gardner anthracite suction power plant.

The principal difficulty encountered with marine suction-gas plants was in obtaining efficient manœuvring power; progress was made, though slowly, and it is of interest to record that the first producer-gas-engined ship crossed the Atlantic in 1919. The largest marine producer plant in 1921 was that of the American vessel "Wilhelmina," and comprised a 350 B.H.P. engine supplied by two suction gas producers.

The Dutch "Van Rennes" producer-gas engines, built in sizes up to a maximum of 200 H.P. have been fitted to a number of small cargo-boats employed in coastal service; these engines are readily reversible, and it is claimed that their fuel consumption is, roundly, 1 lb. of anthracite per H.P. hour.

A good class ocean-going cargo steamer may be taken as of about 8,000 tons dead weight, with steam engines of about 2,000 I.H.P. running at 65 revs. per minute and using 1½ lb. of coal

[1] For details see Patchell, *Journ. Inst. of Elec. Engrs.*, June 1920.

[2] Vide *Proc. Inst. Auto. Engrs.*, xiv., 1919-20.

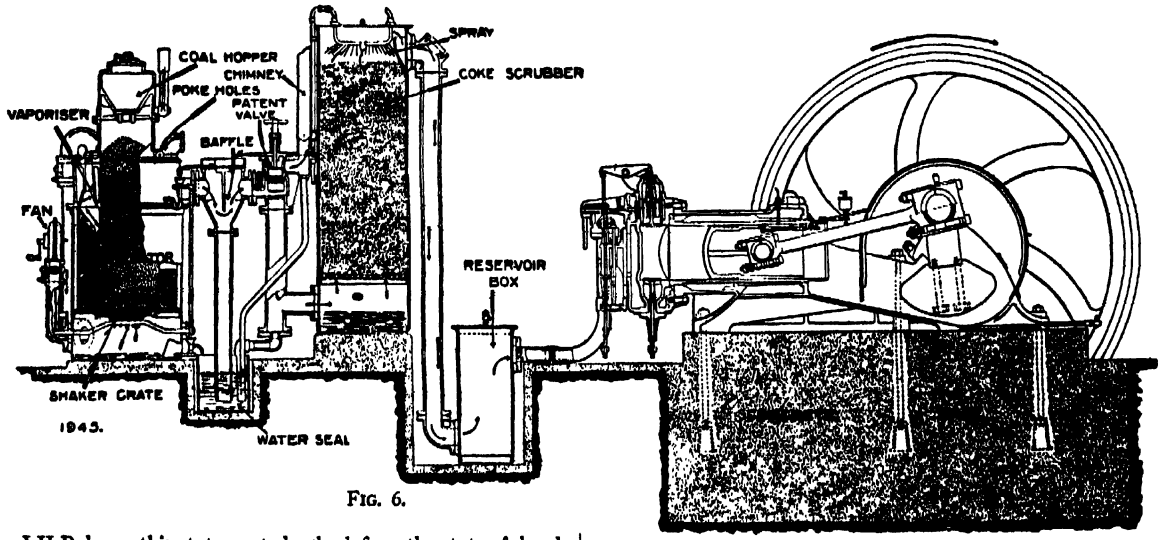

FIG. 6.

per I.H.P. hour; this statement clearly defines the state of development of the marine producer-gas engine in 1921.

*Group 3 (a). Diesel Engines.*—The Diesel engine has now become established as a reliable prime-mover, having a very low consumption of fuel. A typical illustration is in fig. 7.

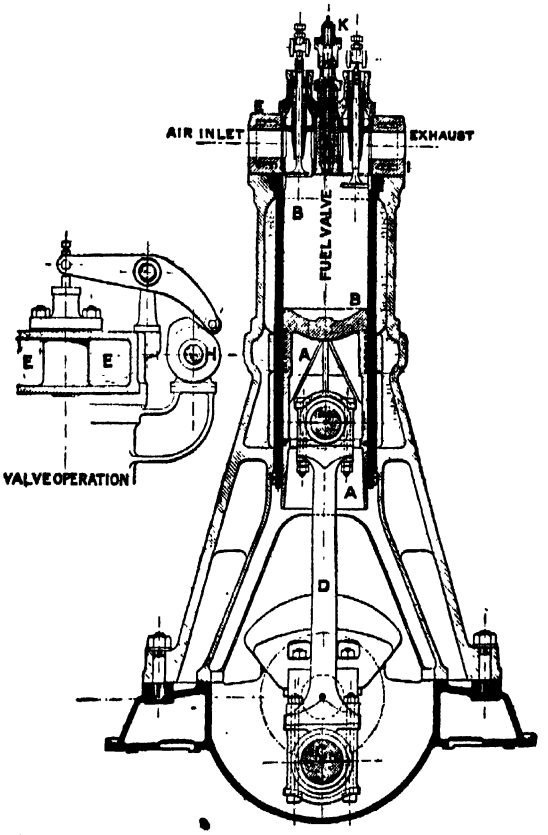

FIG. 7.

Within a very strong water-jacketed cast-iron cylinder BB slides a long, heavy cast-iron piston AA driving a crankshaft C by means of the connecting-rod D. The cylinder head EE is a deep, well water-jacketed casting containing four valves, viz. the air inlet, fuel inlet, exhaust, and air starting valve; the latter is not shown.

On the downward stroke of the piston air only is drawn into the cylinder through the air inlet valve; during the following upward stroke this air is compressed to a pressure of 450 to 500 lb. per sq. in. with accompanying great rise of temperature. At or near the moment of greatest compression, and continued during the first 20° to 30° of crankshaft revolution, the necessary small charge of fuel oil is blown—in the form of a very fine and uniformly diffused mist—into this compressed and heated air. Spontaneous ignition or "explosion" of the mixture instantly takes place, but the fuel supply is so regulated that the pressure is but little, if at all, increased by the explosion, the end aimed at being to cause combustion to take place at as nearly as possible constant pressure; a typical diagram is reproduced in fig. 8.

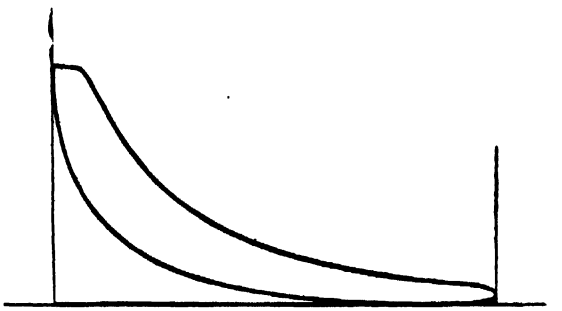

FIG. 8.

On the cessation of the fuel injection the exploded charge expands at rapidly falling pressure during the working stroke; towards the end of this stroke the exhaust valve opens, and continues open until the completion of the succeeding up-stroke, the burnt gases thence escaping into the atmosphere; this completes the cycle. The engine is thus of the "four-stroke" type, receiving one working impulse in each two revolutions of the crankshaft, the order of operations being (1) suction of air; (2) compression of air; (3) working stroke; (4) exhaust.

The valves are operated by rocking levers actuated from a half-speed overhead cam-shaft H, driven from the crankshaft.

Compressed air reservoirs—primarily charged and thenceforward maintained by the engine itself—containing air stored at a pressure of from 750 to 1,000 lb. per sq. in., are used for starting the engine, and providing the air blast for the fuel oil injection into the cylinder.

Many Diesel engines are also built operating upon the 2-stroke cycle, and fig. 9 shows a typical design in section.

Here there is no exhaust valve, but towards the end of the down-stroke the piston over-runs exhaust ports AA formed in the cylinder walls whence the burnt gases escape into the atmosphere. Simultaneously an air pump, operated by the engine, delivers a charge of fresh air at a pressure of 3–5 lb. per sq. in. into the cylinder through an air valve, or valves, in its head. This air hastens the discharge of the burnt gases, and is compressed on the return up-stroke of the piston at or near the end of which the fuel oil is injected, as before, and the working stroke then follows. This type has been largely developed by Carels Bros. of Ghent; it will be noted that every down-stroke is a working stroke, but due to the less perfect scavenging of the exhaust, and to the power absorbed by the air pumps, the power output is found to be only from 1½ to 1¾ times that of an equal

4-stroke cycle engine instead of twice as much as would be realized in an ideal case.

A second type of 2-stroke Diesel engine, specially developed by Sulzer Bros. of Winterthur, is valveless excepting for the fuel injection valve and air starting valve. In this type fresh air, at slight pressure, enters through ports on one side of the lower part of the

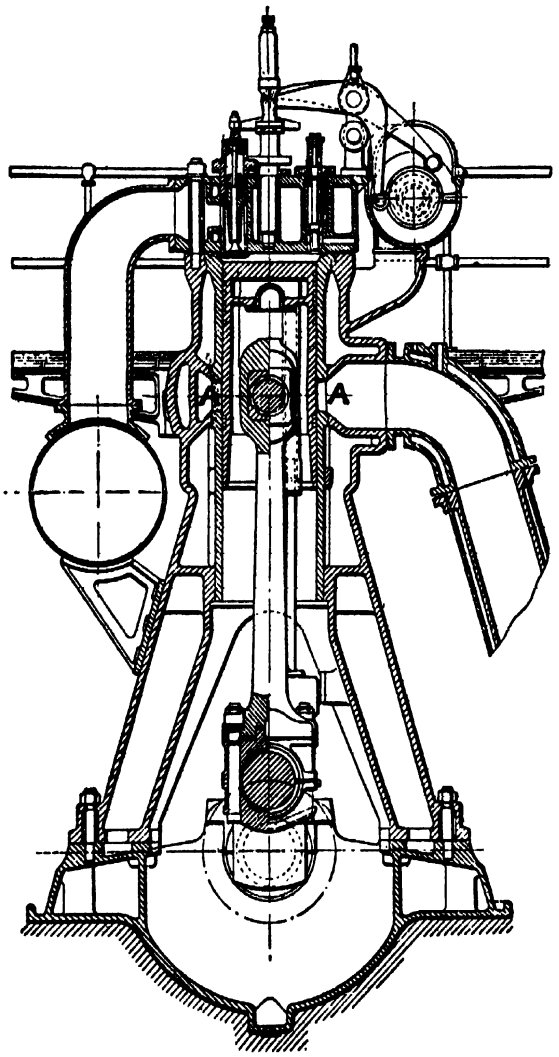

FIG. 9.

cylinder at the same time that the burnt gases are escaping through ports on the other side, substantially as in the small two-stroke Day-type petrol engine, but without crank-chamber compression, as described later (see fig. 13). The fuel consumption of the 4-stroke cycle Diesel is roundly 0·4 lb. per B.H.P. hour, and of the 2-stroke of either type about 0·45 lb. per B.H.P. hour.

*Land Installation of Diesel Engines.*—Steady progress was made between 1910 and 1921, and at the end of 1920 upwards of 100 plants existed in the United Kingdom of capacity ranging from 50 to 6,000 B.H.P., and aggregating more than 50,000 B.H.P. Outside England more than twenty important installations had by 1921 been erected, or extended, aggregating fully 25,000 B.H.P.; these are spread over the world, being found in Egypt, India, Ceylon, Burma, Malay States, Hong-Kong, S. Africa, Australia and N. and S. America. The principal makers in Great Britain are Mirrlees, Bickerton, & Day; Willans & Robinson; Hick, Hargreaves & Co.; The Brit. Westinghouse Co.; Swan, Hunter & Wigham Richardson; and Thornycroft.

Noteworthy installations are (1) that of the Charing Cross & City Electricity Supply Co., Ltd., London, which includes ten Sulzer Diesel engines aggregating 6,000 B.H.P. Of these, four are of 500 B.H.P. and four of 600 B.H.P. 3-cylinder engines, all running at 150 revs. per minute: the remaining two are 4-cylinder 800 B.H.P. engines running at 150 revs. per minute; this installation was completed in 1912. (2) At the Southend-on-Sea Electricity Works there is a total of 3,900 B.H.P. supplied by two high-speed 6-cylinder Koerting Diesel engines of 450 B.H.P. each, running at 450 revs. per minute, and four 750 B.H.P. 6-cylinder "M.A.N." Diesels running at the same speed; these engines commenced running in 1920. (3) At Letchworth, Herts, the Electricity Supply Station contains six Diesel engines aggregating 1,900 B.H.P.; the first of these commenced work in 1910 and the sixth in 1916. (4) The great majority of Diesel engines are of the inverted vertical type; an interesting exception is that of the plant at Kingston-on-Thames Electric Power Station where are installed one 400 B.H.P. 4-cylinder 4-stroke M.A.N. *horizontal* Diesel engine running at 190 revs. per minute, and one 500 B.H.P. 2-cylinder, 2-stroke M.A.N. *horizontal* Diesel running at 165 revs. per minute; these engines commenced work in 1913. Of large installations outside England may be mentioned that of the Hong-Kong Electric Co. with an aggregate of 3,060 B.H.P. supplied by seven Sulzer Diesel engines; the first of these, two 3-cylinder engines each of 300 B.H.P., started work in 1908, and the last two—of 4-cylinder 540 B.H.P. each—in 1914. An external view of a 500 B.H.P. 4-cylinder, 4-stroke standard Diesel engine is shown in fig. 10.

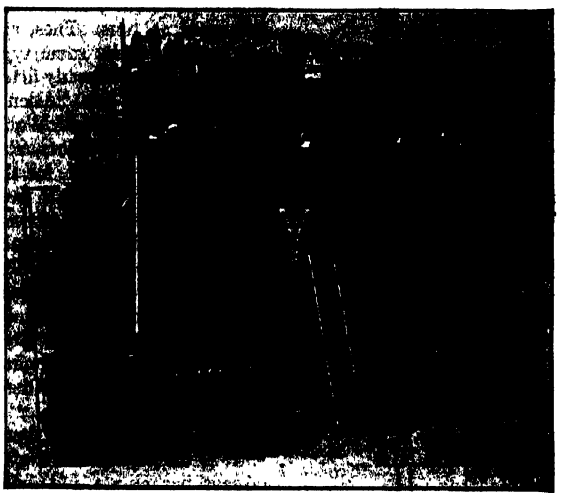

FIG. 10.

*Marine Diesel Engines.*—Marine Diesel engines differ in no essential respect from the land type. The majority of Diesel-engined vessels existing at the end of 1920 were fitted with 4-stroke cycle crosshead type engines largely on account of the known reliability of the 4-stroke engine in land installations. Two-stroke Diesel engines were at first made with cast-steel cylinder covers which not infrequently failed by cracking; this difficulty has been entirely overcome by making the cylinder covers of a suitable grade of cast iron, and the single-acting 2-stroke engine will probably become the preferred type.

For the very large engines required by war-ships the double-acting 2-stroke design is most suitable, and several had already been built in 1921 though there was not yet an instance of one fitted in a vessel; the cooling problem had not yet been quite satisfactorily solved. The 2-stroke engine possesses the advantages of reduced weight, reduced space occupied, greater simplicity in reversing gear, and lower first cost as compared with the 4-stroke type. Up to the end of 1920 a maximum of 1,800 H.P. had been attained in a single-acting, and 2,750 H.P. in a double-acting 2-stroke Diesel cylinder.

The first ocean-going passenger ship propelled by Diesel engines was the East Asiatic Co.'s 12-knot boat "Selandia," carrying a dead-weight cargo of about 7,400 tons, Copenhagen to Bangkok. There were twin screws each driven at 140 revs.

per minute by an 8-cylindered single-acting 4-stroke Diesel engine of crosshead type, aggregating 2,500 indicated H.P.; the first voyage was made in Feb. 1912. The sister ship "Christian X." was similarly engined. In May 1913 the largest Diesel-engined vessel afloat was the "Siam," built and engined by Burmeister & Wain, at Copenhagen, having a displacement of 13,200 tons; this boat is fitted with two 4-stroke engines aggregating 3,150 I.H.P., twin screws, and attained 12·4 knots on her trial run.

The great success of the geared steam turbine has made it a formidable competitor of the marine Diesel engine; nevertheless, steady progress continues to be made, and it is noteworthy that some of the largest British engineering and shipbuilding companies were in 1921 engaged in Diesel-engined ship production. Thus, during 1920, Messrs. Harland & Wolff launched seven ocean-going Diesel ships, viz. five at Glasgow, one at Greenock, and one at Belfast; while Messrs. Barclay Curle, Doxford & Vickers also built one each—ten in all; and in the United States five or six large oil-tankers with Diesel engines were also built.

In May 1921 there were in hand in Great Britain among others: (1) A large vessel for the Ocean Steamship Co., Liverpool, of 15,000 tons displacement and 13 knots speed; this was to be fitted with two large 8-cylindered Diesel engines by Burmeister & Wain, each developing 3,200 I.H.P.; the daily fuel consumption was estimated not to exceed 20 tons. These engines were of the same type and size as those already fitted in four 14,000-ton "Glen" liners built by Harland & Wolff; (2) two 14,000-ton boats, also by Harland & Wolff, for the Holland-America line, in each of which twin-screw Diesel machinery aggregating 6,400 I.H.P. was to be installed of the same design as those in the Ocean Company's liner; (3) The British India Co.'s vessel "Domala" with engines by the North British Diesel Co.; these were 8-cylinder 4-stroke engines of 26½-in. bore, and 47-in. stroke running at 96 revs. per minute, and giving about 2,350 I.H.P.; this was the first large Diesel-engined passenger liner.

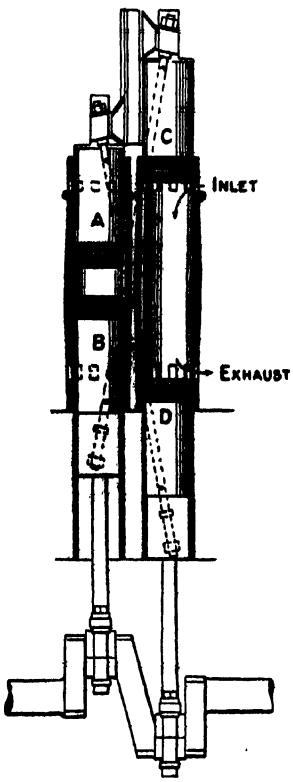

FIG. 11.

Great attention was in 1921 being devoted to improved designs, and some very interesting Diesel engines of special type had recently appeared. Thus Messrs. Doxford had produced a 2-stroke inverted vertical 3,000 H.P. engine of the "Oechelhauser" 2-piston type. Messrs. Cammell Laird have developed the "Fullagar" engine for marine use; this is a modified Oechelhauser made in "units" each comprising two Oechelhauser cylinders placed side by side (fig. 11) with their pistons connected diagonally by long tie-rods as indicated; the obliquity of the rods is small, and the side thrusts are resisted by the cross-heads and guides shown above A and C in the illustration.

The Cammell Laird-Fullagar engine works on the 2-stroke Diesel cycle, the oil fuel being injected between the pistons near the point of maximum compression by a high-pressure air blast; as the inlet and exhaust ports are at opposite ends of the cylinders excellent scavenging is obtained.

This engine is light and low in cost relatively to its power output; it is of high thermodynamic efficiency; and the frame is almost wholly relieved from stress in working. The 1,000 H.P. marine engine comprises two "units," *i.e.* four open-ended tubular cylinders, eight pistons, and a 4-throw crankshaft. The cylinders are 18½ in. in diameter, the stroke of each piston is 25 in., and the engine runs at 110–115 revs. per minute.

Two of these engines had by 1921 been installed in a cargo vessel for Messrs. Brocklebank; trials made in April 1921 were said to have shown the extremely low consumption of only 0·39 lb. of oil per B.H.P. hour. These engines drive their own 3-stage air compressors, scavenging pumps, and circulating water and lubricating oil pumps.

A 4,000 H.P. marine engine of this type was in May 1921 being built by Messrs. Cammell Laird, in a 4-cylinder unit; each cylinder is 26 in. diameter, stroke 42 in., and speed 90 revs. per minute.

Messrs. Swan, Hunter & Wigham Richardson had also recently produced a design of 2-stroke 4-cylinder "Neptune-Diesel" engine of special type.

The F.I.A.T. Co. (Turin) were building large 2-stroke Diesels in sizes up to a 6-cylinder marine type developing 3,200 H.P.

A large number of small multi-cylindered quick-revolution Diesel engines were fitted in submarines during the war by Thornycroft, Vickers, White, etc. This class includes engines having up to 12 cylinders, and run usually at from 400 to 500 revolutions per minute. They are now built in power up to 1,300 B.H.P., frequently with 8 cylinders, of both 4-stroke and 2-stroke type.

*Group 3 (b). Semi-Diesel Engines.*—Within the period 1910–21 a large group of engines appeared, which it has become usual to term "semi-Diesel" engines. The very high compression pressure of the normal Diesel engine necessitates not only a heavy and costly design but in addition the maintenance of an extremely high pressure in the air reservoirs for supplying the fuel oil blast. Designers have accordingly devoted considerable attention to the problem of producing engines (1) having a lower compression pressure than the Diesel engine, and (2) avoiding the necessity of high pressure air blast reservoirs by injecting the fuel oil into the cylinder by mechanical means through an "atomizer," or spraying device. Great success has been attained with but little sacrifice in fuel consumption efficiency.

In March 1919 the Diesel Engine Users' Association adopted the following useful definitions of Diesel and semi-Diesel engines respectively:—

*Diesel Engine.*

"A Diesel engine is a prime mover actuated by the gases resulting from the combustion of a liquid or pulverized fuel injected in a fine state of subdivision into the engine cylinder at or about the conclusion of a compression stroke. The heat generated by the compression to a high temperature of the air within the cylinder is the sole means of igniting the charge. The combustion of the charge proceeds at, or approximately at, constant pressure."

*Semi-Diesel Engine.*

"A semi-Diesel engine is a prime mover actuated by the gases resulting from the combustion of a hydrocarbon oil. A charge of oil is injected in the form of spray into a combustion space open to the cylinder of the engine at or about the time of maximum compression. The heat derived from an uncooled portion of the combustion chamber, together with the heat generated by the compression of the air to a moderate temperature, ignites the charge. The combustion of the charge takes place at, or approximately at, constant volume."

In the semi-Diesel engine definition it will thus be seen that there is no limitation made as to the mode in which the charge of fuel oil is injected, and that the essential features are (1) the practically instantaneous introduction of the fuel oil charge, giving approximately a "constant volume" explosion; and (2) the use of a "hot bulb" for aiding vaporization and ignition, whence these engines are sometimes styled "Hot-bulb Diesels." As the "Hot-bulb" engine was invented by Mr. Stuart Akroyd (1886–90), the "Akroyd-Diesel" would have been a more appropriate name for this class of engine.

Nearly all recent semi-Diesel engines are of the two-stroke type with mechanical or "solid" injection of the fuel oil, *i.e.* no high-pressure air blast; a usual device comprises a small force-pump operated by a quick-acting or "steep" cam which causes the small charge of oil delivered by it to forcibly raise a spring-closed needle valve in the spraying nozzle through from 0·01 to 0·02 of an inch; the charge of oil thus enters the hot-bulb in the form of a well-diffused fine spray. Several recent designs include simple air compressors whose function it is to supply an air jet to improve cylinder scavenging and assist in the cooling of pistons and cylinder walls, thus rendering recourse to the somewhat crude "cylinder water-drip" unnecessary during prolonged full-load running.

An instructive series of diagrammatic sections through nine representative semi-Diesel designs is given in fig. 12 [1]; seven of the engines are of the two-stroke type, the "hot-bulb" being shown.

[1] By kind permission of The Diesel Engine Users' Association.

A critical examination of the type will be found in a paper by Mr. J. Richardson read before the Diesel Engine Users' Association on Oct. 25 1918, and reproduced in *Engineering* of the same date.

Messrs. Beardmore were in 1921 building this type of engine up to 600 B.H.P. and were considering a design to give 1,000 B.H.P.

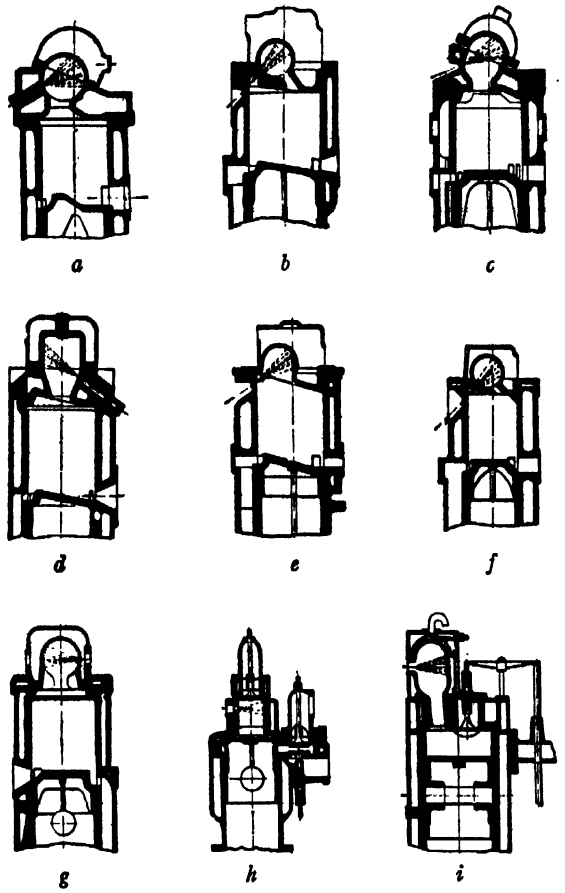

FIG. 12.—*Two-stroke Cycle:*—(*a*) "Beardmore," (*b*) "Bolinders," (*c*) "Petter," (*d*) "Ailsa Craig," (*e*) "Campbell," (*f*) "Kromhout," (*g*) "Robey." *Four-stroke Cycle:*—(*h*) "Cross," (*i*) "Hein."

The Swedish "Bolinders" engine (agents, Messrs. James Pollock & Sons, London) has for years been successfully and largely applied to the propulsion of fishing-boats and coastal craft. As early as Dec. 1911 the small (65-ft.) vessel "Lingueta," fitted with a 30-H.P. Bolinders engine, ran from Weymouth to Pernambuco (Brazil). In 1912, the vessel "Isleford" was fitted with a 4-cylinder 320-B.H.P. Bolinders engine; one of the latest cases (1921) is that of the Duke of Westminster's yacht "Belem," propelled by two 4-cylinder Bolinders engines each of 240 B.H.P. Of this type alone it is stated that over 650,000 B.H.P. had already in 1921 been supplied for various services; and as many other firms build 2-stroke semi-Diesels, the aggregate of this type must reach a very high figure.

The 2-stroke Petter semi-Diesel is also now largely employed in land service.

Semi-Diesel engines are becoming increasingly frequent on account of their simplicity, relatively low cost, and ability to use as fuel, with good economy, most of the heavy petroleum fuel oils varying from 0·8 to 0·9 in specific gravity and 130° F.–250° F. in flash point; the range at present is thus from ordinary kerosene to Texas fuel oil.

Semi-Diesel engines are usually started by compressed air stored in reservoirs at about 200 lb. per sq. in.; prior to starting the hot-bulb is blow-lamp-heated for 10 to 15 minutes.

*Group 3 (c). Hornsby-Akroyd, and Normal Heavy Oil Vaporizer-type Engines.*—There is no change of any fundamental importance to record regarding this group; mostly of the single-cylindered horizontal type, their use is established in many cases where the requirements call for only comparatively small powers.

*Group 4. Quick-revolution "Light Oil" Engines.*—This group includes the "Petrol Motors" now universally applied to the propulsion of road vehicles of all types, motor launches, aircraft, and small miscellaneous services.

Invented by Gottlieb Daimler, about 1887, and first applied seriously to road transport by Messrs. Panhard & Levassor, 1890, that modern miracle the "Petrol Motor" had in 1921, in the short space of thirty years, profoundly affected the conditions of civilized life in both peace and war. Distributed now over the whole world it is, *par excellence*, *the* motor for the multitudinous daily wants of humanity where large power is not required, and on land, in the air, on and under water, in agriculture, domestic service, and in the miscellaneous smaller departments of industry it finds universal application. Not the least remarkable of the features of these wonderful little engines is their high thermal efficiency, as much as 28% of the whole heat of the petrol not uncommonly being obtained at full load.

In his presidential address to the Inst. of Auto. Engineers in 1910, Dr. F. W. Lanchester stated that the 4-cylindered and 6-cylindered petrol engine had even then reached a degree of perfection that would have been regarded as impossible of attainment at the commencement of the century; the weight per H.P. developed at full load had been reduced from about 30 lb. to 9 to 12 lb. only (exclusive of fly-wheel); he commented also upon the absence of vibration and efficient silencing of the 1910 engines. Car engines of 1910 were, with few exceptions, of the 4-cylindered vertical type, with bore ranging from 3 to 5 inches, stroke from 3 to 6 inches, and speed, when developing 90% of their maximum power, of from 750 to 1,500 revolutions per minute, the corresponding brake mean effective pressure ranging from 65 to 95 lb. per sq. in. approximately. Compression pressures employed were from about 70 to 120 lb. per sq. in., absolute. Very full details will be found tabulated in the *Proc. Auto. Engineers* for 1910–11, vol. v., pp. 180 *et seq.*

Between 1910 and 1921 the advance made was purely in refinements of detail, with no change in leading principles of action. Six-cylindered engines for road vehicles show a slight increase in number; and in smaller and lower-priced cars, due to post-war cost increases, there has been some tendency observed to the production of two-cylindered horizontal, or "V," car engines, a few of these being of the air-cooled type. The 4-cylindered vertical engine, water-cooled, still largely predominates, as is shown by the following analysis of engines fitted to motor vehicles exhibited at Olympia in the autumn of 1920:—

*Engines of Motor Vehicles, 1920.*

| Number of Cylinders | Number of Engines | Per cent of Engines |
|---|---|---|
| 2 | 25 | 8·3 |
| 4 | 203 | 67·5 |
| 6 | 59 | 19·6 |
| 8 | 13 | 4·3 |
| 12 | 1 | 0·3 |
| | 301 | 100·0 |

Of these 301 engines, 292 were water-cooled and only 9 air-cooled.

The provision of detachable heads is a noteworthy improvement in design. In 1910 they were almost unknown; in 1920, of the 301 engines examined, 133 had detachable heads. Valve location has undergone but little change, 227 engines in 1920 having the usual side-by-side arrangement; the overhead valve type showed a small increase, 48 engines being thus arranged. Sixteen engines had sleeve valves, six engines valves on opposite sides of the cylinders,—involving two cam-shafts, and four with the inlet valve vertically over the exhaust. The exceedingly reliable high-tension magneto ignition still predominated, 247 engines being thus fitted; the remainder had either battery ignition or a combination of both H.T. and battery.

The revival of battery ignition is a consequence of the introduction of the very convenient electrical self-starting equipment with which so many vehicles are now supplied;[1] of 262 cars examined in 1920 no fewer than 245 were thus equipped. Recent improvements in H.T. magneto designs enable these machines to "spark" at very much reduced speeds; Messrs. Young & Warren[2] mention a magneto which will spark regularly across a 5·5-mm. air gap at about 60 revs. per minute only, with the timing lever fully advanced.

[1] For a valuable review see *The Autocar* for Oct. 23 1920.

[2] *Proc. Inst. Auto. Eng.*, 1919–20, p. 374.

With improvements in the H.T. magneto, the recently introduced American "Impulse Starter" may be found to prove a simple, compact, and low-priced solution of the starting problem; briefly, this comprises a spring introduced between the engine and magneto and so arranged that on turning the starting handle the spring is at first wound up, the magneto armature remaining stationary. At an arranged instant the locking device is released, and the armature at once "flicks over" very suddenly, thus producing an intense igniting spark.

*Fuels.*—Petrol was still in 1921 the principal fuel, though benzol, either alone or mixed with petrol in varying proportions, is now used so far as available; alcohol had not yet come into use, though great efforts were being made to render it generally available. Mixtures of petrol and benzol, or benzol alone, can be used in existing engines usually with no change in adjustment, but with alcohol special designs will become necessary. The cost of petrol to the consumer rose steadily—largely due to the war—from 1910 to 1921. In 1910 the price per gallon in the London district was 9d. and 6d. tax, total 1s. 3d.; in August 1920 it rose to the very high figure of 4s. 3d.; by June 1921 it had fallen to roundly 3s. This great increase, added to the heavy vehicle taxation of £1 per Treasury-rated horse-power (= 0·4 × Bore² × No. of Cyls.) tended to some extent to discourage the use of the private motor vehicle, but this might be regarded as a temporary check only.

The motor-cycles of 1921 may be considered to have nearly attained perfection; swift, comfortable, very economical of fuel, reliable, fitted often with 3-speed gears, "kick" starter, free engine, electric lighting, and many other refinements, they were veritably "cars" in miniature, and continually increased in favour with the motoring public of all ages. In 1920 no fewer than 186,200 licences for motor bicycles were taken out in Great Britain alone.

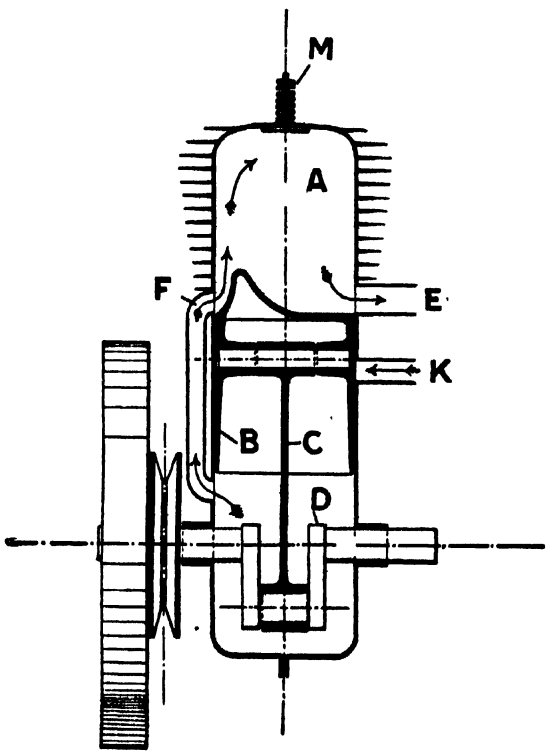

FIG. 13.

A great increase is also observable in that singular, though convenient, makeshift vehicle—the motor-cycle and side-car; this is probably largely attributable to the prevailing high cost of cars. With hardly an exception, motor-cycle engines are all air-cooled; the principal feature of note is the large increase in the number of engines of the 3-port 2-stroke type; the disadvantage of a lower fuel economy than that of the 4-stroke engine is, with many riders, more than compensated for by their great simplicity and low first cost.

A diagrammatic section through one of these very useful little engines is given in fig. 13; it comprises the usual air-cooled cylinder A, piston B, connecting-rod C, and crankshaft D; the piston has a "lumped" crown to deflect upwards the entering stream of fresh mixture as indicated. The crank-chamber is completely enclosed, and to start the engine it is caused to rotate by the driver; the piston rises, producing a partial vacuum in the crank-chamber until its *lower* edge uncovers the port K when an explosive mixture from the carburettor immediately rushes in; on its downward stroke the piston first covers the port K, and thereafter compresses the charge of explosive mixture in the crank-chamber until its *upper* edge uncovers the port F when the mixture, at a slight pressure, immediately passes up the passage shown into the space above the piston. Simultaneously the used gases are discharged through the exhaust port E, which is uncovered by the piston shortly before F. On the following up-stroke the piston first shuts off the ports E and F, and then compresses the charge into the upper portion of the cylinder; at the instant of maximum compression it is exploded by a sparking plug in the usual manner, and the piston is at once driven downwards; near the end of the down-stroke the burnt gases escape through E, at the same time that the next fresh charge is entering through F, and the cycle is then repeated indefinitely. Thus every downward stroke is a working stroke; the engine is valveless; the only moving parts are the piston, connecting-rod, and crankshaft; and the engine will run equally well in whichever direction it may be started,—a feature of value in its application to small motor boats and launches which are readily reversed by slowing down the engine and then suddenly advancing the ignition.

A small compression release valve M is usually fitted in the top of the combustion chamber, which is held open by hand-operated gear to facilitate the operations of starting and stopping. In motor bicycles these engines are commonly run at from 2,000 to 3,000 revs. per minute; they are very reliable, and require no attention beyond the occasional removal of the deposit of oily carbon which forms on the piston crown and walls of the combustion chamber.

*Engines for Aircraft.*—In principle these are all high-speed petrol engines of the four-stroke or, in rare instances, two-stroke type, characterized by their extreme lightness relatively to their power output. Fig. 14 shows three standard types of engine to scale, each of 75 B.H.P., and enables relative sizes and weights to be readily compared; from this illustration the great engineering achievement embodied in the "Aero Engine" can to some extent be appreciated.

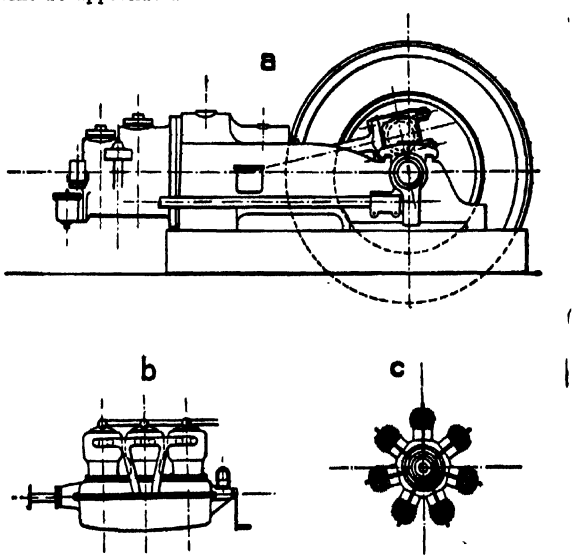

FIG. 14.—(*a*) 75-B.H.P., Single-cylinder Horizontal Engine. 200 R.P.M. Weight 200 lb. per B.H.P. Total 15,000 lb. (*b*) 75-B.H.P., 6-cylinder, Vertical, Water-cooled Aero Engine. 1200 R.P.M. Weight 5½ lb. per B.H.P. Total 410 lb. (*c*) 75-B.H.P., 7-cylinder, Rotary, Air-cooled Aero Engine. 1200 R.P.M. Weight 2¾ lb. per B.H.P. Total 205 lb.

Aero engines are conveniently grouped in five classes, viz., Horizontal Engines, Radial Engines, Diagonal or "V" Engines, Vertical Engines, and Rotary Engines. The horizontal aero engine is now obsolete. A classification of seventy-six aero

engines in 1910 by Burls[1] showed that 10 were horizontal, 12 radial, 25 diagonal, 24 vertical or "straight" and 5 rotary. With few exceptions the horizontal, diagonal, and vertical engines were water-cooled, the radial mostly air-cooled, and the rotary all air-cooled. Horse-power ranged from 15 to 130, but in aeroplane service from 60 to 120 was usually found. The weight per B.H.P. even in 1910 ranged from slightly under 2 lb. in the "Gnome" type of engine, illustrated in fig. 15, to as much as 7 lb. in water-cooled types in the remaining classes.

In July 1919, Lord Weir of Eastwood[2] gave a table (*see* above) of data relating to current typical British aero engines; it will be seen that vertical, rotary, radial and diagonal designs are all represented, the last-named predominating. The largely increased power of the 1919 engines is noteworthy; in 1910 the practical maximum used was about 130; in Lord Weir's table the maximum is 610 B.H.P. The 1919 engines show also a very satisfactorily low consumption of petrol and lubricating oil.

Considerable reduction has also been effected in the weight per B.H.P. of the water-cooled diagonal-type engines, which range from 3¼ lb. down to only 2½ lb. In the engines of 1910 the average piston speed was, roundly, 1,100 ft. per minute; the average of the eight engines in the above table is roundly 1,800 ft. per minute, a substantial and noteworthy increase.

The power of aero engines is usually stated at ground level; with increase of altitude the power output diminishes owing to the lessened density of the air; if at ground level a full power of 100 H.P. be obtained, at 5,000 ft. elevation this falls to about 82, and at 10,000 ft. to only about 68. To provide for this loss some aircraft engines have been designed for partly throttled running only at ground level, full throttle being only used when working in rarefied air at a suitable altitude; in these engines large compression ratio and forced induction are usually adopted, and full power output is never attempted at the ground level. In other cases a blower is provided to deliver additional air to the cylinders at high altitudes; exhaust-driven turbines of high efficiency have been developed by Rateau for this supercharging; by this means a nearly constant pressure may be maintained in the cylinders at the end of the suction stroke, with consequent constant power output at all heights.

In radial, as in rotary, engines a star-wise arrangement of the cylinders is adopted, all the pistons operating upon one or two cranks only, but the cylinders are stationary and the crankshaft rotates. Designs have appeared including 3, 5, 7, 9, 10 and 14 cylinders, the two last in two planes.

The 9-cylindered air-cooled radial engine of the Cosmos Co. developed 450 H.P. with the extremely low weight of but 1·47 lb. per horse-power; but large radial engines are open to objection on account of the increased head resistance involved in their use. With vertical or "straight" engines, *i.e.* those in which the cylinders are arranged as in the normal motor-car engine, weight per horse-power is found to diminish up to about four cylinders; thereafter, the larger crankshaft and heavier crank-case necessary to provide adequate stiffness tend to cause the weight per horse-power to increase; designers have accordingly associated cylinders together in two or more rows, and the "diagonal" engine with two or more pistons operating on each crank-pin is thus frequently met with in recent high-powered engines.

Weight is also saved and mechanical efficiency increased by operating the valves directly from overhead cam-shafts. Aluminium alloys are also largely used for pistons and cylinders, the latter being fitted with thin steel or cast-iron working barrels.

In their 450-H.P. engine Messrs. Napier have *three* rows each of four cylinders,—twelve in all,—three connecting-rods being attached to each crank-pin; the weight is thus reduced to only 2½ lb. per B.H.P. "wet."

The latest design of this form in 1921 was a sixteen-cylindered 1,000-H.P. aero engine, illustrated in external view in fig. 16 (Plate). In this engine there are *four* rows or "banks," each of four cylinders; the cylinders are separate, each being machined from a solid steel forging, with water-jackets formed of light steel pressings welded on.

The vertical angle between the axes of the cylinder rows is 52½°, side angle 90°, and angle at base 127½°; the engine may be regarded as formed of two eight-cylinder 90° diagonal engines placed back-to-back and jointly actuating a "flat four-throw" crank-shaft, with

[1] "Aero Engines," G. A. Burls (Charles Griffin).
[2] *Proc. of N.E. Coast Inst. of Engineers and Shipbuilders.*

four pistons operating upon each crank-pin. The angular arrangement adopted is considered by the builders to give the most convenient sequence of working impulses. Two exhaust and two inlet valves are provided in each cylinder head, placed at such an angle that the combustion chamber is approximately spherical in form; each row of cylinders has its own overhead half-speed cam-shaft operating the valves through rockers. Four carburettors are fitted, mounted on facings on the front (propeller) end of the crank-case. Ignition is by four high-tension magnetos.

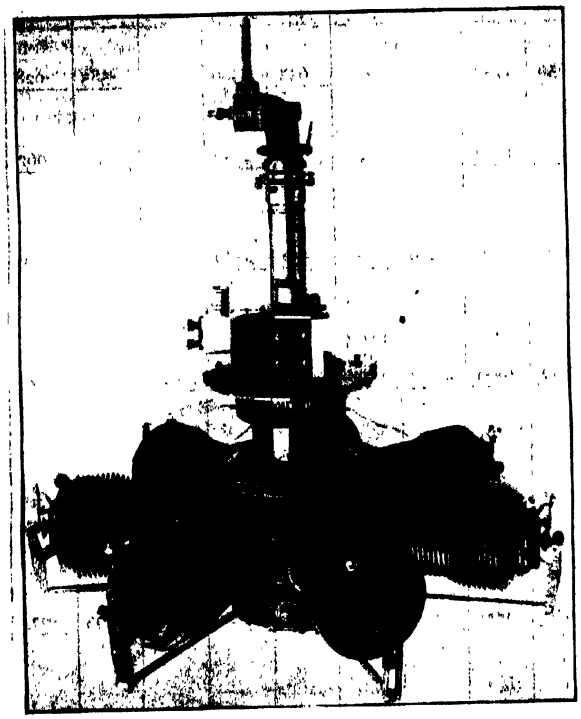

FIG. 15.

The peremptory demands of the war compelled the rapid development of aircraft of all kinds, and aeroplanes driven by two, three, four and even more engines soon became necessary. In 1914 the British depended mainly on the French for aero engines, principally of the "Gnome" and "Renault" types, but towards the close of the war British aero engines in both quality and number surpassed all others. At the end of 1918 the aggregate H.P. of the British aero engines was 7,094,000, and of this huge total 4,143,000 was contributed during 1918 alone.

Progress in the commercial applications of aircraft is slow, but will certainly continue, and increase; its vital importance in warfare renders it essential that adequate encouragement be afforded to enable it to be developed in all directions.

*Group 5. Special Types.* (*a*) *The Humphrey Pump.*—This is an internal combustion pump, simple in principle, and of high efficiency. Its mode of working will be understood by fig. 17.

It consists essentially of a U-tube AA'A" containing water, one leg of which, A, is closed; within this closed end a mixture of gas and air is introduced, compressed, and exploded, thus setting the water column in oscillation; the water thus rises in A", and some is discharged through B into the upper reservoir as indicated. C is a lightly spring-supported inlet valve which opens automatically, admitting a charge of fresh mixture, when the water-column in descending reduces the pressure in A to below that of the atmosphere; on the return oscillation C at once closes, and the fresh charge is compressed in A, and fired by the ignition plug S at the instant of maximum compression; explosion at once occurs, and the water in A is driven rapidly downwards, with corresponding rise in A" and discharge through B. Towards the end of the working stroke the fall of the water in A causes the resultant pressure upon the suction valve E to become vertically *downwards;* E thereupon opens, admitting a fresh supply of water to the U-tube from the lower reservoir, and simultaneously, by a simple link-work, releases a pawl holding up the exhaust valve D which at once falls by its own weight, permitting the burnt gases to discharge into the atmosphere. The exhaust valve D is placed at the lower end of a short pipe projecting downwards into the combustion chamber as shown, and remains open during the return oscillation of the water-column in A until the water-level reaches and closes it, the pawl then automatically locking it in readiness for the next cycle.

The residual burnt gases are next compressed by the still rising water column in A, which is thus brought to rest. On the succeeding downward oscillation the pressure in A rapidly falls below that of the atmosphere, whereupon the automatic inlet valve C opens and admits a fresh charge; the sequence of operations is then repeated.

The pump as described thus works upon the "4-stroke" cycle, but is also, suitably modified, arranged to work on the 2-stroke cycle; a full account of this very ingenious application will be found in Mr. Humphrey's paper in the *Proc. Inst. Mech. Eng.* for Dec. 1909. It will be noted that, excepting the valves, there are no moving parts, the momentum of the water-column being utilized to charge and compress in the working cylinder, and obtain the fresh supplies of water to be pumped. The four strokes of the cycle, as above described, are all unequal, the working stroke being the longest; this is thermodynamically an advantage.

Mr. Humphrey has produced designs of pumps of this type capable of working with a suction, and for lifts of as much as 300 feet.

A very interesting installation of Humphrey pumps is that at the Chingford reservoir of the Met. Water Board, where are five large pumps, each of which delivers 40,000,000 gallons of water daily into the reservoir from the River Lea. Each pump cylinder is 7 ft. in diameter, and develops from 250 to 300 horse-power. The pumps use gas supplied by anthracite-burning gas-producers, and the consumption per actual pump-horse-power-hour is stated to be about 0·9 lb. of anthracite only.

(*b*) *The Internal Combustion Turbine.*—The exceedingly difficult problem of the internal combustion turbine has continued to receive attention; the chief difficulty encountered has been that of the extremely high temperature (1500–2000°C.) of burning gas in relation to the metals employed in construction.

The late M. Réné Armengaud succeeded in obtaining 300 B.H.P. from a petrol internal combustion turbine of constant-pressure type by reducing flame temperature at efflux to about 400°C. by the addition of large quantities of steam; this may accordingly be equally well regarded as a highly superheated steam turbine. About 3 lb. of petrol were required per B.H.P.

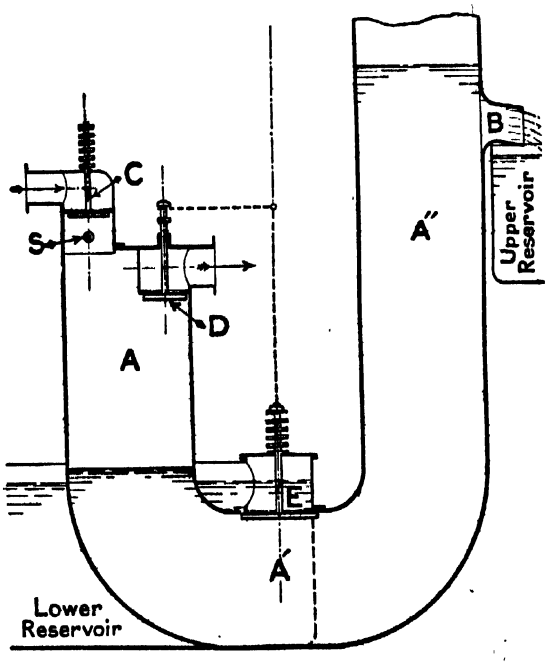

FIG. 17.

hour, which is fully five times as much as is needed by a modern petrol engine of normal type. M. Karovodine has also built a small turbine in which explosions from atmospheric pressure occurring in rapid succession drive a small impulse wheel; this turbine was very small, giving only 1·6 B.H.P. at 10,000 revs. per minute, and the fuel consumption was very high. It is con-

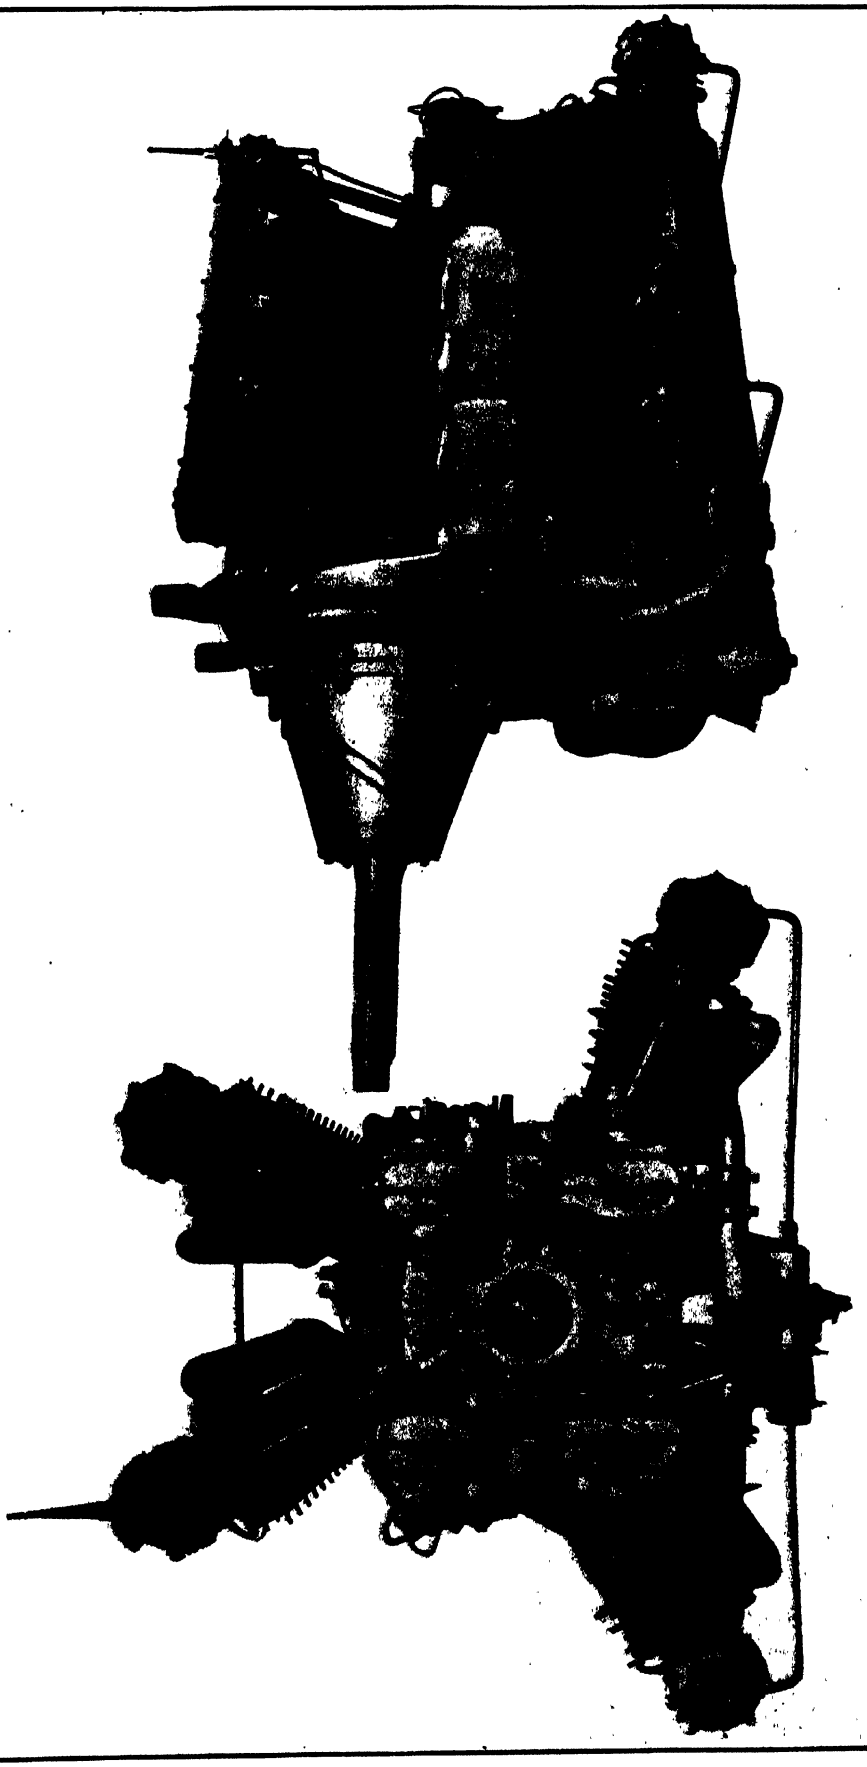

FIG. 16.—END AND SIDE VIEW OF 16-CYLINDERED 1000-H.P. AERO ENGINE.

sidered by many engineers that a combination of the steam and gas turbine will be found to be a satisfactory solution.

Herr Holzwarth has, however, devoted many years to the production of the gas turbine alone, and has made noteworthy progress.[1] The Holzwarth turbine unit comprises a small combustion chamber supplied with a mixture of gas or oil vapour and air by a suitable pump, through mechanically operated inlet valves.

The mixture is delivered under small pressure and ignited by a H.T. magneto. The resulting gases, at high temperature and pressure, then discharge through a spring-controlled flap valve termed the "nozzle valve," and issuing from the nozzle impinge on the vanes of the rotor. Having passed the vanes, the gases enter an exhaust chamber wherein a partial vacuum is maintained by a suitable exhauster. Shortly after ignition the nozzle valve is slowly closed mechanically, sufficient time being allowed for a gust of scavenging air to be passed through the combustion chamber, which is thus cooled and cleared in readiness for the next working charge; this air-gust also cools the nozzle and rotor vanes.

Thus the action is intermittent, and three valves and charging and exhausting pumps are required. In an actual turbine several such units are disposed around a turbine wheel, or "rotor."

Towards the end of 1920 the first gas turbine, using oil fuel, was built in Germany to a definite order by Herr Holzwarth. This turbine is direct-coupled to an alternator, and is stated to develop 500 B.H.P. with an overall thermal efficiency of 26%.

(*c*) *The "Still" Engine.*—This is a combination of an internal combustion engine and a steam engine. The working cylinder at one end uses a combustible mixture of gas or oil vapour and air, and at the other end of steam produced from the exhaust of the "internal combustion" end of the engine. The quantity of steam generated from the heat of the exhaust is stated to be about 7 lb. per B.H.P. hour at full load.

An experimental "Still" engine tested by Prof. Vernon Boys gave an average mean effective pressure on the 4-stroke internal combustion side of 90 lb. per sq. inch, and from the steam side of 14 lb. per sq. inch; thus the effect was equivalent to that of a normal 4-stroke internal combustion engine giving a mean effective pressure of $90-(2\times14)=118$ lb. per sq. inch, as the "steam" end has a 2-stroke cycle.

A high thermal efficiency is claimed, and it was stated in May 1921[2] that official trials recently carried out on a 350 B.H.P. experimental "Still" engine under Lloyd's inspection had shown such favourable results that Messrs. Scott's Shipbuilding & Engineering Co., the licensees, had decided to standardize designs of 6-cylinder marine sets of 2,000 B.H.P. using oil fuel in the manner of a 2-stroke cycle Diesel engine, with "solid," *i.e.* mechanically sprayed, injection of fuel into the cylinders. These engines would be started and reversed by steam. The development of this combination of internal combustion engine and steam engine was one which in 1921 was being followed by engineers with much interest. (G. A. Bu.)

**INTERNATIONAL LABOUR ORGANIZATION.**—An important part of the scheme for a League of Nations embodied in the Peace Treaty of Versailles in 1919 involved the creation of a new International Labour Organization. The Labour part of the Treaty (Part XIII.) rested on the principle laid down in its preamble that there can be no social peace which is not based on social justice. It represented the aspiration which moved all classes to carry over into peace the community of sentiment and of action which had held them together during the dark hours of the World War.

Aiming therefore at the promotion of social peace, the International Labour Organization was founded on two main beliefs—the belief that there must be international coöperation in the industrial sphere, if suicidal competition, leading to much human misery, and perhaps to fresh wars, was to be avoided, and the belief that such coöperation must be based on the collaboration between the State, Capital and Labour. The organization was therefore to consist of all the states forming the League of Nations, who were to meet annually in conference and draw up international agreements for regulating and improving industrial conditions. By raising the standard of living and the lot of the worker everywhere, the worst evils of commercial rivalry, and the penalty which it had hitherto imposed on progressive social legislation, could be gradually removed. This could only be done by international agreements having the force of treaties. Under the provisions of Article 405 of the Treaty these agreements are cast in the form of "draft conventions" and "recommendations," which each State is bound to lay before its legislative or other authorities within a maximum period of eighteen months. Special provision is made to meet the case of federal constitutions, such as those of Canada, Australia and the United States, where labour legislation is not within the competence of the federal authority, but is a matter for the individual states or provinces. There were some who took part in the Paris negotiations and who wished to go further. They advocated that the Conference should be vested with the powers of a super-parliament, whose decisions should be immediately binding; but finally the more modest proposal of the British delegation, who put forward the scheme, was adopted, and it was left to the sovereign power in each state to accept or reject the proposals adopted by the conference. The constitution as defined by the Treaty provides therefore that the final decision rests with the government or parliament of each country. Once its approval is given to a draft convention, the formal ratification is conveyed to the secretary-general of the League, and the enforcement of its provisions becomes a treaty obligation.

This procedure is, apart from the imposition of a time-limit, not essentially different from the usual procedure followed by diplomatic conferences before the war, but when the composition of the International Labour Conference is considered, several marked departures from precedent will be observed. In the past governments alone took part in international discussions which were to result in creating international obligations. This meant that the delegates were tied down to carrying out their official instructions, and that mutual concession must be carried to the point where virtual unanimity was reached, if any practical consequences were to follow. The constitution of the International Labour Conference broke away from the diplomatic tradition. It provided for four delegates from each country, two only representing the government, the other two being chosen in agreement with the most representative organizations of employers and of workers in each country. The reason for this innovation is not far to seek. In discussing labour problems it is impossible to ignore the great employers' associations and trade unions, which are primarily interested and which are the controlling factors in modern industry. Once unofficial delegates were admitted, it followed as a necessary corollary that each national delegation could not be expected to act as a whole, but that its members must be free to speak and vote as they pleased. Hence it was no longer possible to look for unanimity, and it was accordingly provided that a draft convention or recommendation must be carried by a two-thirds majority, but that once so carried, its consideration (though not its adoption) became obligatory on the governments, whether their representatives had voted for it or not. By this means international public opinion could exert its influence even in countries which might be unwilling to accept the standards of the majority.

One further point requires brief notice. During the original discussions in Paris there was considerable division of opinion on the question whether the governments should have one vote or two. It was argued from the Labour point of view that the double vote would place the workers in a hopeless minority, and reduce them to impotence against the three votes exercised by the governments and the employers. On the other side, it was pointed out that not only was it probable that the official delegates would be as often on the side of the workers as on that of the employers, but that on the equal voting system the latter would with the assistance of a single government be able to block any proposal. Moreover, unless the majority of the governments accepted a draft convention, there was small likelihood of its being ratified, and this in itself justified their larger voting power. The subsequent experience of the Washington and Genoa conferences may be held to have justified these contentions.

[1] v. "The Gas Turbine," Holzwarth & Chalkley (Griffin 1913).
[2] v. *The Times* "Engineering Supplement," May 1921.

Supposing then that a convention has been duly ratified by a number of states, what guarantee is there that it will be enforced? Clearly unequal enforcement would largely destroy its value, and would penalise the countries which had acted up to their obligations. To meet this contingency the Treaty provided that where a state failed to carry out its obligations after having its attention drawn to the matter, the governing body of the International Labour Office might, if it saw fit, appoint a commission of inquiry. If the commission's report was unfavourable and the state in question still refused to remove the cause of complaint, the matter could be referred to the Permanent Court of International Justice, who would issue a final judgment and might suggest the adoption of the appropriate economic penalties against the defaulting country. In practice it may be held highly improbable that it would ever be necessary to go to such lengths, but this attempt to provide an effective sanction for international engagements is not without interest.

*Washington Conference, 1919.*—The first International Labour Conference was held in Washington in Oct. 1919 as fixed by the Treaty. The fact of President Wilson's illness and of the failure of the United States to ratify the Treaty clouded the atmosphere. Moreover, the prevailing industrial strife in America did not make a favourable setting for the first attempt at coöperation between Capital, Labour and the governments on an international scale. Nevertheless, 123 delegates, drawn from 39 countries, assembled: 73 representing governments, 25 the employers and 25 the workers. They were accompanied by about 150 advisers, a good proportion of whom were women. The conference sat for a month and, once it had found its feet, worked with astonishing purpose and enthusiasm. It dispersed with the feeling that its work had not been in vain. Six draft conventions and six recommendations had been adopted by the necessary two-thirds majority, most of them almost unanimously. It must suffice here to enumerate them, calling attention to one or two points of special interest. The first draft convention provided for the 8-hour day and the 48-hour week in industrial undertakings, with a number of modifications and exceptions which are indispensable to meet the special needs of particular industries or particular countries. Particularly notable were the articles dealing with Japan and India, which, though not bringing them up to the western standard at one bound, contain very considerable reductions in the hours of labour hitherto permitted in those countries. Further draft conventions provided for the establishment of employment exchanges and other measures for combating unemployment, for the prohibition of the industrial employment of children under 14, for the assistance of women in industry before and after childbirth, and for the prohibition of the employment of women and young persons at night. In addition, recommendations were adopted dealing with the treatment of emigrants, the establishment of medical inspection of factories, the prevention of anthrax and lead poisoning, etc.

These results of a month's work on the part of such a heterogeneous and polyglot assembly meeting for the first time were certainly noteworthy. They were not reached without a great deal of keen discussion. Employers and workers stated their views with freedom and force, but at the same time with restraint, and not infrequently it was the rôle of the government delegates to construct a bridge between them. But for all the differences of standpoint, mentality, language and interest, which made the conference such a fascinating microcosm, there was a spirit of good-will and a general common-sense, which enabled it to arrive at solid and workmanlike agreements. The foundation was laid for a real system of international labour legislation immeasurably in advance of anything which had been contemplated before the war. The pioneer work of the International Association for Labour Legislation, which succeeded in bringing together an official conference at Berne in 1906, resulting in a convention for the prohibition of the use of white phosphorus in matches, found its consummation at Washington in 1919, when the beginnings were made of a comprehensive international labour code.

The Washington conference completed its work by laying the foundations of the International Labour Office, the other branch of the permanent organization. The conference elected the governing body, which under the Treaty is charged with the control of the office, and which consists of 24 members. Of these 12 are appointed by governments, eight by those of the eight states of chief industrial importance, the remaining four being selected by the government delegates of the conference. There was some contention as to which were the eight chief industrial states, but finally, under protest from India, the following list was accepted:—the United States, Great Britain, France, Italy, Germany,[1] Japan, Belgium and Switzerland. As the first named had not ratified the Treaty, and was therefore not a member of the organization, a fifth place was provisionally thrown open for election, and the following countries were chosen to complete the number:—Spain, Argentina, Canada, Poland and Denmark. In addition to the government members, six employers' and six workers' representatives were chosen by the employers' and workers' groups, which guided their selection by the industrial importance of the organizations which they contained rather than by considerations of nationality. The result was somewhat ill-balanced, as 20 out of the 24 members were from Europe though the equilibrium would have been better preserved had America been able to fill the three places allotted to her. The conference felt the position to be unsatisfactory and passed a resolution in this sense, which led to the reconsideration of the constitution of the governing body.

When elected, the governing body proceeded to appoint the first director of the International Labour Office in the person of M. Albert Thomas, the French Socialist leader, who had created the French Ministry of Munitions during the war, a man of great energy, capacity and enthusiasm. He quickly set to work, and the office took up its quarters in London in Jan. 1920. Its functions as defined by the Treaty fall into two broad divisions. On the one hand, it carries out all the preparatory and complementary work connected with the conference. It prepares the agenda, presents a report on each item containing all the information available on the subject, it performs the secretarial duties, and conducts all the correspondence arising in connexion with the ratification, interpretation and enforcement of the conventions and recommendations adopted. It also undertakes any inquiries which the conference may order. These may be termed the diplomatic functions of the office, which are performed by one of its main branches known as the "diplomatic division." The other main branch is the "scientific division," which, as its name implies, is engaged in the work of investigation and research. The Treaty imposes upon the office "the collection and distribution of information on all subjects relating to the international adjustment of conditions of industrial life and labour," together with the publication in French and English of "a periodical paper dealing with problems of industry and employment of international interest." It is easy to see how huge a field the office is thus expected to cover. There are few, if any, industrial problems which have not their international bearing. If the war and the economic chaos resulting from it had brought home one truth to the world, it was that economically all the nations are to a greater or lesser degree interdependent. And when the importance of labour as an element in production, whether industrial or agricultural, is considered, it may readily be seen that almost all labour problems have their international aspect. It is unnecessary to insist upon a point which is demonstrated on the one side by the tendency of capital to create amalgamations and working agreements, which take no account of national frontiers, and on the other by the movement of the trade unions in almost every important industry, including agriculture, towards the formation of international federations for the protection of their interests. Neither international strikes nor international collective agreements are outside the realm of practical politics.

*Genoa Conference, 1920.*—The first big task of the International Labour Office was the preparation of the second annual conference, which was held at Genoa in June 1920. It was exclusively concerned with the conditions of employment at sea. Of all industries the shipping industry is the most essentially international, and of all callings the seaman's has perhaps received the least attention from the social legislator. The Genoa conference was more specialist in character than its predecessor, and its results necessarily less impressive, because they were less universal in their scope. Nevertheless, they are likely to produce considerable practical improvements in the sailor's lot. The conference adopted three draft conventions. The first suppresses the "crimp," who made his living by fleecing the seaman under the pretext of finding him employment. The convention requires the abolition of all private employment agencies carried on for purposes of gain, or where they are allowed to continue temporarily, their supervision by the government. Moreover, each government undertakes to establish free public employment agencies conducted either by the State or by the joint effort of shipowners and seamen. The second convention provides for the payment to seamen of compensation for unemployment in the event of the loss of their vessel. Finally, a third convention prohibits the employment of boys under 14 on board ship. In addition to these conventions, recommendations were adopted in favour of unemployment insurance for seamen, and in favour of the establishment of national maritime codes. This last measure was regarded as the prelude to the drafting of an international code, which would enable sailors of all countries to serve under uniform conditions, under whatever flag they sailed. The International Labour Office was in 1921 engaged in collecting the material on which the joint maritime commission appointed by the conference might begin the work of framing such a code for submission to a future conference. Finally, two further recommendations were passed dealing with the hours of work on fishing vessels and in inland navigation, but on the difficult question of hours of work in seagoing ships, the conference failed to reach agreement. There were long and vigorous debates on this subject, the main point at issue being whether the French system of a 48-hour week with unlimited overtime compensated either by extra wages or by time off in port,

[1] Germany and Austria were admitted to the organization at one of the following sittings by 71 votes to 1.

or the British Government's proposal of a 56-hour week on deck and 48 in the engine-room, should be adopted. The former failed to obtain the necessary two-thirds majority by a fraction, but as several of the most important seafaring countries were in the minority, including Great Britain, Japan, Norway and Spain, the convention would probably not have been generally applied, had it been actually passed. The sequel, however, showed that legislation is not the only method by which the International Labour Organization can assist in promoting industrial peace.

Shortly after the dispersal of the conference the International Seamen's Federation held a congress at which the results were discussed. A good deal of dissatisfaction was expressed at the failure to obtain any reduction of hours, and a resolution in favour of an international seamen's strike was moved. The loss, suffering and dislocation which such a strike would have caused, however short its duration, require no emphasis. An amendment was eventually carried, however, inviting the director of the International Labour Office to intervene with a view to securing a conference with the International Shipowners' Association, at which the matter could be reopened on a purely industrial basis. The shipowners agreed to the meeting which took place at Brussels in Jan. 1921 under the presidency of M. Albert Thomas. Two joint committees were appointed to examine in detail the revision of hours of work in the engine-room and on deck respectively. An excellent spirit was shown on both sides, with the result that it is proposed to make practical experiments on selected ships to test the new system of hours proposed, which may well pave the way to the first international collective agreement. Such an agreement would undoubtedly mark an important landmark in industrial history.

*International Labour Office.*—As regards the development of the International Labour Office itself, its early months were largely occupied in recruiting and training the staff necessary to carry out its numerous duties. They were gradually drawn together from different countries, and in spite of the variety of language and tradition had at the end of six months attained a degree of unity and cohesion, which enabled the work of the office to reach a very reasonable standard of efficiency and its publication to commence. To the diplomatic and scientific divisions a number of small technical sections were attached, manned by specialists in the problems they were appointed to handle. These sections dealt with unemployment and emigration, agricultural questions, seamen's questions, industrial health, social insurance, including the rehabilitation of men disabled in industry or in war, and coöperation. A further special section was formed to study the social aspects of the Russian revolution in consequence of a decision of the governing body to send a mixed commission of inquiry to ascertain the industrial conditions under the Soviet régime. Owing to the refusal of the Bolshevik Government to admit them, the commission never carried out their mission, but the Russian section which had been formed to prepare the way for their inquiry succeeded in collecting a great deal of first-hand evidence, which had not been previously got together. The section made a scientific analysis of the data thus obtained, and produced the first attempt to give an objective account of the Bolshevik industrial system under the title of "Labour Conditions in Soviet Russia."

Finally a small section was formed to carry out the inquiry into production, which was decided upon by the governing body on the motion of the employers' representatives. The object of this inquiry was to ascertain, if possible, how far the diminution of production was due to the shortening of hours of work, the physical and moral exhaustion produced by the war, or to other causes affecting the output of the individual worker, or how far it was due to deeper economic causes produced by the generally chaotic conditions in which the war had left the machinery for the production and exchange of goods all over the world. To attempt to obtain a clear view of a subject of such complexity was in itself a vast undertaking, but in response to the questionnaire which was sent out in twelve languages to the governments, employers' organizations and the trade unions, a great deal of valuable information about the conditions affecting production in all countries had already been obtained in 1921.

After six months' work in London, the Office was transferred to Switzerland. The Treaty required it to be established at the seat of the League of Nations, and though the secretariat of the League was still in London, the governing body decided for reasons of convenience to transfer the office somewhat earlier to Geneva, which was designated as the future home of the League. Consequently in July 1920, immediately after the close of the Genoa conference, the International Labour Office settled down in its new quarters. After three months' breathing space, it was called upon to take its part in the work of the first assembly of the League. The constitutional relationship between the Labour Organization and the League was generally defined in the Treaty, though some points were not free from ambiguity. The International Labour Office is "part of the organization of the League" and is "entitled to the assistance of the secretary-general in any matter in which it can be given"; but it is not subject to the control of the council of the League, nor is the Labour Organization as a whole in any way dependent upon or subordinated to the assembly, except in the important matter of finance. Unlike the other technical organizations of the League, such as the health or transit organizations, the Labour Organization does not submit its decisions to the council for approval and its agenda are settled not by the council but by its own governing body. Save in the matter of finance, it is an autonomous body attached to the League by ties of common interest rather than by constitutional bonds; in fact, it is a sort of self-governing dominion. The financial link is, however, naturally one of great importance, since money questions are not less vital in international than in national affairs. Hence when the budget of the League was considered by the assembly, the finances of the Labour Organization, which form part of it, also came under review.

As the taxpayer is acutely interested in all public expenditure, it may be interesting to give a rough idea of the cost of the International Labour Office. Its estimates, which were voted by the Assembly for 1921, amounted to 7 million gold francs, which may be taken as approximately equivalent to £350,000. This total is contributed by the 48 States Members of the League, Great Britain as a first-class State paying about £16,000. If these figures are compared with the cost of an average civil department in England, it will be seen that they are exceedingly modest, and it has to be remembered that they include a great many items which do not enter into the estimates of government departments, such as rent, repairs, postage, telegrams, stationery, printing, etc. Again, the conduct of correspondence and publication on a considerable scale in two or more languages more than doubles the effort of the staff, and consequently the cost, which would be entailed if only one language were employed. In order to insure that the utmost economy was being practised, however, and to advise as to the conditions of service, the assembly resolved that a committee of experts should be appointed to inquire into the organization of the secretariat and of the International Labour Office.

At the beginning of 1921 the Office consisted of 95 men and 115 women drawn from 17 different countries. It could deal with every language, except Chinese, in which books bearing upon industrial questions are published. Its library consisted of about 30,000 volumes, mostly purchased from the International Association for Labour Legislation, who had formed at Basle an unique collection of literature on labour and economic questions. The demands made on the office for information by governments and employers' and workers' organizations were growing steadily, and were requiring a constantly widening range of knowledge. A general idea of its work on the scientific side may best be gained by enumerating its publications. Every day it issues a small pamphlet entitled *Daily Intelligence*, which gives information about important events connected with labour and industry, which are not usually available to the reader of the daily press. Every week it issues an *Official Bulletin*, which reports the sittings of the governing body, records the progress of the ratification of the conventions and of the legislation for giving effect to them, and reproduces any important official correspondence. It is, in fact, the official organ of the International Labour Organization. Every month the office publishes the *International Labour Review*, which consists partly of studies prepared in the office dealing with the various subjects which concern it, partly of articles contributed by well-known economists or by leaders of thought in the industrial and trade-union worlds. Apart from these regular publications, all of which appear both in English and French, the office also issues a legislative series containing reprints or translations in English, French and German, of the principal labour laws passed by the parliaments of the world, as well as a number of special studies and reports on questions of current importance, such as the occupation of the factories by the workers in Italy, the history of the miners' strike in Great Britain, the conditions of labour under the short-lived Soviet régime in Hungary and similar topics, which have an interest to the social student everywhere, but about which he finds it difficult to get trustworthy information. In all its publications the aim of the office is to treat the subject-matter with scientific accuracy and complete objectivity, so that they may come to be regarded as really valuable and impartial contributions to social

science. In the controversial atmosphere which surrounds so many economic problems to-day, this is not an ideal easily achieved; but if it can be realized, the presentation of the facts upon which future policies must be founded from an international and unprejudiced standpoint will be of real service to honest seekers after truth.

*Internationalism.*—There is one other task which lies upon the International Labour Organization and which goes to the root of its existence—the creation of an international spirit. Unless that spirit can be born and fostered, neither the League of Nations nor any institution connected with it can hope to survive. It is not a question of paying lip-service to catch-words, of realizing "the brotherhood of man," of reviving in the 20th century the picturesque but shadowy idealism of Rousseau. To create a true international spirit it is necessary to begin practically and prosaically at the bottom instead of presumptuously and poetically at the top. The first and most elementary lesson consists of the inculcation of the fact that there are more links, economic, social and human, which bind nations together than there are divergent interests and antagonistic aims which pull them asunder. It is not an easy lesson to learn. The nationalistic impulse in a people is almost as deep-rooted and instinctive as the egoistic impulse in the individual. But just as men cannot live without working with and for their fellow-men in society, so nations cannot exist without coöperating with other nations. Because, however, the nation, being the larger unit, is more nearly self-sufficient than the individual, national public opinion is slow to realize its dependence on others and is apt to believe its national self-sufficiency far more complete than in the modern world it can possibly be. Internationalism is not the antithesis of nationalism, but its complement. Properly understood, it does not mean the emasculation of the national spirit, which represents the embodiment of the ideals, the traditions and the virtues built up during many generations of common national effort. On the contrary, it means the pooling of the spiritual resources of all nations in order to make their intercourse more fruitful and to bring the society of which they are all members to a higher level of prosperity and civilization. To achieve such a result public opinion needs to possess an international as well as a national consciousness. It must acquire a world point-of-view, a *Weltanschauung*, as a corrective and an enlargement of its national standpoint. Instead of regarding the foreigner with instinctive mistrust, if not with sub-conscious aversion, it will then realize that in most respects he is remarkably similar, that he is grappling with similar problems, faced by similar needs, the victim of similar economic disabilities, which everyone can meet more successfully by working together to find the right solution than by working alone without each other's experience.

Perhaps the principal work of the International Labour Organization is to bring about such collaboration in the industrial field, and so to contribute towards the formation of a practical international spirit. In the present state of economic interdependence which the world has reached, to hunt in isolation for the solution of economic problems, which are in a large measure common to all countries, is hunting deliberately in the dark. When the delegates of the 48 states comprising the League meet at the annual conferences, they not only discover an unsuspected community of ideas and sentiments, but also an astonishing identity in the difficulties which preoccupy them. The labour question, which is largely a psychological question, is essentially the same in Japan as in Great Britain, despite all the variations of mentality, historical evolution and national tradition which go to make up its setting. The mere meeting of the International Labour Conferences does much to promote a sense of common interest and an understanding of the value of coöperation. For its everyday work the International Labour Office attempts to reach the same end by making known to every country what is being thought and done in others through the medium of its publications and of its correspondents. In London, Paris, Washington, Rome and Berlin, regular correspondents are established. Their business is partly to collect first-hand and complete information about the industrial developments in their own country and to keep the office in touch with its government and its great organizations of employers and workers. But an even more important part of their duties is to make known the work of the organization and so to educate public opinion to see things through international eyes. The value, indeed the indispensability, of such a system of contact for an international organization is shown by the frequent demands which have been received for its extension to other countries. Such a network of international connexions can only be gradually and carefully built up, but it is the surest method of fostering the sense of international community, which is essential to the life of the League of Nations and its allied institutions. Like all other institutions, they are liable to feel the effects of the actions and reactions which affect the current of human progress. The vaulting idealism which marked the close of the World War has given ground before a wave of more materialistic sentiment bred of discouragement and disillusionment, because the new world is as yet apparently no better and certainly less prosperous than the old world we remember before the war. But the ideas embodied in the labour part of the Peace Treaty have already obtained a sufficient hold to justify the belief that their survival and development are as certain as those of any movement can be in an age when all things are in flux and nothing can claim finality. (H. B. B.)

**INTERNATIONAL LAW** (*see* 14.694*).—The World War led a certain number of "practical" people to the length of declaring international law to be extinct; and, no doubt, in practice during the war the breaches of its principles were more familiar than the cases of its observance. Yet the belligerents never ceased to appeal to it against one another, and to make propagandist capital out of violation of its teachings. In spite, therefore, of there being ground for discouragement, international law has never ceased to be the usage which had grown up as the legitimate practice of civilized mankind, and the violations and deviations only leave it on a more solid foundation of principle than ever. The offences committed by different belligerents against it, moreover, have served to intensify the feeling that safety in the future from international intrigue and hatreds, fomented by leaders of great material interests among ignorant or degenerate masses, lies rather in the diffusion of the spirit of law, its codification, and the creation of agencies for its enforcement against those who disregard it.

1. *General.*—The framers of the treaties of peace evidently felt that public opinion throughout the world demanded something higher than the rule of force, and the preamble sets out among the four purposes of the Covenant of the League of Nations "the firm establishment of the understandings of international law as the actual rule of conduct among governments." The whole preamble reads as follows:—

"In order to promote international coöperation and to achieve international peace and security, by the acceptance of obligations not to resort to war, by the prescription of open, just and honourable relations between nations, by the firm establishment of the understandings of international law as the actual rule of conduct among governments, and by the maintenance of justice and scrupulous respect for all treaty obligations in the dealings of organized peoples with one another."

In further recognition of the demand of the world for law in the place of force, Article XIV. of the Covenant sets out that the Council of the League of Nations "shall formulate and submit to the members of the League for adoption plans for the establishment of a Permanent Court of International Justice," and that "the Court shall be competent to hear and determine any dispute of an international character which the parties thereto submit to it"; and it goes still further in providing for its obtaining a sort of moral influence over the League itself in that "it may also give an advisory opinion upon any dispute or question referred to it by the Council or by the Assembly."

The framers of the Covenant unfortunately had inserted Article X., which resulted in the United States refusing to join the League.

Yet the article at first sight seemed harmless. It provides that "the members of the League undertake to respect and preserve as against external aggression the territorial integrity and existing political independence of all members of the League," and that "in case of any such aggression or in case of any threat or danger of such aggression the Council shall advise upon the means by which this obligation shall be fulfilled." Closer examination showed that it lent itself to interpretations inconsistent with the objects of a League of Peace. To the undertaking to respect the territorial integrity and existing political independence of the members of the League there could be no objection, but the "obligation" "to preserve them against external aggression" or a "*threat of aggression*" practically constituted the League an agent for defence of the

**These figures indicate the volume and page number of the previous article.*

provisions of the Treaty generally, and warranted a potentially offensive attitude on mere suspicion of aggressive purposes—a possible "arming to prevent war." It might bring us back to the old pre-war conditions, based on the profiteering maxim: *Si vis pacem para bellum.*

The notion that usage without sanctions is not law underlay the introduction of Article X. into the Treaty—a notion which is not borne out by either the history of civil law or its practice.

It is seen, in short, that international law is by no means dead. Far from being dead, it is relied upon more than ever to become a substitute for force, and especially for the pre-war theory of the necessity of competition in armaments.

The successful creation of numerous new societies for the study and promotion of the reign of law among nations shows how widespread is the feeling that we need more respect for law and less for solutions dictated at the cannon's mouth.

Moreover, there remain the Wilsonian principles, as accepted by all the belligerent Governments, constituting a sort of new charter for guidance in the reform of public law which in creating the League of Nations and its adjuncts have laid the foundations of new organs for the strengthening and enforcement of law among and between Governments.

A close examination of the 14 points laid down by President Wilson in his address of Jan. 8 1918, reaffirmed in the four of that of July 4 1918, and the five of his address of Sept. 27 1918, reveals several underlying principles which may be considered as constituting a sort of fundamental international programme adopted with one reservation by the Allies in Mr. Lansing's reply to Germany of Nov. 5 1918, and freely accepted by Germany and her allies. These principles may be summed up as follows:—

1. No secret international agreements (1;—also one of the five);
2. Freedom of the sea and its channels (2, 12;—subject to reservations referred to in Mr. Lansing's letter of Nov. 5);
3. Most favoured nation treatment to be generalized (3;—also one of the five);
4. Restriction of armaments (4);
5. Acquiescence of populations in all matters affecting sovereignty over them (5, 6;—also one of the four);
6. Abolition of the "right of conquest" (7, 8, 11;—also among both the four and the five);
7. Access to the sea a right for all States (11, 13);
8. All States as settled by the Treaty of Peace to be guaranteed an equal right to their independence and integrity (14;—also among the four);
9. Racial homogeneity of population to be a ground of adjustment of frontiers (9, 12).

Principle (5) may in some instances conflict with principle (9); (3) may not always tally with (8), and some of them may not be capable of universal application. Nevertheless, they constitute the main lines on which it was promised to European democracy that a resettlement of Europe would be based. (See Barclay, *Collapse and Reconstruction.* Boston, 1919, p. 21, etc.)

A crude, and not always successful, attempt was made in the treaties of peace to carry out these principles. Democracy in the chief countries of the Allied Powers, unfortunately, had not yet had time up to 1921 to grasp their importance. Moreover, their application, to a great extent, has been obscured and perverted by circumstances which arose out of the chaos caused by conflicting claims of ambitious and noisy minorities, and the recasting by an unskilled diplomacy of Western Europe. Nevertheless, the charter exists, and with the spread of democratic influence among Governments its importance for posterity will probably become more distinctly obvious.

The subjects on which the war and its after-effects may be said to have led to differences of view, and which are likely more particularly to be influenced in the development of international law, are neutrality, contraband of war, blockade and prize, the position of armed merchant vessels, the rights and duties of aircraft, and the legal conditions applicable to enemy private property.

2. *Neutrality.*—The old theory of neutrality was that the only restrictions to which a neutral's freedom of action in war was subject were such as would or might constitute assistance or favour, direct or indirect, to either belligerent. Thus neutral ships had to submit to visit and search for contraband of war, and to respect blockade of enemy ports and areas. But they had, in general, the right to carry on intercourse and traffic with either enemy without hindrance, even to supply either side with munitions of war subject only to the belligerent right to capture them if possible.

At the outset of the war, and during the first years of its continuance, there was considerable diplomatic friction between the United States and England, and between the United States and Germany and Austria, respecting the British restraints on American commerce on the one hand, and, on the other, on account of the overwhelming advantage enjoyed by England in respect of war material supplied from the United States.

One of the chief subjects of American complaint was the new practice instituted of bringing neutral vessels into port for search instead of the older practice of visit and search, which interfered as little as possible with the course of their voyage.

The American Secretary of State in a communication of Oct. 21 1915 to the United States ambassador in London protested against the British contention that "modern conditions" justify bringing vessels into port for search, and that the size and seaworthiness of modern carriers of commerce and the difficulty of ascertaining the real transaction in the intricate trade operations of the present day make it impossible to effect an adequate search on the high sea. "It is believed," he wrote, "that commercial transactions of the present time, hampered as they are by censorship of telegraph and postal communication on the part of belligerents, are essentially no more complex and disguised than in the wars of recent years, during which the practice of obtaining evidence in port to determine whether a vessel should be held for prize proceedings was not adopted." The effect of the size and seaworthiness of merchant vessels upon their search at sea, he added, had been submitted to a board of naval experts, who had reported that:—

"At no period in history has it been considered necessary to remove every package of a ship's cargo to establish the character and nature of her trade or the service on which she is bound, nor is such removal necessary. . . . The facilities for boarding and inspection of modern ships are in fact greater than in former times, and no difference, so far as the necessities of the case are concerned, can be seen between the search of a ship of 1,000 tons and one of 20,000 tons—except possibly a difference in time—for the purpose of establishing fully the character of her cargo and the nature of her service and destination. . . ."

Complaints were also made respecting the detention of neutral vessels on bare suspicion and the methods employed in respect of evidence against them. The U.S. Government pointed out that under the hitherto existing practice when a vessel was brought in for adjudication, courts of prize considered "at the first hearing only the ship's papers and documents, and the goods found on board, together with the written replies of the officers and seamen to standing interrogatories taken under oath, alone and separately, as soon as possible, and without communication with or instruction by counsel, in order to avoid possibility of corruption and fraud." Additional evidence was not allowed to be introduced except upon an order of the court for "further proof," and then only after the cause had been fully heard upon the facts already in evidence or when this evidence furnished a ground for prosecuting the enquiry further. This had been the practice of the U.S. courts during the war of 1812, the American Civil War, and the Spanish-American War, and had been the practice of the British prize courts for over a century. This practice was changed by the British prize court rules adopted by the Order in Council of Aug. 5 1915. Under these new rules there was no longer a "first hearing" on the evidence derived from the ship, and the prize court was no longer precluded from receiving extrinsic evidence for which a suggestion had not been laid in the preparatory evidence. The result was, contended the U.S. Government, that innocent vessels or cargoes were seized and detained on mere suspicion, while efforts were being made to obtain evidence from extraneous sources to justify the detention and

the commencement of prize proceedings, and "the effect of this new procedure was to subject traders to risk of loss, delay, and expense so great as practically to destroy much of the export trade of the United States to neutral countries of Europe."

The interest of neutrals is necessarily different from that of belligerents, and their standpoints are influenced accordingly. It is possible that there will be other wars long before there is again one in which the belligerents will form the bulk of the world power. The precedents of the World War are, therefore, subject to the qualification that neutral states, with one exception, were not in a position to assert their rights by force, and that the one great neutral Power in question, which had the power to assert neutral right, came to have an interest which was practically identical with that of one of the parties in the struggle till it became entirely so.

We may, therefore, regard the principles and rules of international law respecting neutrality at the end of the World War as in no essential particular different from those which civilized mankind before the war had come to regard as binding.

3. *The Declaration of London.*—This convention (Feb. 26 1909) had not been ratified at the outbreak of the war by any of the Governments concerned. In the Italo-Turkish War, Turkey and Italy as belligerents had given effect to it as a whole, and Russia as neutral in part.[1] Great Britain had gone the length of giving effect to it by passing an Act through the House of Commons which the House of Lords had thrown out. The U.S. Senate (April 24 1912) "advised and consented" to the ratification of the declaration, but the ratification had not been deposited in London.[2]

The U.S. Government early in the war (Aug. 6 1914) made a suggestion that the belligerent Powers should adopt the declaration in its entirety as a code of international law. Its acceptance by the belligerents, the Secretary of State urged, might prevent the grave misunderstandings between belligerents and neutrals to which different views on the maritime law of war would expose their relations. The German and Austro-Hungarian Governments declared their readiness to give effect to the declaration subject to reciprocity. The British Government declared, however, that it could only observe the provisions of the declaration in so far as this did not conflict with the "efficient conduct" of naval operations. The French Government took the same line as that of Great Britain. The Italian Government in due course followed their example. The U.S. Government, meanwhile (Oct. 22 1914), in view of the little response made to its proposal withdrew it. A British Order in Council of Aug. 20 1914, however, had given effect to the declaration subject to modifications and additions. But the modifications grew with the progress of the war, and with the "manifest developments of naval and military science, the invention of new engines of war, the concentration by the Germanic Power of the whole body of their resources on military ends."[3] In view of these conditions, altogether different from those prevailing in previous naval wars, by Order in Council of July 7 1916 the declaration was finally withdrawn.

4. *Contraband of War, Blockade and Prize.*—International law forbids neutrals to do certain things for the benefit of a belligerent. Among these are the supply of articles of direct or indirect help to him in the prosecution of the war. As Grotius says:—

"There are still disputes as to what may lawfully be done to those who are not our enemies, nor are willing to be thought so, and yet furnish our enemies with supplies. This is a point which has been sharply contested, both in ancient and modern times, some maintaining the extreme right of war, others the freedom of commerce. In the first place, we must distinguish between the things themselves, for there are some things which are of use only in war, as arms, others which are no use in war, but serve only for pleasure; others which are useful both in war and peace, provisions, ships, and their appurtenances."

Grotius approves of forbidding neutrals to supply the enemy with articles of the first kind, and of permitting traffic in articles of the second kind. As regards the third kind, those which are of use, both in time of war and in time of peace (*usus ancipitis*), he makes a distinction:—

"For if I cannot protect myself unless I intercept what is sent, necessity will give me a right to intercept it, but under the obligation of restitution, except there be cause to the contrary. But if the supplying of the articles will impede the execution of my design, and he who transports them might have known this fact—as, for instance, if I am besieging a town or blockading a port, and a surrender or a peace is daily expected, he will be liable to me for damages, and his property may be taken to satisfy them. If he has not done the damage, but is only attempting to do it, his property may be detained until he gives security for the future; but if the injustice of my enemy be very clear, and the supplies conveyed to him support him in his unjust war, then shall the party who conveys them to my enemy be not only liable to repair my loss, but he may be treated as a criminal, as one who is rescuing a notorious offender from impending judgment; and for this reason it will be lawful for me to deal with him according to his offence, and for the purpose of punishment I may deprive him of his merchandise" ("*De Jure Belli et Pacis*," lib. iii., c. i., s. 5).

International law at the outbreak of the war still recognized the distinctions laid down by Grotius, the first kind being known as "absolute contraband," and third as "conditional contraband." And, as usual, Governments at the outbreak of war issued lists of absolute and conditional contraband. The Declaration of London (1909), following Grotius' distinctions, adopted a third list of articles, corresponding to his second kind, which are never to be declared contraband. Among them, rather inconsistently, figured "raw cotton," which had been a concession to England. The drafting committee stated, however, that this free list was not exclusive, but merely indicative.

There had been a strong movement on the European continent before the war in favour of abolishing conditional contraband. Moved by the desire to distinguish unmistakably from, so to speak, constructive contraband, and to protect trade against the vexation of uncertainty, many continental jurists had come to argue it away altogether. There were, however, signs of a change of opinion, judging by the discussions on the subject in the Institute of International Law, a body exclusively composed of recognized international jurists. The rules this body adopted in 1896, though they did not represent the unanimous feeling of its members, may be taken as the opinion of a large proportion of them. In any case the majority comprised German, Danish, Italian, Dutch and French specialists. The rules contain a clause which, after declaring conditional contraband abolished, stated that "nevertheless, the belligerent has, at his option and on condition of paying an equitable indemnity, a right of sequestration or preëmption as to articles (objects) which, on their way to a port of the enemy, may serve equally in war or in peace."[4]

Thus, by the established classification goods are divided into three classes:—(1) Goods primarily used for warlike purposes; (2) goods which may be equally used for either warlike or peaceful purposes; (3) goods exclusively used for peaceful purposes.

Under the law of contraband as it stood at the outbreak of war, goods in the first class might be seized if proved to be going to the enemy country; goods in the second class might be seized if proved to be going to the enemy Government or its armed forces; goods in the third class passed free. Attempts of belligerents to enlarge the first class at the expense of the second, and the second at the expense of the third, had only been frustrated at the expense of considerable friction with neutrals.

Under the rules of prize law, as laid down a century ago, goods were not regarded as destined for an enemy country unless they were to be discharged in a port in that country; but the American prize courts in the Civil War found themselves compelled by the then existing conditions of commerce to apply and develop the doctrine of *continuous voyage*, under which goods which could be proved to be ultimately intended for an enemy country were not exempt from seizure on the ground

[1] See Sir Thomas Barclay, *Turco-Italian War and its Problems* (London 1912), p. 99).

[2] See Garner, *International Law and the World War* (London 1920, vol. i., p. 31).

[3] Note by British Government to neutral Governments.

[4] See Barclay, *Law and Usage of War* (London 1914, p. 24 *et seq.*).

that they were first to be discharged in an intervening neutral port. By British Order of Council of Aug. 20 and Oct. 22 1914, and the corresponding French decrees, the lists of contraband and free goods in the Declaration of London were rejected, and the doctrine of "continuous voyage" was applied not only to absolute contraband, but also to conditional contraband, if such goods were consigned to order, or, if the papers did not show the consignee of the goods, or if they showed a consignee on enemy territory. The situation as regards German trade has been officially recorded to have been as follows:—Direct trade outside the Baltic to German ports had practically ceased. Supplies to Germany were directed to neutral ports, and every effort was made to disguise their real destination. The power the Allies had to deal with the then existing situation was that they had the right to seize articles of absolute contraband if it could be proved that they were destined for the enemy country, although they were to be discharged in a neutral port, and to seize articles of conditional contraband if it could be proved that they were destined for the enemy Government or its armed forces, although they were to be discharged in a neutral port. On the other hand, there was no power to seize articles of conditional contraband if they could not be shown to be destined for the enemy Government or its armed forces, or non-contraband articles, even if they were on their way to a port in Germany, and there was no power to stop German exports.

It soon, however, became clear that the restrictions international law placed in the way of inflicting on the enemy to the full the advantage of absolute command of the sea would deprive the Allies of a powerful weapon. This led to the adoption in March 1915 of more extended powers of intercepting German commerce. The Allied Governments decided to stop all goods which could be proved to be going to, or coming from, Germany. This general blockade swept away all distinctions respecting contraband, and the nature of the commodities in question ceased to be of any importance. Once their destination or origin was established, the power to stop them was complete.[1]

The policy adopted in order to enforce the blockade of Germany was as follows:—(1) German exports to overseas countries were almost entirely stopped. Such exceptions as were made were where a refusal to allow the export of the goods would hurt the neutral concerned without inflicting any injury upon Germany. (2) All shipments to neutral countries adjacent to Germany were carefully scrutinized with a view to the detection of a concealed enemy destination. Wherever there was reasonable ground for suspecting such destination, the goods were placed in the Prize Court. Doubtful consignments were detained until satisfactory guarantees were produced. (3) Under agreements in force with bodies of representative merchants in several neutral countries adjacent to Germany, stringent guarantees were exacted from importers, and, so far as possible, all trade between the neutral country and Germany, whether arising overseas or in the neutral country itself, was restricted. (4) By agreements with shipping lines and by a vigorous use of the power to refuse bunker coal, a large proportion of the neutral mercantile marine which carries on trade with Scandinavia and Holland was induced to agree to conditions designed to prevent goods carried in these ships from reaching the enemy. (5) Efforts were made to introduce a system of rationing which would ensure that the neutral countries concerned only imported such quantities of articles as were normally imported for their own consumption.[2]

The result of the blockade was that the export trade of Germany was substantially destroyed. With regard to imports, some of the most important, such as cotton, wool, and rubber, were practically excluded from Germany. Others, like fats and oils and dairy produce, could only be obtained there, if at all, at famine prices, which led to considerable discontent among the population, and food riots in some of the large towns.

This means of bringing an enemy to sue for peace was on a more extended scale only the same in principle as that of the siege of a city and cannot be regarded as a violation of international law. The power of the Allies, as shown by results, to make the blockade effective may be regarded as its justification.

5. *The s.s. "China" Case.*—The s.s. "China" affair was a case of some importance, having led to an examination of the current bearing of the famous "Trent" case, which in its time gave rise to serious friction between Great Britain and the United States. On Feb. 18 1916, the British cruiser "Laurentic" stopped the "China" on the high seas, about 10 m. from the entrance to the Yangtsze-kiang, boarded her with an armed party, and, despite the captain's protest, removed from the vessel 28 Germans, 8 Austrians and 2 Turks, including physicians and merchants, and took them to Hong-Kong, where they were detained as prisoners in the military barracks. The U.S. Government in the note on the subject to the British Government alleged that as none of the men taken from the "China" were incorporated in the armed forces of the enemies of Great Britain, the action of the "Laurentic" must be regarded by it as an unwarranted invasion of America's sovereignty over her vessels on the high seas. The U.S. Government referred to the "Trent" case, and expressed surprise at this exercise of belligerent power on the high seas far removed from the zone of hostile operations. The ambassador was directed to present the matter to the Government of Great Britain at once, and to insist vigorously that if facts were as reported, orders be given for the immediate release of the persons taken from the "China." The British Secretary for Foreign Affairs replied that the latest attempt to define by common agreement the limits within which a belligerent naval power may remove enemy persons from neutral ships on the high seas is represented by Article 47 of the Declaration of London, 1909. This article permitted the arrest of such persons if "embodied in the armed forces of the enemy," without regard to the destination of the ship on which they were found travelling. The commentary on Article 45 of the Declaration contained in the Report of the Drafting Committee of the London Naval Conference states that, on practical grounds "apart from reasons of pure law" it was agreed that the term "embodied in the armed forces of the enemy" should be considered as not including reservists not yet attached to their military units.

At the beginning of the war the British Government had adhered to Articles 45 and 47 of the Declaration of London, as interpreted by the Report of the Drafting Committee. They had taken this step as a matter of convenience, being at liberty, as the declaration was an unratified instrument, to cancel at any time their adherence, provided always that their subsequent action did not conflict with the general principles of international law. When the German authorities began to remove able-bodied persons of military age from the occupied portions of France and Belgium, the British Government felt that they could no longer accept the restrictive interpretation placed for practical reasons on the terms of Article 47 of the Declaration of London by the Report of the Drafting Committee, and that they must arrest all enemy reservists found on board neutral ships on the high seas, no matter where they might be met.

Although the U.S. Government, since their suggestion early in the war that the belligerent Powers should adopt the Declaration of London in its entirety as a code of international naval law, did not find general acceptance, had declared that it no longer considered the declaration as being in force, the Foreign Secretary said he had referred to the bearings of the declaration on this question, because Article 47 represented perhaps the only attempt to arrive at a definition, by common consent of the chief maritime nations of the law in regard to the matter. The attempt, however, was necessarily conditioned by the experience of previous wars, and the definition was reached after weighing the claims and the convenience of neutral shipping against the importance to belligerent powers, as shown by the experience of previous wars, of preventing enemy subjects from proceeding to their destination, and pursuing the hostile purposes for which they were organized.

[1] See British White Paper, Misc., No. 2 (1916), in which the measures in question are fully set out.
[2] See White Paper, Misc., No. 2 (1916).

It was therefore of the greatest importance for a belligerent power to intercept on the high seas not only mobilized members of the opposing army who might be found travelling on neutral ships, but also "those agents whom the enemy sends to injure his opponent abroad, or whose services he enjoys without having himself commissioned them."

In fact practical considerations from the belligerents' point of view had changed, and the change necessarily implied a modification in the description of enemy subjects whom it is lawful to arrest, supposing such a description can be said to have existed in any binding form.

With regard to the case of the "Trent" the British Government contended that the "China" case was of an entirely different nature from that on which the U.S. Government relied. At the date when the "Trent" case occurred no agreement had been reached as to the claim put forward by certain countries that a belligerent is entitled to remove certain classes of individuals from a neutral ship without bringing the vessels in for adjudication in the Prize Court. Since then a considerable measure of agreement has been reached on this point:—

"In any case the nature of the persons concerned in the episode of the 'Trent' was entirely different from that of the individuals removed from the 'China.' Messrs. Slidell & Mason were proceeding to Europe, according to their contention, as the diplomatic representatives of a belligerent; at that time the suggestion that the functions of a diplomatic representative should include the organizing of outrages upon the soil of the neutral country to which he was accredited was unheard of, and the removal of the gentlemen in question could only be justified on the ground that their representative character was sufficient to bring them within the classes of persons whose removal from a neutral vessel was justifiable. The distinction between such persons and German agents whose object is to make use of the shelter of a neutral country in order to foment risings in British territory, to fit out ships for the purpose of preying on British commerce, and to organize outrages in the neutral country itself is obvious."[1]

6. *Armed Merchant Ships and the Submarine.*—The subject of the legitimacy of arming merchant ships arose in the course of the war, and the death penalty inflicted on Capt. Fryatt gave a tragic importance to it, which excited British public opinion on a matter which is not so easily disposed of, from the point of view of international law, as the public at the time was led or seemed to suppose.

The British Government, on the outbreak of war, at once (Aug. 4 1914 and Aug. 9 1914) called the attention of the U.S. Government to the distinction between a merchantman commissioned to act as a cruiser and a merchantman merely armed for defence against attack. According to the British rule it was pointed out that "British merchant vessels cannot be converted into men-of-war in any foreign port, for the reason that Great Britain does not admit the right of any Power to do this on the High Seas." This is not perhaps very clearly expressed by the Government communication, which goes on, however, to state that "the duty of a neutral to intern or order the immediate departure of belligerent vessels is limited to actual and potential men-of-war, and, in the opinion of H.M. Government, there can, therefore, be no right on the part of neutral Governments to intern British armed merchant vessels which cannot be converted into men-of-war on the High Seas, nor require them to land their guns before proceeding to sea."

A certain number of British merchant vessels had been armed "as a precautionary measure adopted solely for defence."

Later (Sept. 9 1914) the British Government handed to the U.S. Government a short memorandum in justification of its action in arming merchant ships for defence and of its claim that they should enjoy the status of peaceful trading vessels in neutral ports. This memorandum, which has a certain importance, was as follows:—

"The German Government have openly entered upon the policy of arming merchant ships as commerce destroyers and even claim the right to carry out the process of arming and equipping such merchant ships in neutral harbours or on the high seas. It is in consequence of this that the British Admiralty have been compelled, in accordance with the practice followed in the great wars of history, to arm a certain number of British merchant ships for self-defence only.

"The practice of arming ships in self-defence is very old and has been ordered by Royal proclamation in England from early in the seventeenth century. During the Napoleonic wars the right to arm in self-defence was recognized by British and United States Prize Courts in the cases of the Catherine Elisabeth (British) and the Nereide (United States). The right of a merchant ship of a belligerent to carry arms and resist capture is clearly and definitely laid down in modern times. The right of resistance of merchant vessels is recognized by the United States Naval War Code, by the Italian Code for Mercantile Marine, and by the Russian Prize Regulations. Writers of authority in many European countries also recognize the right. To mention a German authority, it may be stated that the late Dr. Perels, at one time legal adviser to the German Admiralty, quotes with approval Art. 10 of the United States Naval War Code, which states "the prisoners of merchant vessels of an enemy who, in self-defence and in protection of the vessel placed in their charge resist an attack, are entitled to the status of prisoners of war." The Institute of International Law at its meeting in 1913 prepared and adopted a manual of the laws of naval warfare, Article 10 of which expressly declared that private ships are allowed to employ force to defend themselves against the attack of an enemy's ship.

"A merchant vessel armed purely for self-defence is therefore entitled under international law to enjoy the status of a peaceful trading ship in neutral ports and His Majesty's Government do not ask for better treatment for British merchant ships in this respect than might be accorded to those of other Powers. They consider that only those merchant ships which are intended for use as cruisers should be treated as ships of war and that the question whether a particular ship carrying an armament is intended for offensive or defensive action must be decided by the simple criterion whether she is engaged in ordinary commerce and embarking cargo and passengers in the ordinary way. If so, there is no rule of international law that would justify such vessel, even if armed being, treated otherwise than as a peaceful trader."

The U.S. Government replied to this memorandum by drawing up some general rules which it declared to be its intention to follow in dealing with cases involving the status of armed merchant vessels visiting American ports. These rules, which very clearly define what constitute armament for self-defence, are likely to become a precedent, and are, therefore, in view of future naval warfare, of considerable value. They were as follows:—

(*a*) A merchant vessel of belligerent nationality may carry an armament and ammunition for the sole purpose of defence without acquiring the character of a ship of war.

(*b*) The presence of an armament and ammunition on board a merchant vessel creates a presumption that the armament is for offensive purposes, but the owners or agents may overcome this presumption by evidence showing that the vessel carries armament solely for defence.

(*c*) Evidence necessary to establish the fact that the armament is solely for defence and will not be used offensively, whether the armament be mounted or stowed below, must be presented in each case independently at an official investigation. The result of the investigation must show conclusively that the armament is not intended for, and will not be used in, offensive operations.

Indications that the armament will not be used offensively are:—

1. That the calibre of the guns carried does not exceed six inches.
2. That the guns and small arms carried are few in number.
3. That no guns are mounted on the forward part of the vessel.
4. That the quantity of ammunition is small.
5. That the vessel is manned by its usual crew, and the officers are the same as those on board before the war was declared.
6. That the vessel intends to and actually does clear for a port lying in its usual trade route, or a port indicating its purposes to continue in the same trade in which it was engaged before war was declared.
7. That the vessel takes on board fuel and supplies sufficient only to carry it to its port of destination, or the same quantity substantially which it has been accustomed to take for a voyage before the war was declared.
8. That the cargo of the vessel consists of articles of commerce unsuited for the use of a ship of war in operations against an enemy.
9. That the vessel carries passengers who are as a whole unfitted to enter the military or naval service of the belligerent whose flag the vessel flies, or of any of its allies, and particularly if the passenger list includes women and children.
10. That the speed of the ship is slow.

(*d*) Port authorities, on the arrival in a port of the United States of an armed vessel of belligerent nationality, claiming to be a merchant vessel, should immediately investigate and report to Washington on the foregoing indications as to the intended use of the armament, in order that it may be determined whether the evidence is sufficient to remove the presumption that the vessel is, and should

[1] Sir E. Grey's letter to Mr. W. H. Page, March 16 1916.

be treated as, a ship of war. Clearance will not be granted until authorized from Washington, and the master will be so informed upon arrival.

(e) The conversion of a merchant vessel into a ship of war is a question of fact which is to be established by direct or circumstantial evidence of intention to use the vessel as a ship of war. (Dept. of State, Sept. 19 1914.)

The German Government on Oct. 15 1914 communicated by telegram a counter-memorandum to the U.S. Government which stated that it had learnt from "an official notice" in the *Westminster Gazette* (Sept. 21 1914) that the Department of State at Washington had ruled that ships of belligerent nations when equipped with ammunition and armament shall nevertheless be treated, while in American ports, as merchant ships, provided the armament serves for defensive purposes only. "This ruling," the memorandum stated, "wholly fails to comply with the principles of neutrality. The equipment of British merchant vessels with artillery is for the purpose of making armed resistance against German cruisers. Resistance of this sort is contrary to international law, because in a military sense a merchant vessel is not permitted to defend itself against a war vessel. . . . It is a question whether or not ships thus armed should be admitted into ports of a neutral country at all. Such ships, in any event, should not receive any better treatment in neutral ports than a regular warship, and should be subject at least to the rules issued by neutral nations restricting the stay of a warship. If the Government of the United States considers that it fulfils its duty as a neutral nation by confining the admission of armed merchant ships to such ships as are equipped for defensive purposes only, it is pointed out that so far as determining the warlike character of a ship is concerned, the distinction between the defensive and offensive is irrelevant. The destination of a ship for use of any kind in war is conclusive, and restrictions as to the extent of armament afford no guarantee that ships armed for defensive purposes only will not be used for offensive purposes under certain circumstances."

The U.S. Government replied (Nov. 7 1914) in a telegram that it dissented from the views of the German Government as above expressed in regard to the treatment to be accorded armed merchant vessels of belligerent nationality in neutral ports. The practice of a majority of nations and the consensus of opinion by the leading authorities on international law, including many German writers, supported the proposition that merchant vessels may arm for defence without losing their private character and that they may employ such armament against hostile attack without contravening the principles of international law. The purpose of an armament on a merchant vessel was to be determined by various circumstances, among which were the number and position of the guns on the vessel, the quantity of ammunition and fuel, the number and sex of the passengers, the nature of the cargo, etc. Tested by evidence of this character, the question as to whether an armament on a merchant vessel was intended solely for defensive purposes may be readily answered and the neutral Government should regulate its treatment of the vessel in accordance with the intended use of the armament. In permitting a private vessel having a general cargo, a customary amount of fuel, an average crew, and passengers of both sexes on board, and carrying a small armament and a small amount of ammunition, to enjoy the hospitality of an American port as a merchant vessel, the U.S. Government was (it contended) in no way violating its duty as a neutral. Nevertheless, it was not unmindful of the fact that the circumstances of a particular case may be such as to cause embarrassment and possible controversy as to the character of an armed private vessel visiting its ports. Recognizing, therefore, the desirability of avoiding a ground of complaint, the U.S. Government, "as soon as a case arose, while frankly admitting the right of a merchant vessel to carry a defensive armament, expressed its disapprobation of a practice which compelled it to pass an opinion upon a vessel's intended use, which opinion, if proven subsequently to be erroneous, might constitute a ground for a charge of unneutral conduct."

As a result of these representations Secretary Lansing said that no merchant vessels with armaments had visited the ports of the United States since Sept. 10. In fact, from the beginning of the World War only two armed private vessels had entered or cleared from U.S. ports, and as to these vessels their character as merchant vessels had been conclusively established. He expressed the hope that the German Government would also prevent their merchant vessels from entering the ports of the United States carrying armament even for defensive purposes "though they may possess the right to do so by the rules of international law."

The theoretical justification of the German position regarding the status of merchantmen armed solely for defence is that a non-combatant ship carrying arms is not essentially different from a non-combatant person carrying arms. In practice the really important consideration, however, was brought out by the new situation arising out of the weakness of submarine vessels for defence. A comparatively small projectile can destroy a submarine. And is not defence necessarily offence where the merchantman opens fire, though the submarine "may not have committed any hostile act such as firing a gun or torpedo"? (See British instructions of April 1915.) Moreover, may not the merchant vessel, to defend itself effectively, have to round on the pursuer and get to close quarters with him?

These considerations no doubt influenced the U.S. Secretary of State, who on Jan. 18 1916 handed a confidential letter to the British ambassador on the subject, in which he set out that in order to bring submarine warfare within the general rules of international law and the principles of humanity, without destroying its efficiency in the destruction of commerce, he believed that a formula might be found which would appeal to the sense of justice and fairness of all the belligerents.

In pursuance of the object he made the following propositions:—

"1. A non-combatant has a right to traverse the high seas in a merchant vessel entitled to fly a belligerent flag and to rely upon the observance of the rules of international law and principles of humanity if the vessel is approached by a naval vessel of another belligerent.

"2. A merchant vessel of enemy nationality should not be attacked without being ordered to stop.

"3. An enemy merchant vessel, when ordered to do so by a belligerent submarine, should immediately stop.

"4. Such vessel should not be attacked after being ordered to stop, unless it attempts to flee or to resist, and, in case it ceases to flee or resist, the attack should discontinue.

"In the event that it is impossible to place a prize crew on board an enemy merchant vessel, or convoy it into port, the vessel may be sunk, provided the crew and passengers have been removed to a place of safety."

In complying with the foregoing propositions, which, in the Secretary of State's opinion, embodied the principal rules the strict observance of which would insure the life of a non-combatant on a merchant vessel which is intercepted by a submarine, he was not unmindful of the obstacles which would be met by undersea craft as commerce destroyers. Prior to the year 1915, belligerent operations against enemy commerce on the high seas had been conducted with cruisers carrying heavy armaments. Under these conditions international law appeared to permit a merchant vessel to carry an armament for defensive purposes without losing its character as a private commercial vessel. This right was justified by the superior defensive strength of ships of war, and the limitations of armament seemed to be dependent on the fact that it could not be used effectively in offence against enemy naval vessels, while it could defend the merchantmen against the generally inferior armament of piratical ships and privateers. The use of the submarine, however, had changed these relations. Comparison of the defensive strength of a cruiser and a submarine showed that the latter, relying for protection on its power to submerge, is almost defenceless in point of construction. Even a merchant ship carrying a small-calibre gun would be able to use it effectively for offence against a submarine. Moreover, pirates and sea-rovers had been swept from the main trade channels of the seas, and privateering had been abolished. Consequently, the

placing of guns on merchantmen at the present day of submarine warfare can be explained only on the ground of a purpose to render merchantmen superior in force to submarines and to prevent warning and visit and search by them. Any armament, therefore, on a merchant vessel would seem to have the character of an offensive armament. If a submarine is required to stop and search a merchant vessel on the high seas, and, in case it is found she is of an enemy character and that conditions necessitate her destruction, to remove to a place of safety all persons on board, it would not seem just or reasonable that the submarine should be compelled, while complying with these requirements, to expose itself to almost certain destruction by the guns on board the merchant vessel. It, therefore, appeared to be a reasonable and reciprocally just arrangement if it could be agreed by the opposing belligerents that submarines should be caused to adhere strictly to the rules of international law in the matter of stopping and searching merchant vessels, determining their belligerent nationality, and removing the crews and passengers to places of safety before sinking the vessels as prizes of war; and that merchant vessels of belligerent nationality should be prohibited and prevented from carrying any armament whatever.

The American statesman added that the U.S. Government was impressed with the reasonableness of the argument that a merchant vessel carrying an armament of any sort, in view of the character of submarine warfare and the defensive weakness of undersea craft, should be held to be an auxiliary cruiser and be so treated by a neutral as well as by a belligerent.

This was a judicious and unbiased statement upon which it is difficult to improve. The advice given was not acted upon. The chief consideration in it was probably just the reason for utilizing it. In the Fryatt case Capt. Fryatt on March 20 1916, as pilot of a British unarmed merchantman, refused to stop on being summoned by a German submarine, and instead, unsuccessfully, tried to ram the submarine. He fell into German hands later on, and was tried as a non-combatant for an act of war against a submarine which was acting within its rights under international law. He was court-martialled and shot.

It is seen from the above summary of the situation that the legal relations between belligerents at sea, which have arisen out of the importation of the submarine into maritime warfare, call for precise regulation, though it is difficult to see the line on which such regulations can extricate the future from the cruelty arising, even unintentionally, from the use of this new instrument of destruction.

7. *Air Warfare.*—"Military aircraft and airmen are bound by the rules that govern belligerents generally. To be distinguishable from spies and possess the rights of prisoners of war, airmen must conform to the provisions of the Hague Regulations, wear the uniform of their country, and act in accordance with the Laws and Usage of War. They are forbidden to drop bombs on *undefended* towns or villages. In case of impending bombardment by an attacking force, it is the duty of the commanding officer to warn the authorities of the place thereof. This applies to all the attacking forces, including aircraft. In sieges and bombardments, precautions are strongly urged by the Hague Regulations to spare historic buildings, hospitals, and charitable institutions; the besieged authorities are recommended to indicate them by visible signs notified to the besiegers. All this affects the besiegers' aircraft as part of the attacking force." The above was written in the autumn of 1914.[1] This is still the law affecting aircraft.

The sense of the word "defended," at the Hague Conference of 1907, gave rise to some discussion in connexion with the special convention there adopted for the regulation of naval bombardments. Article I. of that convention forbids the bombardment by naval forces of "undefended ports, towns, villages, habitations, or buildings," to which Article II. adds the following qualification:—

"Nevertheless, this interdiction does not comprise military works, military or naval establishments, depôts of arms or war material, workshops or installations suitable to be used for the requirements of the enemy's army or fleet, and war vessels in the port. The commander of a naval force may, after summons with a reasonable delay, destroy them by cannon if no other means are possible, and when the local authorities shall not have proceeded to their destruction within the delay fixed."

As lateral damage to "innocent" property may be caused by bombardment, the second paragraph of the same article provides that in case "involuntary damage is occasioned by the bombardment," the commander of the bombarding vessel or vessels "incurs no responsibility."

Then, as there is always the contingency of the bombarding vessel not having time to comply with the prescribed formalities, "military necessity" may be alleged to justify any excesses and barbarity. "If," however, adds a third paragraph of this article, "military necessity requiring immediate action does not admit of delay, it remains understood that the prohibition to bombard the undefended town continues as set out in the first paragraph, and that the commander will take all the desired precautions to occasion the least possible inconvenience to the town." It is left, as may be noticed, to the bombarding commander to inflict, as the French original mildly enjoins, *"le moins d'inconvénients possible."*

In the above-cited first paragraph of Article II. we get a sort of definition, at any rate, of the alternative of "undefended." The presence anywhere of "military works," "naval establishments," "depots of war materials," "workshops suitable for use by the enemy, army or fleet," "war vessels in port" does not, however, make them "defences," but introduces exceptions which, even in an undefended town, the commander may destroy. In the course of the discussion on the subject at the conference of 1907, the German naval expert, Adml. Siegel, proposed to add "*installations et provisions qui peuvent être utilisées.*" Asked to explain what he meant by "*provisions*," the Admiral stated that he had more particularly in view depots of coal. He ultimately withdrew his proposal, but he did so only on the ground that "war materials" covered his point, especially as they would include coal. It was pointed out that this view only applied to coal at a seaport. In this he seems to have acquiesced. The same Admiral claimed the right to bombard a railway junction or floating dock as included under the term "*installations*"; this was not disputed. It follows that a bombarding vessel may shell a railway junction and any dock capable of serving as a repairing dock, and, in fact, anything else which can serve the purposes of an army or navy. These provisions do not say or mean that a town ceases to be undefended owing to the presence within its area of things liable to be destroyed. Thus, the question of what constitutes an "undefended town" was left without a precise definition.

As regards naval bombardment, the preamble to the convention relating to bombardment by naval forces states that its object is, as far as possible, to extend to such bombardments the principles of the regulations of 1899 concerning war on land. The words "by any means whatsoever" (Article 25) in the article of these regulations relating to bombardment cover aerial navigation. It may, therefore, be said that the rules set out for bombardment generally apply also to aerial bombardment. Assuming it to be so, to what calamities of war are the inhabitants of a city legally exposed from the air?

They may be summed up as follows:—(1) The air commanders may lawfully attack all undisguised military and naval establishments. (2) They may destroy installations capable of being used for the needs of the military and naval forces, that is, railways facilitating communication between them and wireless stations. (3) They may destroy workshops for the manufacture of materials serviceable for the requirements of army or navy.

Operations by aircraft, in short, are bound by the rules relating to bombardment generally. If carried on by craft belonging to land forces, the Hague Regulations for the conduct of war are binding on them. If carried by craft belonging to naval forces, they are subject to the Hague Convention No. IX.

[1] See Barclay, *Law and Usage of War* (London 1914).

Unfortunately, it is practically impossible to carry out the regulations except "in spirit." Barrage fire from the ground prevents hostile aircraft from descending near enough to the spot bombarded to distinguish the particular object it is intended to damage or destroy. The same difficulty applies to long-range guns. Thus, a whole town becomes *de facto* exposed to the consequences of there being in its midst, or alongside it, any military store, a garrison, an army staff, or legitimate object of attack.[1]

8. *Private Property.*—It is an unchallenged principle of international law that enemy private property should be respected. This principle was corroborated in the Hague Regulations respecting the Laws and Customs of War on Land of 1899 and 1907, even as regards occupied territory. "Private property," says Article 46 of these regulations, "cannot be confiscated." This principle was violated by all the belligerents, not only during the war but also in the Peace Treaty.

A few months after the outbreak of the war (see Trading with the Enemy Amendment Act of Nov. 27 1914) the Public Trustee in Great Britain was appointed custodian of enemy property. His duty was to hold all property placed in his custody until the end of the war for the benefit of its owner, subject to similar treatment of British property in enemy countries. An Act of Jan. 27 1916 extended these powers to those of "prohibition" and "liquidation." The Public Trustee therefore proceeded to wind up German companies and sell German property by auction, with lavish profusion. In France the first measures taken were also purely for the purpose of preservation. Sequestrators were appointed under the supervision of the judicial authorities. The German treatment of enemy property was at first the most liberal of all, but after the adoption of the British Act of Jan. 27 1916, a German decree of Aug. 29 1916 directed the winding-up of British concerns in Belgium, and, apparently by way of administrative reprisal, the same procedure was extended to enemy property throughout Germany, including Alsace-Lorraine, where forced sales were made with particular hardship, even of the property of German subjects, on the ground of family connexions with France; a violation of principle transcending all the others. The United States followed, more or less, the example of Great Britain.

On the conclusion of the war the Allies were confronted with a sort of dilemma. England and the United States had gone beyond France and had pocketed proceeds of liquidation. France had merely sequestrated the property. The simplest way out was *post hoc* to confiscate all enemy property. Hence provision in the treaties of peace (Article 297 of the Treaty of Versailles) which empowers the Allied and Associated Powers to liquidate all property, rights and interests belonging at the date of their coming into force to German and other enemy nationals or companies controlled by them within their territories, colonies, possessions and protectorates, including territories ceded to them by the Treaty.

Thus, one of the most glaring violations of international law received the consecration of a treaty of peace.

9. *Peace Methods: Mediation.*—Tenders of mediation during the war by the United States (when a neutral), and by the Pope, were declined by the Allies at its outbreak. However, Sir Edward Grey records in a dispatch to Berlin[2] that the German ambassador had said to him it was very desirable that Russia should act as a mediator with regard to Serbia. Four days later, Sir Edward suggested at Berlin that simultaneous and joint action by Germany, Italy, France, and Great Britain at Vienna and St. Petersburg might have a "mediating or moderating influence."[3] Then, on July 28, Austria-Hungary declared war against Serbia. Even in spite of this precipitation, efforts to arrive at an effective mediation were continued by Sir Edward Grey on behalf of Great Britain, and by Herr von Bethmann Hollweg, through the German ambassador in London, on behalf of Germany. It is certain that Great Britain, France and Italy were prepared to offer mediation in conjunction with Germany down to as late as July 29. Germany objected, we then learn from Italy, to the mediation of the four Powers,[4] and on the same date (July 29) the German ambassador assured Sir Edward Grey that the German Chancellor was working in the interest of mediation at Vienna and St. Petersburg.[5] Sir Edward then authorized Sir Edward Goschen to make the following statement at Berlin:—

"If the peace of Europe can be preserved and the present crisis safely passed, my own endeavour will be to promote some arrangement to which Germany could be a party, by which she could be assured that no aggressive or hostile policy would be pursued against her or her allies by France, Russia and ourselves, jointly or separately. I have desired this and worked for it, as far as I could, through the last Balkan crisis, and Germany having a corresponding object our relations sensibly improved. The idea has hitherto been too Utopian to form the subject of definite proposals, but if this present crisis, so much more acute than any that Europe has gone through for generations, be safely passed, I am hopeful that the relief and reaction which will follow may make possible some more definite *rapprochement* between the Powers than has been possible hitherto."

This was practically a further promise of mediation on the part of Great Britain for assuring the peace of Europe.

That these efforts at mediation broke down seems to have been due to the precipitation of Austria-Hungary in declaring war against Serbia, and her declining to suspend the outbreak of hostilities. The rest follows as a consequence of this precipitation: Russia's precipitation in decreeing a general mobilization, Germany's precipitate espousal of the quarrel of Austria-Hungary, etc., till the bulk of the world found itself at war, and only the United States and Spain, among greater Powers, remained free to offer any mediation at all.[6]

*Arbitration* received a considerable impetus under the treaties of peace; under Article 13 of the "Covenant of the League of Nations," the provisions of the Hague Peace Conference relating to arbitrable matters are placed within the scope of the League's activities. "In the event of any failure," says the article, "to carry out . . . an award, the Council shall propose what steps should be taken to give effect thereto." The establishment, under Article 14 of the covenant, of a Permanent Court of International Justice, though it will not afford in principle a substitute for arbitration, will, however, probably in practice largely supersede it. Nevertheless, Article 12 of the covenant provides that, if any dispute arises between members of the League, they will submit the matter to arbitration or to enquiry by the Council and they "agree in no case to resort to war," until three months after the award by the arbitrators or the report by the Council. The treaties of peace furthermore provide for the establishment of mixed Arbitral Tribunals to deal with a number of matters specified in the Treaty (see Article 304 of the Treaty of Versailles). These mixed Arbitral Tribunals are composed of three members, one nominated by the late ally and another by the late enemy in question, the third to be chosen by agreement between the two Governments concerned. A number of cases under sections III., IV., V., and VI. of the Treaty of Versailles and corresponding sections of the other treaties were referred to these Tribunals. Article 305 appoints them practically as a final court of appeal from the national courts in cases within their prescribed jurisdiction.

10. *Self-determination and Plebiscite.*—"The settlement of every question, whether of territory or sovereignty, of economic arrangement or of political relationship, upon the basis of the free acceptance of that settlement by the people immediately concerned, and not upon the basis of the material interest or advantage of any other nation or people which may desire a different settlement for the sake of its own exterior influence or mastery." This was one of the four principles laid down by President Wilson in his address of July 4 1918, and accepted by

the Allies and enemies alike as the peace preliminaries set out in Secretary Lansing's letter of Nov. 5 1918.

In accordance with this principle, the Treaty of Versailles provided for plebiscites in several cases where the population was mixed. This method was prescribed by the Treaty of Versailles for contested areas of Schleswig between Denmark and Germany (Article 109); Allenstein between Germany and Poland (Article 94); Eupen and Malmédy between Belgium and Germany (Article 34); Marienburg between Germany and Poland (Article 96); Saar Basin, between Germany and France (Article 49); and Upper Silesia between Germany and Poland (Article 88). Provisions were made for applying the same method to an area between Poland and Czechoslovakia (Teschen). In all these cases the provisions of the Treaty vary as to methods and period of voting, and in one case at least the construction of the Treaty differs. Thus under Article 88 of the Treaty relating to Upper Silesia that Treaty states that "the inhabitants will be called upon to indicate by a vote whether they wish to be attached to Germany or to Poland." The vote was taken and proved favourable to Germany. The concluding paragraph of the article, however, provides that Germany will renounce in favour of Poland "all rights and title over the portion of Upper Silesia lying beyond the frontier line fixed by the Principal Allied and Associated Powers as the result of plebiscite." This wording was interpreted by Poland to provide for the partition of Upper Silesia, whereas Germany regarded it as relating only to the line of the frontier of Upper Silesia. The wording of Article 6 of the annex, however, speaks of "the territory which is recognized should be German," and Article 5 of "the line which ought to be adopted as the frontier of Germany in Upper Silesia." And the same article provides that "regard will be paid to the wishes of the inhabitants as shown by the vote and to the geographical and economic conditions of the locality." Furthermore, Article 90 provides that "Poland undertakes to permit for a period of 15 years the exportation to Germany of the products of the mines in any part of Upper Silesia transferred to Poland in accordance with the present Treaty." Thus, although the first paragraph of Article 88 seems to imply that Upper Silesia is indivisible, the subsequent provisions of the Treaty do not bear this out. The injunction that regard be paid to "the geographical and economic conditions of the locality" might seem a firmer ground for the German case than any of the above interpretations.

The principle of *self-determination* is essentially an idea pertinent to high political development. To ask an ignorant population—which has never had the benefit of elementary education, cannot read a newspaper, and is necessarily dependent on one who has some education for its intercourse with the outer world—what its "ideals" are, is calculated, however, to turn the notion of self-determination into ridicule. The question how far a population is capable of self-determination was not considered by those who gave effect to the principles in the Treaty of Peace. Yet it was obvious that a population possessing a highly developed social and political intelligence, such as the inhabitants of Schleswig, was in a better position to express an independent wish than an illiterate population like the miners and agricultural hands of Upper Silesia.

11. *Penalties for Violation of the Laws of War.*—The Hague Convention with respect to the laws and customs of war of 1907 provides for the case in which the regulations annexed to the convention should be violated in the following terms (Article 3):—"The belligerent party who shall violate the provisions of the said regulations shall be bound, if the case arises, *to pay an indemnity*. It shall be responsible for all acts done by persons forming part of its armed forces." The words in italics, read in the French original, are *tenue à indemnité*, which may be better construed as meaning to "make amends." This article was an addition made in 1907 to satisfy the then growing public feeling that it was not enough to lay down rules, and that some sanction ought to be available against infringers.

The article confined itself to a statement of the principle and left untouched the question of the authority which is to give it effect. The universal principles of justice, however, exclude the idea that any party to a dispute should be his own judge. This entails the necessary corollary that the determination of the amends to be made shall lie with an independent authority. It was therefore with surprise that jurists learned from the Treaty of Versailles that the Allies had imposed, and that Germany had accepted, provisions in the Treaty which disregarded this principle and laid it down that only violations of the laws and usages of war by Germans should be brought to trial, and that the tribunals before which they should be brought were the military courts of their late enemy.

It is true that the German Government before signing the Treaty protested against provisions forcing Germany "to hand over to her opponents for conviction by a military tribunal any persons accused of having committed acts of violation of the laws and customs of war, even in cases where proceedings have already been instituted against these persons by German courts," on the ground that Article 9 of the German Criminal Code forbids the extradition of German subjects to foreign Governments. The Allied and Associated Powers, "if need be, would thus force upon the German Republic the alteration of an article of law which is the common property of most peoples and which, wherever it is in force, possesses the authority of a constitutionally authorized fundamental law. The refusal of this proposition was a self-evident demand of German honour."

Under the law of nations, it further argued, "only the State as bearer of the international obligation is responsible for acts in violation of the laws and customs of war. If satisfaction is to be given by the punishment of guilty individuals, the injured State itself may not convict; it can only demand the punishment of the State responsible for the guilty person." Germany had never refused and once more declared her readiness to see that violations of international law were punished with the full severity of the law; and that all accusations, from whichever party they came, would be examined impartially. Beyond this, she was prepared to leave the decision of the preliminary question, whether any act committed in the war was to be considered as an offence against the laws and customs of war, to an international tribunal composed of neutrals before which ought to be brought violations of the laws and customs of war committed by subjects of all parties to the Treaty. Germany claimed the same share in the formation of this international tribunal as the Allied and Associated Powers; but she proposed that the powers of the international tribunal be restricted to the settling of questions of international law, punishment to be reserved for the national courts.

These proposals were not agreed to, and the only alteration the German representatives obtained was that the ordinary, not the military, punishments should be inflicted on the guilty.

Articles 228–30 therefore read as follows:—

"The German Government recognizes the right of the Allied and Associated Powers to bring before military tribunals persons accused of having committed acts of violation of the laws and customs of war. Such persons shall, if found guilty, be sentenced to punishments laid down by law. This provision will apply notwithstanding any proceedings or prosecution before a tribunal in Germany or in the territory of her allies.

The German Government shall hand over to the Allied and Associated Powers, or to such one of them as shall so request, all persons accused of having committed an act of violation of the laws and customs of war, who are specified, either by name or by the rank, office, or employment which they held under the German authorities.

Persons guilty of criminal acts against the nationals of one of the Allied and Associated Powers will be brought before the military tribunals of that Power.

Persons guilty of criminal acts against the nationals of more than one of the Allied and Associated Powers will be brought before military tribunals composed of members of the military tribunals of the Powers concerned.

In every case the accused will be entitled to name his own counsel.

The German Government undertakes to furnish all documents and information of every kind, the production of which may be considered necessary to ensure the full knowledge of the incriminating acts, the discovery of offenders and the just appreciation of responsibility."

Thus the Allied and Associated Powers endeavoured to intro-

duce a new principle into the public law of Europe, viz., that the victorious Power has the right to demand the extradition of persons merely accused of violations of the laws and usages of war, without first submitting the presumptive evidence to the national jurisdiction with which, under existing principles and practice, the granting of extradition lies. It does not even profess to grant trial by an independent tribunal—not even a tribunal independent within the national area, but declares that the trial shall take place before "military tribunals." Nor does it distinguish what law is applicable. The guilty are to be "sentenced to punishments provided by law." The word "military," as has been shown, was suppressed. What law? The subjects of any state are bound by the laws of that state, not by laws of a foreign state which may be different from their domestic laws, unless the incriminated acts have been committed within the jurisdiction of the foreign state.

The Report of the Commission of the Allied and Associated Powers on the Enforcement of Penalties recommended the creation of a High Tribunal to be composed of representatives of such Powers exclusively, and that the punishment applicable should be such as "may be imposed for such an offence or offences by any court in any country represented on the High Tribunal or in the country of the convicted person." (Annex 4.)

The Japanese delegates on the commission placed a reservation on record. "A question," they said, "may be raised whether it can be admitted as a principle of the law of nations that a High Tribunal constituted by belligerents can, after a war is over, try an individual belonging to the opposite side, who may be presumed to be guilty of a crime against the laws and customs of war. It may further be asked whether international law recognizes a penal law as applicable to those who are guilty."

In a closely reasoned memorandum of reservations by the American representatives on the commission, Mr. Robert Lansing and Dr. James Brown Scott, it was pointed out that a "judicial tribunal only deals with existing laws," and that "an act could not be a crime in the legal sense of the word unless it were made so by law, and that the commission of an act declared to be a crime by law could not be punished unless the law prescribed the penalty to be inflicted"; and they concluded their memorandum as follows:—"They submit their views, rejected by the Commission, to the Conference, in full confidence that it is only through the administration of law, enacted and known before it is violated, that justice may ultimately prevail internationally, as it does between individuals in civilized nations."

Nevertheless, they submitted a statement of the principles which seemed to them should determine what may be considered inhuman and improper acts of war.

This statement is valuable as a thoughtful *résumé* for future guidance:—

1. Slaying and maiming men in accordance with generally accepted rules of war are from their nature cruel and contrary to the modern conception of humanity.
2. The methods of destruction of life and property in conformity with the accepted rules of war are admitted by civilized nations to be justifiable and no charge of cruelty, inhumanity, or impropriety lies against a party employing such methods.
3. The principle underlying the accepted rules of war is the necessity of exercising physical force to protect national safety or to maintain national rights.
4. Reprehensible cruelty is a matter of degree which cannot be justly determined by a fixed line of distinction, but one which fluctuates in accordance with the facts in each case, but the manifest departure from accepted rules and customs of war imposes upon the one so departing the burden of justifying his conduct as he is *prima facie* guilty of a criminal act.
5. The test of guilt in the perpetration of an act, which would be inhuman or otherwise reprehensible under normal conditions, is the necessity of that act to the protection of national safety or national rights measured chiefly by actual military advantage.
6. The assertion by the perpetrator of an act that it is necessary for military reasons does not exonerate him from guilt if the facts and circumstances present reasonably strong ground for establishing the needlessness of the act or for believing that the assertion is not made in good faith.
7. While an act may be essentially reprehensible and the perpetrator entirely unwarranted in assuming it to be necessary from a military point of view, he must not be condemned as wilfully violating the laws and customs of war or the principles of humanity unless it can be shown that the act was wanton and without reasonable excuse.
8. A wanton act which causes needless suffering (and this includes such causes of suffering as destruction of property, deprivation of necessaries of life, enforced labour, etc.) is cruel and criminal. The full measure of guilt attaches to a party who without adequate reason perpetrates a needless act of cruelty. Such an act is a crime against civilization, which is without palliation.
9. It would appear, therefore, in determining the criminality of an act, that there should be considered the wantonness or malice of the perpetrator, the needlessness of the act from a military point of view, the perpetration of a justifiable act in a needlessly harsh or cruel manner, and the improper motive which inspired it.

When the Powers handed in their list of persons accused and called upon Germany to deliver them up for trial, it became evident that no German Government would be powerful enough to override the refusal of the police and military to act, or of the public to coöperate in the necessary arrests. Maturer consideration of the question led the Powers to agree that it would be better to leave the trial of the accused to the Supreme Court of Germany herself. Trials eventually took place, and certain convictions were rendered and acquittals granted.

It is of the greatest value to mankind that crimes of war should be made punishable after its termination, but circumstances have shown, what was apparent from the first to unprejudiced observers, that the only proper jurisdiction before which they can be brought is one in which the final word would rest with judges accepted by both parties.

The advisory committee of jurists which was created by the Council of the League of Nations, and which sat at The Hague from June 16 to July 24 1920, recommended the institution of a world court competent to try criminals against international public order. Their resolution was for the establishment, by the Council and Assembly of the League of Nations, of a new court called the "High Court of International Justice," with jurisdiction over offences "against international public order and the universal law of nations" which shall be referred to it by the assembly or council. This court to consist of one member for each State, to be selected by the state groups in the panels of the Court of Arbitration, and to have power to determine the rules of procedure, define the crime, fix the penalty and prescribe the means of enforcing the judgment.

12. *Permanent Court of Justice.*—Article 14 of the covenant for the establishment of a League of Nations provides also for the establishment of a "Permanent Court of International Justice." The creation of such a court had been proposed by the United States at the Hague Conference of 1907, and a plan for its constitution and working was appended to the Protocol of the Convention there adopted. Under the article in question, the court is to be competent to hear and determine any dispute "which the parties thereto may submit to it."[1]

Early in 1920 the Council of the League took the question in hand, and a committee of jurists was appointed, which met at The Hague (June 16–July 24 1920) to prepare plans for the establishment of the court. The committee had before it the plan which was in principle approved by the second Hague Conference in 1907, but which had been blocked by inability to frame an acceptable method of choosing 15 judges in a manner satisfactory to small as well as great nations. In addition to this plan, 11 official projects of recent date and a larger number of non-official projects were presented to the committee. The work of the committee was urgent, the Treaty of Versailles in several places having provided for appeals to a court of international justice (cf. Part XII. of the Treaty,

[1] Article 14 reads as follows: "The Council shall formulate and submit to the members of the League for adoption plans for the establishment of a permanent Court of International Justice. The Court shall be competent to hear and determine any dispute of an international character *which the parties thereto* submit to it. The Court may also give an advisory opinion upon any dispute or question referred to it by the Council or by the Assembly." The French text is different. It reads, instead of as printed in italics, "*que les parties lui soumettront.*" The German translation follows the French text. The word "thereto" in the English text leaves no doubt as to the real meaning.

Articles 336, 337, 386; also in Part XIII., Articles 415–420, 423). The members of the committee unanimously approved of a scheme which was duly laid before the Council of the League. Its essential points are as follows:—

As regards the organization of the court (Articles 1–30) it is to consist of 11 judges and four deputy judges, elected for nine-year terms and eligible for reëlection, their salaries to be determined by the Assembly of the League, upon the proposal of the council. The president or presiding judge, to be chosen by the court itself for a term of three years, shall receive, while holding the office, a special grant to be determined in the same way. The assembly, upon proposal by the council, may increase the number of judges to 15, and of deputy judges to six.

Members of the Hague Court of Arbitration belonging to States that are members of the League shall be invited by the secretary-general of the League to form themselves into national groups for the purpose of nominating by each group not more than two persons, qualified to become judges in the Permanent Court. The nominees may be of any nationality. From the persons thus named the assembly and the council shall each elect judges and deputy judges. Those who receive an absolute majority of votes in each body are elected. Only one candidate may be chosen from any one nationality. The whole body of judges "should represent the main forms of civilization and the principal legal systems of the world."

If, after three election sessions of the council and assembly, one or more seats on the bench remain unfilled, a joint conference committee of those two bodies may name candidates for each vacant seat, and may, by unanimous agreement, present new names.

If all vacancies are not filled by this method, the members of the court itself shall complete their number by selection from among those who have received votes, either in the assembly or in the council. If there should be a tie vote among the judges the eldest judge shall have a casting vote.

During their terms of office the justices may not exercise any political functions, may not act as agent or advocate in any international case, and may not sit in any case in which they have previously taken an active part in any capacity. The members of the court, outside of their own country, shall enjoy the privileges and immunities of diplomatic representatives. They may not be dismissed from office, except by unanimous decision of the other members, formally submitted to the secretary-general of the League.

The court shall appoint its own registrar, who may, if the court please, be the same as the secretary-general of the Court of Arbitration. The court shall hold at least one session a year, meeting at The Hague where the president and registrar shall reside. A quorum of nine judges shall suffice to constitute the court.

The court shall form annually a chamber of three judges who may, when contesting parties demand it, hear and determine cases by summary procedure.

If the court contains a judge of the same nationality as one of the parties to a suit, but not of the other, the latter party may choose one of the deputy judges, if there be one of its nationality, or, if not, one from among those who have been nominated for election to the bench, who may sit as a judge in that case. If the nationality of neither party to a suit is represented among the judges, each side may select a temporary judge, as herein provided.

The expenses of the court shall be met as the Assembly of the League shall provide, upon the proposal of the council.

As regards jurisdiction and competency (Articles 31–36), disputes arising between members of the League of Nations, which cannot be settled by diplomatic means, may be brought before the court by the complainant party, and the court has immediate jurisdiction to hear and determine questions of a legal nature concerning:—

(*a*) The interpretation of a treaty.
(*b*) Any question of international law.
(*c*) The existence of any breach of an international obligation.
(*d*) The nature and extent of reparation for such a breach.
(*e*) The interpretation of a sentence passed by the court.

The court itself shall decide whether any case is included in one or more of these classifications.

The court may accept jurisdiction over disputes of any kind that the parties to the controversy agree to submit to it.

The court shall, in its decision, interpret:—

(*a*) International conventions of any sort, establishing rules recognized by the contestants.
(*b*) International custom, embodying general practice accepted as law.
(*c*) General principles of law recognized by civilized nations.
(*d*) Judicial decisions, and the doctrine of the best-qualified publicists among the various nations.

States not members of the League may bring suit in the court under conditions determined by the Council of the League, in accordance with Article 17 of the covenant.[1]

The council or assembly may refer any international question or dispute to the court for an advisory opinion. If the question so referred does not involve any existing dispute, the court shall consider the matter by means of a special commission of from three to five members; otherwise, the court shall sit as though hearing a case.

As regards procedure (Articles 37–62) the official language of the court is French, but the court may, if the contestants request it, authorize the use of another language.

A State which appeals to the court shall make its application to the registrar, who shall notify the members of the League through the secretary-general. The hearings in court shall be public, unless the court decides otherwise upon a written request of one of the parties, with reasons.

For service of notices upon persons and the procurement of evidence, the court shall apply to the Government of the State whose territory must be entered.

The court may give a decision, even though one party does not appear to defend his case. Decision shall be by majority vote of the judges present. In case of a tie, the president has a casting vote.

The decision shall give the reasons on which it is based and the names of the judges present. If there are dissenting judges, the decision shall record the fact of dissent, without giving the reasons for it. The judgment is final and without appeal. If its meaning or scope is uncertain the court shall construe it upon the request of any party.

The discovery of a new and important fact, if previous ignorance of it were not due to negligence, may be made the ground for an application for revision of judgment, but such application must be made within five years of the date of the first decision.

Before accepting an appeal for revision, the court may require compliance with the terms of the decision. The court may, if it wishes, grant the request of any State to appear in a pending suit as an interested third party.

If in any case the court is construing an international convention to which States, other than contestants, are parties, the registrar shall notify such States, and they have the right to appear in the proceedings. The judgment will then be binding upon them also.

Unless otherwise decided by the court, each party to a suit shall bear his own costs.

This report of the Committee of Jurists was presented to the Council of the League at its eighth session at San Sebastian. The council, Aug. 5, authorized the secretary-general to send a copy of the report to each Government in the League, in order that the project might be carefully studied before the council submitted the recommendations of the committee to the assembly at the meeting in November. The draft scheme worked out by this committee was adopted by the council with some slight modifications. It was subsequently passed, with further modifications, by the assembly at Geneva.

The election of the 11 judges of the court was to be carried out simultaneously by the council and by the assembly, which must agree upon a common list of names in accordance with the system proposed by the Committee of Jurists; the desires of the great Powers and the small Powers would thus be equally respected. On the other hand, the Statute of the Court, in the form in which it was adopted by the assembly at Geneva, does not establish compulsory jurisdiction. The delegates, however, adopted a kind of compromise between the supporters of compulsory jurisdiction and those of voluntary jurisdiction. One of the clauses of the statute enables the contracting States to adopt compulsory jurisdiction for certain classes of disputes.

13. *Mandates.*—A new international institution has been introduced into the domain of law in the creation of "Mandates" under Article 22 of the Covenant of the League of Nations. This article provides that colonies and territories which as a consequence of the war have ceased to be under the sovereignty of the States which formerly governed them, and are inhabited by people not yet able to stand by themselves under the strenuous conditions of the modern world, should be regarded for their well-being and development "a sacred trust of civilization." The best method, says the article, of giving practical effect thereto is that the tutelage of such peoples be entrusted to advanced nations who, by reason of their resources, their experience or their geographical position, can best undertake the responsibility and that this tutelage should be exercised by them as mandatories on behalf of the League.

The character of the mandate, the article continues, must differ according to the stage of the development of the people, the geographical situation of the territory, its economic conditions and other similar circumstances. Thus, certain com-

[1] This article provides that in such an event the non-member of the League shall be invited to accept the obligations of membership for the purposes of the dispute in question upon such conditions as the council deem to be just.

munities formerly belonging to the Turkish Empire have reached a stage of development where their existence as independent nations can be provisionally recognized, subject to the rendering of administrative advice and assistance by a mandatory until such time as they are able to stand alone. "The wishes of these communities must be a principal consideration in the selection of the mandatory." Other peoples, especially those of Central Africa, are at such a stage that the mandatory must be responsible for the administration of the territory under conditions which will guarantee freedom of conscience or religion, subject only to the maintenance of public order and morals, the prohibition of abuses such as the slave trade, the arms traffic and the liquor traffic, and "the prevention of the establishment of fortifications or military and naval bases and military training of the natives for other than police purposes and the defence of territory," and will also secure equal opportunities for the trade and commerce of other members of the League.

There are territories, says the article, such as S.W. Africa and certain of the S. Pacific Is., which, owing to the sparseness of their population, or their small size, or their remoteness from the centre of civilization, or their geographical contiguity to the territory of the mandatory, and other circumstances, can be best administered under the laws of the mandatory as integral portions of its territory, subject to the safeguards above mentioned in the interests of the indigenous population:—

"In every case of mandate, the mandatory shall render to the Council an annual report in reference to the territory committed to its charge." "The degree of authority, control, or administration to be exercised by the mandatory shall, if not previously agreed upon by the members of the League, be explicitly defined in each case by the council."

Lastly, a permanent commission was to be constituted to receive and examine the annual reports of the mandatories and to advise the council as to the observance of the mandates.

The preparatory provisions of this article had been largely carried out by 1921. It is seen that there are three kinds of mandates which have to be dealt with (*A*, *B* and *C*).

The mandate territories consist of: In Africa: German East Africa, German S.W. Africa, Cameroon, Togoland. In Asia Minor: Armenia, Mesopotamia, Palestine, Syria. In Australasia: German Samoa and the ex-German islands in the Pacific.

These mandates have been divided up as follows:—

(*A*)Mandates: the non-Turkish portions of the former Ottoman Empire (Armenia, Arabia, etc.).

(*B*)Mandates: German E. Africa, Togoland, Cameroon.

(*C*)Mandates: German S.W. Africa, Nauru, German Samoa, and other ex-German Pacific possessions.

(*A*)Mandates, it has been seen, apply to communities which, although recognized as independent, are under "the administrative advice and assistance of the League." The covenant itself provides that such mandates are to be conferred on certain communities formerly belonging to the Turkish Empire, but it seems to be held in official quarters that (*A*)mandates may be conferred on communities outside the former Turkish Empire, and the situation in 1921 with regard to Armenia and Albania was not greatly different from that with regard to Mesopotamia, Palestine, and Syria.

(*B*)Mandates, applicable solely to Central Africa, do not contemplate the ultimate establishment of an independent government, as in the case of (*A*)mandates; but it follows from the distinction between them and the (*C*)mandates that annexation is excluded. The mandatory's powers and privileges will therefore have to be very clearly defined to insure that the mandatory State will respect all local religious institutions, refrain from raising armed forces except for purposes of police and local defence, and will apply the "open door" to subjects or citizens of the members of the League of Nations.

(*C*)Mandates apply to those territories "which, owing to the sparseness of their population, or their small size, or their remoteness from the centres of civilization or their geographical contiguity to the territory of the mandatory, and other circumstances, can be best administered under the laws of the mandatory as integral portions of its territory."

Although such territories are placed under "full power of administration and legislation" of the mandatory Power or Dominion "as integral portions" of it, even they are not to be fully annexed to it, the mandate being conferred by the principal Allied and Associated Powers upon a Power or Dominion chosen by them jointly and such Power or Dominion being expressly bound, by the terms of its acceptance, to carry out the mandate on behalf of the League of Nations. Moreover, the mandatory is under the obligation to make an annual report to the council, containing full information concerning the measures taken to apply the provisions of his mandate; while "the degree of authority, control, or administration to be exercised by the mandatory shall, if not previously agreed upon by the members of the League, be explicitly defined in such case by the Council." A mandate is thus different from both an annexation and protectorate. In the case of annexation, the annexed territory is merged altogether in the territory of the annexing State, and becomes an integral part of the latter's dominions. As regards protectorates it is inconsistent with the notion of the sovereignty of the protecting State to require it to render an account of its internal administration to a group of Powers. And, in fact, hitherto, States had been reluctant to accept any responsibility for internal government in other States. Even in the case of Turkey, Article 9 of the Treaty of Paris (March 30 1856) specifically stated that in respect of the reforms proposed by Turkey, the Powers should not have the right to interfere either collectively or separately in the internal administration of the Ottoman Empire. The Treaty of Berlin (July 13 1878) did contain a clause (Article 61) in reference to Armenia which provided that the Porte should periodically inform "the Powers" of the measures taken by it to secure the Armenians against the Circassians and Kurds and the Powers undertook to *surveiller l'application* of these measures. But nothing is known to have been done to give effect to the article. We are therefore in the presence of a new departure in the law of nations, in practice if not entirely in theory.

Mandated territories, even in the case of (*C*)mandates, only form part of the sovereign domain of the mandatory Power or Dominion to the extent to which it fulfils certain conditions. If it fails to carry out the requirements imposed on it, it may be deprived of its mandate, which can then be conferred by the League of Nations on another Power or Dominion; and if any dispute regarding mandated territory arises, Articles 12 to 16 of the Covenant provide for arbitration or an inquiry by the Council of the League.

One of the chief objects of the mandate, it has been seen, is to prevent a mandated territory from becoming an annexed territory, or protectorate, or even a sphere of influence, seeing that it is subject to the maintenance of the "open door."

Drafts of mandates had by 1921 been submitted by Great Britain and France. The U.S. Government, however, intervened to prevent final settlement of their terms without its assent, on the ground that, though the United States did not form part of the League of Nations, "the colonies and territories concerned having been ceded by the Peace Treaty to all the Allied and Associated Powers, no distribution of mandates for such colonies and territories can be valid without the formal approval of the United States" (June 1921).

14. *Conclusion.*—The old rules as to contraband and blockade, in so far as regarded as a protection to neutral right, return after the war to their full effect, and England as a neutral will be entitled to regard them as the law provided to safeguard her position as a trading community against undue interference by belligerents. She may suspect danger in the equipping of merchantmen as auxiliary cruisers. She may not be favourable to unmilitarized ships carrying artillery ready for use. She may think that what under a responsible and carefully controlled system may be allowed cannot without jeopardizing the safety of the ocean be accorded to States less sensitive to the public opinion of the world. In short, the practically universal straining of the law in the World War may be found to have left behind it little change in the law itself, and the consequences of the

wild destruction at sea and on land and of the ruthlessness of the methods employed generally have been so disastrous to all concerned that progress in the future is likely to tend to such a reaction as will bring the conduct of war more closely than ever within the restrictions enforced by international law.

The World War was one of general destruction, not confined to combatant forces but directed against every form of non-combatant energy and activity, commerce, industry, innocent and guilty alike, women and children as well as men. A hope is warranted that its hardships may have some effect on the practice of civilized States in the future. At any rate it may produce a reaction in favour of older and more humane practices.

**INTERNATIONAL SCIENCE.**—International scientific organizations and conventions may be divided into four groups according to their subjects and methods of procedure. Some are intended to establish uniformity in the standards of measurements, others to advance science by coöperation, and others, again, merely to encourage personal interchange of opinion. The second group, having scientific progress for its direct objective, may be further subdivided into two, according as the coöperation is essential to secure necessary observations in different parts of the world, or is only helpful by promoting coördination and therefore economy of labour.

In the years before the World War, it was customary, for scientific purposes, to form a new international body whenever the need arose—a procedure which was natural and effective so long as each subject could be treated separately without relation to others. The disadvantages of an almost indefinite multiplication of independent bodies dealing with mutually connected subjects had, however, become apparent, and as the World War was nearing its end, efforts were made to organize international coöperation in scientific research on a better basis.

The following list (probably not complete) of the international bodies that were in existence at the outbreak of war in 1914 will give an idea of the range of subjects covered:—

GROUP I.—*Agreements on standards and methods of observation:*—
1. Commission Métrique Internationale, and Bureau International des Poids et Mesures.
2. International Committee of Electrical Units and Standards.
3. International Electro-Technical Committee.
4. International Association for Testing Materials.
5. International Committee on Atomic Weights.
6. Comité International pour la Publication annuelle de Tables de Constantes Physico-chimiques.
7. Commission on Illumination.
8. Conférences Internationales des Ephémérides Astronomiques
9. International Meteorological Committee.
10. International Solar Union (see also Group II., 7).
11. International Telegraphic Union.
12. Agreements on Radio-telegraphy.
13. Bureau International de l'Heure.

GROUP II.—*Associations formed for the purpose of investigating scientific problems in which coöperation between different nations is considered desirable:*—
1. Geodetic Association.
2. Association of Seismology.
3. Interchange of News concerning Astronomical Occurrencee.
4. International Agriculture Institute.
5. International Council for the Exploration of the Sea.
6. Marey Institute.
7. Solar Union (see also Group I., 10).
8. Scientific Sub-Committees of the International Meteorological Committee.
9. International Committee for the Investigation of the Brain.

GROUP III.—*Distribution of work bearing on the same problem for the purpose of economizing time and expenditure:*—
1. Astrographic Chart.
2. Carte Internationale du Monde au Millionième.
3. International Catalogue of Scientific Literature.

GROUP IV.—*Periodic International Congresses serving mainly for friendly interchange of views:*—
1. Mathematics.
2. Chemical Societies.
3. Applied Chemistry.
4. Mining, Metallurgy, Engineering and Economic Geology.
5. Radio-Activity.
6. Botany.
7. Geology.
8. Zoölogy.
9. Entomology.
10. Ornithology.
11. Physiology.
12. Anatomy.
13. Anthropology.
14. Medicine.
15. Hygiene.
16. Cancer Research.
17. Medical Radiology.
18. Geography.

An effort, emanating from Belgium, had been to centralize all international undertakings, and an "Office Central des Institutions Internationales" was established at Brussels. One of the publications of this office, which received no general recognition, gives what purports to be a complete list of all international congresses, unions and associations. Their total number is 279, but many of them were of a social or semi-political or trade character. Among those referring to science the following are not already included in the above list:—

1. Association Internationale des Catholiques pour le Progrès de la Science.
2. Alliance Scientifique Universelle.
3. Office International de Documentation Aéronautique.
4. Commission Permanente du Répertoire Bibliographique International des Sciences Mathématiques.
5. Institut International de Statistique.
6. Comité Maritime International.
7. Comité Juridique International de l'Aviation.
8. Association Internationale d'Agronomie tropicale.
9. Commission Internationale pour l'Enseignement des Sciences Mathématiques.
10. Association Internationale pour Promouvoir l'Étude des Quaternions.
11. Association Internationale des Chimistes des Industries de Cuir.
12. Commission Internationale pour l'Étude de la Question de l'Unification des Méthodes d'Analysis des Denrées alimentaires.
13. Bureau International d'Ethnographie.
14. Association Internationale des Botanistes.
15. Comité Ornithologique International.
16. Association Internationale des Anatomistes.
17. Commission Internationale Permanente de Détermination des Phénomènes psycho-biologiques et socio-biologiques.
18. Office International d'Hygiène Publique.
19. International Sanitary Bureau.
20. Secrétariat International pour l'Unification des Pharmacopées.

21. Association Climatologique Internationale.
22. Association Internationale contre la Tuberculose.
23. Union Internationale des Stations Électriques.
24. Bureau International des Administrations Télégraphiques.
25. Association Internationale Permanente des Congrès de Navigation.
26. Association Scientifique Internationale d'Agronomie Coloniale.
27. Union Internationale des Stations de Recherches Forestières.
28. Union Internationale de Photographie.
29. Institut International de Photographie.
30. Association Internationale des Explorateurs Polaires.
31. Institut Polaire International.
32. Laboratoire International de Physiologie du Mont Rose.

With regard to the origin and aims of some of the most important of these organizations, the following notes may be added.

GROUP I.

1. *The "Bureau International des Poids et Mesures"* was established in 1873 at Sèvres as the outcome of an international commission constituted in 1869 for the construction of metric standards. The existing convention was agreed upon in 1875. Great Britain joined the convention in 1884; the annual contribution now ranges between £200 and £300.

2. *The International Conference on Electrical Units and Standards* which was held in London in 1908 recommended that the various Governments interested should establish a Permanent International Commission for Electrical Standards. The conference requested Lord Rayleigh, then president, to nominate a Scientific Committee of 15 members to formulate a plan of such commission and, in the meantime, to direct such work as would be necessary in connexion with the maintenance and inter-comparison of standards. This committee has done much valuable work, but the intended Permanent Commission never came into being.

3. *The International Electrotechnical Commission* was formed for the purpose of carrying out a resolution of government delegates who met at the International Electrical Congress of St. Louis in 1904. This resolution was to the effect: "That steps should be taken to secure the coöperation of the technical societies of the world by the appointment of a representative commission to consider the question of the standardization of the nomenclature and ratings of electrical apparatus and machinery." The statutes of this commission were finally adopted at a meeting held in London on Oct. 22 1908. They provide for the formation by the Sectional Societies of each country of committees who shall represent that country on the International Commission. The central office is in London. Each Electrotechnical Committee provides funds for its own expenses, and contributes its share to the expenses of the central office. At the last meeting of the commission in Berlin before the war (1913) 24 countries were represented.

4. *International Association for Testing Material.*—Six international congresses were held between 1884 and 1912 with the view of introducing greater uniformity in the methods of testing materials adopted in different countries. At the last two pre-war congresses (Copenhagen, 1909, and New York, 1912) England was represented. The resolutions of the congresses are not binding on anyone, and merely serve to express the opinion of the majority. Nevertheless, the work of this organization has become of considerable importance. After the congress of 1912 a report of the British delegates advocating that the British Government should continue its official support was laid on the table of the House of Commons.[1]

5. *Joint International Committee on Atomic Weights.*—This committee grew out of an organization formed by the leading chemical societies in Europe and America. It was finally constituted in 1901–2, when the business of the committee was entrusted to four men, being representatives of the chemical societies of America, England, France and Germany respectively. The object of this committee was to draw up annual reports on work connected with the determination of atomic weights, to consider the results, and to recommend any changes in the Tables of Atomic Weights which might seem desirable for promoting uniformity in teaching and in the literature of the subject. These reports were published each year until the beginning of the war.

6. *Annual Publication of Tables of Physical and Chemical Constants.*—This is an undertaking with its headquarters at Paris, managed by an International Committee. Special committees have also been instituted in different countries (France, England, Germany, Holland, United States) to assist the work.

7. *International Commission of Illumination.*—The object of this organization, formed by scientific societies in different countries, was "to study and advance by congress and publications the knowledge and practice of the art of illumination, and to secure international agreement on matters of general concern to the science and art of illumination."

8. There were two important "*Conférences Internationales des Ephémérides Astronomiques*," one in 1896, which established greater uniformity in the adopted constants, such as that of the solar parallax and aberration, and one in 1912, which arranged for collaboration in different countries.

9. *The International Meteorological Conference and Committee.*—Beginning with 1891, the directors of the meteorological institutes and observatories of different countries met periodically in "conference," normally every ten years. The functions of the conference are to propose measures of coöperation likely to prove helpful to the development of meteorology, to bring about uniformity of ideas, and to foster good relations between the workers of different countries. The conference appoints, when it deems necessary, commissions with independent powers to promote the study of special subjects. In addition to the purely meteorological commissions appointed by the conference, there were, at the outbreak of the war, five others concerned respectively with (*a*) Scientific Aeronautics, (*b*) Terrestrial Magnetism, (*c*) Radiations, (*d*) Solar Physics, and (*e*) the Application of Meteorology to Agriculture.

10. *The International Solar Union* was an association of scientific bodies. Of these, three were domiciled in the United States, three in France, two each in Great Britain, Italy, Spain and Germany, one each in Austria, Canada, Holland, Russia, Sweden and Switzerland. Meetings were held every three years, and the business in the meantime was carried out by an Executive Committee of three members only. So far as fundamental measurements are concerned, the Solar Union has, by means of its members working independently in different countries, determined secondary standards of wavelength spread over different parts of the spectrum. It has also, through a number of committees, investigated questions relating to sunspot spectra and solar radiation. In 1913 the union decided to extend its range so as to include the whole of stellar physics.

11. *The "International Telegraphic Union,"* an institution having its "bureau" at Berne, and maintained by subscriptions from the States adhering to the union. Occasional conferences were held which led to "conventions," of which a number are in force. The bureau issues a monthly bulletin—"Le Journal Télégraphique." The union was an official rather than a scientific body, the delegates of the conferences being selected from the clerical staff of the Telegraph Office for Great Britain and its colonies.

13. *Bureau International de l'Heure.*—At an International Conference summoned by the "Bureau des Longitudes" of Paris in 1912, the following resolutions were passed:—

"1. Il est utile de chercher à réaliser l'unification de l'heure.
"2. L'heure universelle sera celle de Greenwich.
"3. Il sera utile de créer une Commission Internationale de l'Heure."

A provisional committee was formed to give effect to the last of these resolutions, and statutes were prepared in which the objects of the International Commission were defined as follows:—"To unify the 'hour' by radio-telegraphic signals or otherwise, whether for the purpose of scientific objects of high precision, or to supply the ordinary needs of navigation, meteorology, seismology, railway traffic, the postal and telegraphic services, public administration, watch-makers, private individuals, etc." An International Bureau was to be established providing for scientific assistants charged with the conduct of special researches. The cost was to be divided between the States forming the union either through their governments or some scientific body. The proposed statutes were submitted to the meeting of the International Association of Academies held in 1913 at St. Petersburg and received their unanimous support. The outbreak of the war prevented further action.

GROUP II.

1. *The International Geodetic Association* was formed by 21 contributing States and has an annual income of nearly £3,000, the subscription for the larger States being £300. According to its convention, which held for 12 years at a time, and was renewable, the Prussian Geodetic Institute at Potsdam was its Central Bureau. Its president, vice-president, and secretary belonged to different countries, and retained their position for the duration of the convention, which lapsed in 1916. Its most useful work dealt with the standardization and comparison of pendulums for gravity measurements. In later years it devoted itself almost entirely to investigations on changes of latitude.

2. *The International Seismological Association* was formed in 1903 on the pattern of the Geodetic Convention, the Imperial Seismological Station at Strassburg being selected as the Central Bureau. France, the United States and Great Britain at first refused to join this association, and the International Association of Academies appointed a committee to suggest such alterations in the proposed convention as would enable these countries to take part in the work. The principal changes proposed and ultimately accepted were: (1) that Strassburg should not necessarily remain the Central Bureau, the selection of its domicile being left to the triennial meetings, (2) that the president should only hold office for three years, (3) that a State may join through one of its scientific societies, and not necessarily through its Government, and (4) that the correspondence between the president and the organizations in each State be carried out through the secretary of the association and not through diplomatic channels as originally provided. The United States joined as soon as these changes were accepted; France

[1] Cf. Sir James Wolfe-Barry, "Forrest" Lecture of the Institution of Civil Engineers. Appendix v. (1917).

and Great Britain a few years later. The organization then consisted of 20 States, with an annual income of £1,700; the larger States contributing £160 annually. The principal functions of the bureau were to receive and distribute information and to publish systematic lists of earthquakes. Part of the funds was used in paying scientific workers appointed by the association for the purpose of carrying out special researches. The convention lapsed in 1915.

3. *International Commission for the Telegraphic Distribution of Astronomical Information.*—This was to begin with a body consisting of the directors of the principal astronomical observatories in Europe and America, which arranged for the telegraphic distribution of astronomical information. The preliminary arrangements were confirmed by a meeting of astronomers held in Vienna in 1883, when formal statutes for the future conduct of the work were adopted. The headquarters of the organization were at Kiel. The office and working expenses were met by subscriptions from the observatories receiving the information. These were originally fixed at £6 annually, but were subsequently reduced owing to the facilities given by cable companies, which transmit a certain number of messages without charge.

4. *The International Permanent Agricultural Institute.*—This was the outcome of an international meeting held at Rome during 1905 on the invitation of the King of Italy. The institute has its permanent seat at Rome, and its constitution follows lines similar to those of other international conventions. The principal object of the institute is to collect, publish and disseminate statistical information relating to agriculture, to notify new diseases in plants, and to present, if expedient, to the Governments, for their approval, measures for the protection of the common interests of agriculturists. Questions relating to the economic interests of States are excluded.

5. *International Council for the Exploration of the Sea.*—This was constituted in 1902 as a result of discussions held at conferences meeting in Stockholm and Christiania in 1899 and 1901 respectively. It confined itself to questions relating to sea fisheries in N.-European seas, and developed as an economic and political, rather than a scientific, movement. The headquarters were at Copenhagen. The countries originally adhering to the convention were Denmark, Germany, England, Finland, Holland, Norway, Russia, and Sweden. The first convention was made for five years, but annual meetings continued to be held. A number of committees were appointed to deal with different branches of the work. Large sums of money were spent on the work; the total contribution of England amounted to £70,000 (£14,000 annually).

6. *The Marey Institute.*—This institute was founded by M. Marey for the standardization and improvement of instruments used in physiological researches. Its laboratory is at Paris, and its work is controlled by an International Committee. The French Government contributed annually 25,000 fr., and the Swiss Government 1,000 fr. In addition, occasional money contributions were made by the academies of Paris, Leipzig, and St. Petersburg, as well as the Royal Society and the university of London.

7 and 8. *The Solar Union and the Scientific Sub-Committees of the International Meteorological Committee* are entered both under Groups I. and II., because their activity includes to a considerable degree scientific investigation as well as standardization.

### Group III.

1. *The International Astrographic Chart.*—The idea of forming a detailed photographic chart of the heavens originated with the late Sir David Gill, but the organization for its practical execution was mainly due to the efforts of Admi. Mouchez, who at the time was director of the Paris observatory. Its programme of work was determined upon at an international conference held in Paris in 1887. The photographs were taken at 18 observatories, of which six were in Great Britain and its colonies, four in France and its colonies, two in Italy, one each in Germany, Finland and Chile. Each country paid the expenses of its own observatories.

2. *Carte Internationale du Monde au Millionième.*—The proposal to issue a map of the world on a uniform plan was initiated at a conference held in London in 1910. In this conference only those countries took part who were represented by ambassadors at the Court of St. James. A second conference, in which other countries also took part, was held at Paris in Dec. 1913. Further details with regard to the construction of the map were settled, and it was resolved that a permanent central office should be established in England for the communication of data, interchange of information, and the publication of an annual report. The headquarters of the office are at the Ordnance Survey, Southampton.

3. *The International Catalogue of Scientific Literature.*—This catalogue, which begins with the year 1901, has its central office in London. Twenty-nine countries (counting the four Australian colonies separately) participate in the work, and most of them have established Regional Bureaux for the preliminary work of preparing the slips which are transmitted to England. The annual expenses before the war were approximately covered by the guarantees of different countries, which took the form of subscriptions for copies of the work, and the independent sales.

Sufficient has now been said to illustrate the variety both in [illegible] work and constitution of the great number of International Unions that had gradually come into existence before the World War. The freedom from tradition and convention with which scientific men interested in a particular subject combined together for a common object had undoubted advantages, as each combination could adopt the constitution best suited to its needs. But there were serious drawbacks. One was the multiplication of bodies. The above list includes five independent organizations dealing with divisions of astronomy. Though they concerned themselves with well-defined branches of the subject, and did not interfere with each other, the great increase in the number of meetings that had to be attended by the same men at different times and in different parts of the world called for some kind of unification. The formation of a more comprehensive body dealing with the whole of astronomy became, for this reason alone, almost inevitable. Then there was the question of funds, which could only be obtained with increasing difficulty, unless some particular Government showed a special and not always altruistic interest in the subject, and attained its object by diplomatic pressure. The International Geodetic Association was brought into existence through diplomatic agencies, and its constitution was vitiated by a not very effective but nevertheless annoying attempt at Government control. It was provided, for instance, that correspondence between the president and the scientific organizations in each State should only be carried out through diplomatic channels, and the association could not itself determine the seat of its Central Bureau. The delegates at the meeting were appointed by the Governments, and often received definite instructions beforehand with regard to their vote. Similar provisions were made originally in the case of the International Association of Seismology, and were abandoned only as a concession to France, England and the United States, who made this a condition of their joining.

It had been hoped at one time that a combination of the leading academies of different countries would help in systematizing international efforts. In the year 1899 a meeting was held at Wiesbaden at which representatives of the principal scientific and literary academies discussed the formation of an *International Association of Academies*, and drafted statutes for such an association. The proceedings at the meeting having been ratified by the bodies concerned, the association was formed and held five meetings at triennial intervals (Paris 1901; London 1904; Vienna 1907; Rome 1910; and St. Petersburg 1913). Twenty-four academies ultimately formed part of the association, though two of them (the Royal Society of Edinburgh and the Finnish Academy of Helsingfors), having only been elected in 1913, never took an active part in the work. The declared object of the association was "to prepare and promote scientific enterprises (travaux scientifiques) of general interest, proposed by one of the Associated Academies, and to facilitate in a general way scientific intercourse between different countries." The attitude of this new body towards other international organizations was discussed at the meeting held at London in 1904 when the following resolution was passed by 19 votes against one:—

> "That the initiation of any new international organization, to be maintained by subventions from the different states, demands careful previous examination into the value and objects of such organization, and that it is desirable that proposals to establish such organizations should be considered by the International Association of Academies before definite action is taken."

This resolution only applied to the initiation of new organizations, as the Association of Academies could not claim to exercise any control over the large number that were already in operation. Nevertheless, it was hoped that it might promote coördination by suggestion and advice.

The Association of Academies included the humanistic as well as the scientific branches of knowledge. It would be easy to point out some valuable undertakings carried out by this body, but the sum total of its effective influence was disappointing. In view of the later period of reconstruction it is necessary to allude to the main source of its weakness. Owing to the limitations of their membership and the great subdivision of our

present knowledge, the great academies of the world have lost some of their former authority, which has passed into the hands of specialized societies. While still supreme in questions of general policy, they cannot supply by themselves alone such detailed knowledge as is required in international work.

This then was the position when the World War broke out, and scientific coöperation in peaceful pursuits was inevitably in abeyance. In due course the work of reconstructing it on new lines had to be taken in hand. Informal correspondence between the secretaries of the Royal Society and the Paris Academy of Sciences was interrupted by the death of M. Darboux, a man of great experience and sound judgment combined with a wide and generous outlook. Its resumption after a short interval led to a conference of representatives of the scientific academies in the Allied countries which was held in London on Oct. 11 1918. There were two guiding principles underlying the resolutions arrived at. The first was that no results could be hoped for from any international organization necessitating friendly coöperation and personal intercourse between former belligerents until sufficient time had elapsed for the strong resentment engendered by the initiation and conduct of the war to subside; the second motive was not to lose the favourable opportunity of reconstructing the whole of the international work, by substituting a logical system for the haphazard jumble of conventions and agreements to which its spasmodic historical growth had led. It was the second as much as the first consideration which necessitated a lengthened period for the exclusion of enemy interests which were mainly responsible for the older organizations, some of these having been largely under Government control. For reasons already given, the academies had to recognize that, though they could properly be the organizing authorities, the controlling body in each country would have to be of a more representative character. The main principles were embodied in the following resolutions, which, it will be seen, make special provision for the administrative relations between public services in which coöperation of enemy countries would naturally be resumed after the declaration of peace:—

1. That it is desirable that the nations at war with the Central Powers withdraw from the existing conventions relating to International Scientific Associations in accordance with the statutes or regulations of such conventions respectively, as soon as circumstances permit; and that new associations deemed to be useful to the progress of science and its applications be established without delay by the nations at war with the Central Powers with the eventual coöperation of neutral nations.
2. That certain associations, such as the Metric Convention, depending on diplomatic agreements, be taken into consideration during the peace negotiations.
3. It is not intended that these measures be applied to agreements relating to indispensable administrative relations between public services, such as those regulating navigation, meteorological telegrams, railways, telegraphs, etc.
4. A committee of inquiry be constituted by the conference, the academies of the countries at war with the Central Powers having power to add further members. This committee shall prepare a general scheme of international organizations to meet the requirements of the various branches of scientific and industrial research, including those relating to national defence.
5. Each of the academies represented at the conference shall be invited to initiate the formation of a National Council for the promotion of the researches specified in resolution 4.
6. An International Council, having as nucleus the committee specified in resolution 4, shall be formed by the federation of the National Councils.
7. The conference, being of opinion that all industrial, agricultural and medical progress depends on pure science, draws the attention of the various Governments to the importance of theoretical and disinterested researches, which after the restoration of peace should be supported by large endowments. The conference urges similarly the creation of large laboratories for experimental science, both private and national.

At a further meeting, held at Paris at the end of Nov. 1918, representatives of the following countries were present: Belgium, Brazil, France, Great Britain, Italy, Japan, Poland, Rumania, Serbia and the United States of America. The delegates of Greece and Portugal were prevented from attending. The meeting confirmed the London resolutions and discussed the methods of giving effect to them. A committee of five delegates, representing Belgium, France, Great Britain, Italy and the United States respectively, was appointed to make more definite proposals for the proposed organizations, and the *International Research Council* was finally constituted at a meeting held at Brussels in July 1919. In the meantime the Treaty of Peace with Germany had been drafted. Article 282 of this treaty, as ultimately ratified, runs as follows:—"From the coming into force of the present Treaty, and subject to the provisions thereof, the Multilateral Treaties, Conventions and Agreements of an economic and technical character enumerated below and in the subsequent articles shall alone be applied as between Germany and those of the Allied and Associated Powers party thereto." The list of 26 conventions and agreements which form the exceptions contains only two of the scientific organizations with which we are here concerned, viz. (20), convention of May 20 1875, regarding the unification and improvement of the metric system, and (23) convention of June 7 1905, regarding the creation of an International Agricultural Institute at Rome. It would appear from this that Germany must be considered to have withdrawn from all other scientific organizations, at any rate from those which had received Government support. This view is further confirmed by Article 24 of the Covenant of the League of Nations, according to which:—

There shall be placed under the direction of the League all international bureaux already established by general treaties if the parties to such treaties consent. All such international bureaux and all commissions for the regulation of matters of international interest hereafter constituted shall be placed under the direction of the League.

In all matters of international interest which are regulated by general conventions but which are not placed under the control of international bureaux or commissions, the Secretariat of the League shall, subject to the consent of the council and if desired by the parties, collect and distribute all relevant information and shall render any other assistance which may be necessary or desirable.

The council may include as part of the expenses of the secretariat the expenses of any bureau or commission which is placed under the direction of the League.

It is a reasonable interpretation of this article that so long as Germany remained excluded from the League of Nations it was not intended to give financial support to international organizations of which Germany formed a part. The way seemed therefore open to reconstruct international scientific work unhampered by the agreements that existed before the war.

A full report of the Proceedings of the Brussels Conference having been published (Harrison & Sons, London), it is only necessary here to outline the general organization that was agreed upon. The objects of the International Research Council, which was now constituted, are defined as follows:—

(1) To coördinate international efforts in the different branches of science and its applications.
(2) To initiate the formation of international associations or unions deemed to be useful to the progress of science in accordance with Article 1. of the resolutions adopted at the Conference of London, Oct. 1918 (see page 17 of this report).
(3) To direct international scientific activity in subjects which do not fall within the purview of any existing international associations.
(4) To enter through the proper channels into relation with the Governments of the countries adhering to the International Research Council in order to promote investigations falling within the competence of the Council.

It should be noticed that, once an international association has been formed, it becomes autonomous and is independent of the parent body, subject only to the approval of its statutes and the conditions laid down for admission. The statutes exclude the Central Powers, and lay down a majority of three-quarters for the admission of all but the specified belligerent countries; but so far as countries neutral during the war are concerned, the provision is dealt with by the unanimous invitation extended to them. The following countries had joined the International Research Council by May 1921:—Australia, Belgium, Canada, Denmark, France, Greece, Holland, Italy, Japan, Mexico, Monaco, Norway, Portugal, Serbia, Spain, Sweden, Switzerland, the United States and the United Kingdom.

The statutes remain in force until Dec. 1931, but can be

altered at any time with the approval of two-thirds of the adhering countries. Different countries have voting powers according to their contributions, which depend on their population. Self-governing dominions count as independent States.

In addition to the International Research Council, unions were definitely constituted to organize international work in astronomy, geodesy and geophysics and chemistry. In each case the adhering countries constitute National Committees to superintend their part of the work. These National Committees are formed according to the decision of each country, under the responsibility either of its principal academy, or of its National Research Council (where such exists), or of some other national institution or association of institutions, or of its Government.

While the academies of most countries have been satisfied with nominating National Committees on a representative basis for the special purpose of organizing the international work, the United States has established a National Research Council, which is subdivided according to subjects, and which deals with national as well as international activities.

In extensive subjects covering a large range such as astronomy and geophysics, subdivision into groups is necessary, but each union adopts the methods that appear to them to be most effective. While astronomy works through as many as 32 standing committees, the Union of Geodesy and Geophysics has divided itself into six sections, comprising (*a*) geodesy, (*b*) seismology, (*c*) meteorology, (*d*) terrestrial magnetism and electricity, (*e*) physical oceanography, and (*f*) vulcanology.

In addition to the three unions which were actually brought into being at the time, the conference at Brussels formulated proposals for adding unions in the following subjects: mathematics, physics, scientific radio-telegraphy, geology, biological sciences, geography and, finally, bibliography and documentation. The first of these was subsequently constituted at a meeting held in Strassburg, and already counts many countries as adherents. The unions of physics and scientific radio-telegraphy also received substantial support, and it was expected in May 1921 that they would probably be constituted shortly. It seems probable that the international work, which is now established on a sufficiently uniform system to avoid overlapping and waste, while allowing complete liberty of organization within their respective spheres, will in future be carried out as efficiently as is possible in a domain which presents so many inherent difficulties.

In conclusion, and in order to avoid any misunderstanding or misapprehension as regards the general attitude of international science towards research, a declaration of policy which was adopted at the Paris Conference of Nov. 1918 may be quoted:—"The International Research Council recognizes that all great advances in science are initiated by individual efforts, and that it has become increasingly necessary to encourage these efforts. It includes, therefore, within its functions the task of actively encouraging all endeavours to supply the means and freedom necessary to those capable of conducting scientific researches of a high order." (A. S.*)

**INTERNATIONAL, THE** (*see* 14.693).—After the collapse of the original "International Working Men's Association," known as the First International, there were successive attempts to form a united International of the various socialist and labour movements, the two chief attempts being the Second International, which was formed in 1889 and broke down on the outbreak of the World War in 1914, but was afterwards revived in a mutilated form, and the Third International, which was formed in 1919 on a more exclusively revolutionary basis. In 1921 there was no single International for all the labour and socialist organizations, and the movement as a whole was in flux.

*The Second International.*—In the period following the collapse of the First International, the national labour and socialist movements grew up separately in each country with only a slight international connexion. For the 13 years between 1876 and 1889 there was no permanent international bond, but only occasional *ad hoc* international conferences of labour. These were summoned by various convening bodies, on one occasion (1888) by the British Trades Union Congress. The list of these intervening conferences is given as follows in the official record of the International Socialist Bureau: 1876, Berne; 1877, Ghent; 1881, Coire; 1883, Paris; 1886, Paris; 1888, London.

In 1889 a new step was taken by the decision of the Paris International Congress to arrange for the periodic holding of International congresses in future. The Paris Congress really consisted of two separately convened conferences, one being Marxian and the other Possibilist or moderate. Subsequent united congresses were held at Brussels in 1891, at Zurich in 1893, and at London in 1896. The starting point of the Second or "New International" is commonly taken as the year 1889.

It was not, however, until 1900, at the Paris Congress of that year, that a definite constitution was set up for the new International. The 1900 Congress established an International Socialist Bureau of representatives from each affiliated national section, together with an executive, a paid secretary, and a central office. The bureau met once a year, or more often in the case of emergency. The central office was stationed at Brussels; and the chairman, secretary and executive, who were entrusted with the task of carrying on the continuous work of the International, were composed of members of the Belgian section.

At the same Congress of Paris in 1900 were laid down the final conditions of membership of the International. By these conditions affiliation was open to—

(1) All associations which adhere to the essential principles of socialism: socialization of the means of production and exchange; international union and action of the workers; conquest of public powers by the proletariat organized as a class party.

(2) All the constituted organizations which accept the principle of the class struggle and recognize the necessity for political action (legislative and parliamentary), but do not participate directly in the political movement.

Subsequent congresses under the new regulations were held at Amsterdam in 1904, at Stuttgart in 1907, and at Copenhagen in 1910. A special conference was held at Basel in 1912 to protest against the danger of participation by the Great Powers in the Balkan war. The next regular congress was to have been held at Vienna in Aug. 1914, but was abandoned owing to the outbreak of war. The last full congress of the Second International was, in consequence, the Copenhagen Congress of 1910. That congress was attended by 896 delegates representing 23 nationalities. The total number of nationalities affiliated with the bureau at the outbreak of war was 28; and the membership was given as 12 millions.

The pre-war International was a larger organization than had so far been achieved; but its real strength lay in the national sections, and as a whole it lacked effective adhesion or unity. The compromise which gave it birth in the original fusion of the two Paris conferences of 1889 stamped its proceedings throughout. Two leading controversies occupied its attention in the years before the war. One was the question of socialist participation in non-socialist governments. The other was the question of the action of the International in the event of war. On neither of these questions was a clear answer given, although on both elaborate resolutions were passed, couched in revolutionary but vague phraseology. The decision regarding ministerial collaboration by socialists was reached at the Amsterdam Congress of 1904, and laid down that—

"The Social Democracy can accept no participation in the Government under bourgeois society, this decision being in accordance with the Kautsky resolution passed at the International Congress of Paris in 1900."

This decision would in itself appear definite; but the addition at the end introduces a covert reservation, the terms of the 1900 resolution having sanctioned the exceptional entry of a socialist into the Ministry as a "forced expedient of a temporary and extraordinary character."

The decision on the question of war is even more important for latter-day controversies. The decision was reached at the Stuttgart Congress of 1907 and reaffirmed at the Copenhagen Congress of 1910. It made the following declaration:—

"If war threatens to break out, it is the duty of the working class in the countries concerned and of their parliamentary representatives, with the help of the International Bureau as a means of coördinating their action, to use every effort to prevent war by all the means which seem to them most appropriate, having regard to the sharpness of the class war and to the general political situation.

"Should war none the less break out, their duty is to intervene to bring it promptly to an end and with all their energies to use the political and economic crisis created by the war to rouse the masses of the people from their slumbers and to hasten the fall of capitalist domination."

This decision would again appear definite: but a proposal at the Copenhagen Congress in favour of a general strike in the event of war was referred back by 131 votes to 51, with instructions to the International Bureau to remit it to the national sections for report. The Trade Union International had already refused discussion of the same proposal on the ground that it was a political question falling within the scope of the Socialist International. The subsequent fate of the proposal is worth observing as evidence of the pre-war position. The International Bureau, in accordance with instructions, circularized the national sections in 1910 with a request to report. By 1912 four replies had been received in all, from (1) the Armenian Revolutionary Federation; (2) the Commission of Resolutions of the Seine; (3) the Central Unions and Socialist Party of Denmark; (4) the Socialist Party of Finland. In 1912 the International secretary again circularized the national sections, pointing out the urgency of the subject, as Aug. 1914 (the Vienna Congress) was approaching. This was the position reached before the war.

*The International during the War.*—The collapse of the International at the outbreak of war in 1914 thus came as more of a surprise to those outside the International than to those acquainted with it. The International, despite its imposing aspirations, was in reality no more than a loose federation of political parties with no strong central authority. In the words of M. Camille Huysmans, the International secretary, describing it as he found it when he took office in 1904, it was "no more than a letter-box and a postal address, a mere medium of communication, without power and without real influence"; and he goes on to describe how efforts to improve this position met with little encouragement.

The outbreak of the war revealed that the national sections were stronger than the International. It is true that in Serbia, the country first affected by invasion, the Socialist party stood by the International and voted against the war credits; but their example was not followed. The most important national sections affected (with the exception of Russia), Britain, France, Belgium and Germany, rallied to the support of what they felt to be a war of national defence. Opposition was expressed only by minorities in each of these countries, consisting of extreme revolutionary socialists or of pacifist socialists.

The effect of the war was, accordingly, to break up the International into two sections, pro-war and anti-war. The International Secretariat was transferred to Holland; and substitute members were taken on to the Executive from the Dutch section. There followed a period of sectional conferences. In Jan. 1915, the neutral socialists met at Copenhagen and issued an appeal to the belligerent socialists to act to stop the war. In Feb. 1915, the Allied socialists met in London and passed a resolution emphasizing the necessity of continuing the war. In April 1915, the Central Powers socialists met at Vienna and passed resolutions dealing chiefly with relations after the war.

All these conferences were held with the knowledge and sanction of the International Executive, which was endeavouring by negotiation to pave the way for a full congress. But in Sept. 1915, the anti-war socialists took matters into their own hands, and held an unofficial socialist conference at Zimmerwald in Switzerland. This conference set up a permanent International Socialist Commission, which was henceforth in tacit, though not at first intended, rivalry with the official bureau. This rivalry became intensified when a second conference was held under the auspices of the commission at Kienthal in April 1916, and the revolutionary section of the anti-war socialists began to play a more dominant part.

The situation was brought to a head by the Russian Revolution of March 1917. An invitation for a full International Socialist Conference to be held at Stockholm was issued by the Petrograd Soviet in conjunction with the Dutch-Scandinavian committee which had been formed to act for the bureau. The invitation was accepted by all the principal sections, including the British Labour party, the French Socialist party, and the German and Austrian socialists. But after a protracted crisis the refusal of passports by the British and French Governments led to the failure of the project. It was at this stage that the Zimmerwaldian Commission held a separate meeting at Stockholm and finally decided on founding a new International.

In March 1918, an Inter-Allied Socialist and Labour Conference was held, which drew up a statement of war aims and communicated it to the socialist parties of the Central Powers. The replies of the latter were received during the summer of 1918, and negotiations were proceeding on these lines when the Armistice came.

*The Second International after the War.*—Immediately after the Armistice steps were taken for the reconstruction of the International under the auspices of a committee appointed by the Inter-Allied Socialist and Labour Conference of March 1918. This committee, consisting of Messrs. Albert Thomas, Henderson and Vandervelde, acting in conjunction with M. Camille Huysmans, the International secretary, issued invitations for a preliminary International Socialist and Labour Conference to be held at Berne concurrently with the official Peace Conference.

The Berne Conference was held in Feb. 1919, and was attended by delegates from 26 nations. Certain sections of the Left refused to participate, including the Russian Communist party (who had already issued their invitation for a separate conference to inaugurate a new International) and the official parties of Italy, Switzerland, Serbia and Rumania.

The Berne Conference, although not strictly a conference of the old Second International either in origin or composition, made arrangements for the resumption of the International at a full congress to be held the next year, and appointed a Permanent Commission for this purpose. The conference also passed resolutions in favour of a League of Nations based on a just peace, of national self-determination, and of an International Labour Charter. War responsibilities and Bolshevism gave rise to sharp debates. The former subject was remitted to a subsequent congress. On the latter subject a resolution denouncing the dictatorship of the proletariat and declaring democracy the only possible means of achieving socialism received a majority of votes; but the conference decided to postpone a definite decision until it had sent a mission of inquiry to Russia (for which, however, passports were refused).

The Permanent Commission appointed at the Berne Conference met at Amsterdam in April 1919, and at Lucerne in Aug. 1919. It made arrangements for the first full after-war congress to be held at Geneva in Feb. 1920, and drew up a provisional constitution. Difficulties in the way of the Geneva Congress arose owing to the growing strength of the newly founded Third or Communist International and the steady defection of parties and sections from the Second International. In consequence the Geneva Congress was postponed until Aug. 1920.

By the time the Geneva Congress was held in Aug. 1920, the Second International had come to represent in practice the right wing of the International Labour movement, although still in its basis accepting all labour and socialist organizations. Its main strength lay in the British Labour party and the German Majority socialists, together with the parties of certain smaller countries, including Sweden, Denmark, Belgium, Holland and Hungary. The official parties of America, France, Italy, Spain, Austria, Switzerland, Norway, the Balkans, Ukraine and Russia had left it, as had also the German Independent socialists, while of the British socialist organizations only the Fabian Society remained with it.

The Geneva Congress adopted for the first time a regular constitution for the International, and drew up a carefully worded programme on the economic and political side. This pro-

gramme follows more or less the lines made familiar in England by Fabian socialism, together with the recognition of a large measure of workers' control in industry. The Geneva Congress further recommended that the Secretariat should be transferred to London; and the British section was invited to undertake the task of negotiating with national socialist and labour bodies not represented, in order to secure their adherence. A negotiating commission was accordingly set up in Nov. 1920, consisting of Mr. Arthur Henderson, Mr. J. H. Thomas, Mr. J. Ramsay Macdonald and Mr. H. Gosling.

*The Third International.*—The decision to found a new revolutionary International, in view of the failure of the old Second International under the test of war, was first definitely framed by the Russian Social Democratic party (Bolshevik) at their congress in 1915, and subsequently adopted, as has been related, by the Zimmerwaldian International Socialist Commission at Stockholm in 1917. In Jan. 1919, the invitation for the first congress of the new International was issued by the Russian Communist party (the name adopted by the Russian Bolsheviks after their revolution of Nov. 1917) together with representatives of other Communist parties. This inaugural congress was held at Moscow in March 1919, and was attended by the Russian Communist party, the Norwegian Labour party, the German Spartacusbund and other smaller parties and groups. The congress wound up the Zimmerwaldian Commission, whose secretary became the secretary of the new International, and appointed an executive to arrange for the next congress, to which was left the drafting of the full constitution and conditions of admission. In the meantime a manifesto was drawn up expounding the general principles of the new Communist International, and inviting the adhesion of the revolutionary movements of the world. A summary of the principles and programme of the Communist International, as expounded in their manifesto, is given in the article on COMMUNISM.

The first congress of the new International had been a hurried meeting with little pretence at a fully representative character. The policy of precipitating its foundation had been deliberately adopted in spite of criticism as a means of crystallizing the situation in the whole International Socialist movement. This object received a considerable degree of fulfilment. Within the next twelvemonth every party had to define its attitude in relation to the new issues, and a great shifting of the centre of gravity began in the whole International movement. Section after section left the Second International, and a slower, but steady, influx passed into the Third International. By the time of the Second Congress in Aug. 1920, accredited representatives attended from parties of varying size in nearly every country.

The Second Congress had to determine the constitution and conditions of admission of the new International. This raised a new problem. The effect of the world-wide movement towards the Third International had been to produce a series of demands for admission from parties which were not fully communist in character. This applied particularly to the applications of the larger parties, the parties of Italy, Germany (the Independent Socialists), France and America. Of these Italy had joined the Third International while retaining a small reformist section within its ranks; France, Germany and America were applying for admission, although all containing anti-communist sections. The danger was that the Communist International would be swamped and become like the old pre-war Second International. Accordingly severe measures were taken to stem the tide, and a series of 21 conditions of membership were drawn up to serve as a test to sift the genuine communists from the "centrists." These measures produced the effect desired. The Italian communists broke away from their connexion with the reformist socialists (who were not themselves numerous, but received support from the majority of the party in the name of unity); the French and German parties came over only after a break with their right-wing minorities; the American communists, who were also in a majority in their party, but were expelled by the official right-wing minority, affiliated separately.

The statutes and 21 conditions of membership reveal the basis and organization of the Third International. The object of the organization is laid down as follows:—

> The new International Association of Workers is established for the purpose of organizing common action between the workers of various countries who are striving towards a single aim; the overthrow of capitalism, the establishment of the dictatorship of the proletariat and of the International Soviet Republic, the complete abolition of classes and the realization of socialism—as the first step to communist society.

In contrast with the pre-war International great stress is laid on international discipline. The World Congress is constituted as the supreme authority of the International, and is given power to confirm or revise the programme and policy of the national sections. In the intervals of the congresses this power is exercised by the International Executive, which has the right to issue obligatory instructions to the component organizations. In further contrast with the pre-war International, great stress is laid on the necessity for illegal work and the preparation for eventual armed conflict.

In addition to the statutes and conditions a series of theses were adopted by the Second Congress, outlining the communist policy and tactics in relation to Parliament, the trade unions, coöperative societies, national and colonial movements, etc. The statutes, conditions and theses, taken together, constitute the official statement of policy of the Communist International, which is held to be binding on all members.

*The Vienna International.*—While the issues of the Second and Third Internationals were agitating the socialist world, a number of parties which occupied a centre position endeavoured to start a new movement with a view to the reconstruction of the International. These parties had left the Second International, but were not prepared to enter the Third International. In Dec. 1920, a conference was held at Berne which made preparations for an inaugural congress of the new movement at Vienna in Feb. 1921. This congress was attended by the Austrian, Swiss and Hungarian parties, the British Independent Labour party, and the right-wing minorities of the French Socialists and the German Independent Socialists, the Russian Mensheviks and Socialist Revolutionaries, and one or two groups from other countries. An "International Working Union of Socialist Parties" was constituted, open to all parties not affiliated with either the Second or the Third International, and with the object of "unifying the activities of the affiliated parties, arranging common action, and promoting the establishment of an International which will embrace the whole revolutionary working class of the world." A statement on the "Organization and Methods of the Class Struggle" was adopted, which insisted on the probable necessity of expecting the use of violent measures by the capitalist class, but claimed national autonomy for each party to determine its own method of action.

Thus, by the summer of 1921, there were in existence three Internationals claiming the allegiance of the labour and socialist movements of the world.

*Bibliography.*—No standard history exists of the Socialist International as a whole. The history of the Second International before the war can only be obtained from the *International Socialist Congress Reports*, and the *Bulletin of the International Socialist Bureau*. The International at the outbreak of war is dealt with in A. W. Humphrey's *International Socialism and the War* (1915) and W. E. Walling's *The Socialists and the War* (1915); and the story is carried down to 1917 in R. W. Postgate's *The International during the War* (1918). The International after the war is dealt with in R. Palme Dutt's *The Two Internationals* (1920), which goes up to the spring of 1920. For the Third International see the *Theses and Statutes of the Communist International* (English edition, 1921) and the monthly official journal, *The Communist International*. See also R. W. Postgate's *The Workers' International* (1920), and the articles in the *Labour International Handbook* (1921). (R. P. D.)

**INTERSTATE COMMERCE** (*see* 14.711).—Subsequently to 1910 numerous Acts of the United States Congress and decisions of the Supreme Court extended the scope of Federal control over interstate commerce. The regulation of railways was made more complete, and the authority of the United States is now exercised regarding railway rates on traffic within the states when such rates affect interstate commerce. The Anti-Trust Act of 1890

was broadened and strengthened by the decisions of the Supreme Court in the oil and tobacco cases in 1911 and by the Clayton Act of 1913. In the adjustment of labour disputes between employers and employees engaged in interstate commerce the U.S. Government plays a constantly larger rôle.

*Railway Regulation.*—The Interstate Commerce Commission was given authority by the Hepburn Act of 1906 to establish reasonable maximum railway rates on interstate traffic, but could act only on complaints. By the Mann-Elkins Act of 1910, the Commission was authorized to establish reasonable rates after hearings initiated on its own motion. By this law the Interstate Commerce Act was made to apply also to telegraph and telephone companies. The most important addition to the powers of the Commission by the Act of 1910 was the authority to suspend proposed increases in rates. Rates filed by the carriers were to become effective in 30 days, but the Commission might suspend the increase for 120 days, and, if necessary, for an additional period of not exceeding six months. Another important provision of the Mann-Elkins Act gave renewed vitality to the fourth section, or the long and short haul clause, of the Interstate Commerce Act. Previously a carrier might decide whether this clause applied to any particular route, and, as the law had been interpreted by the courts, the fourth section had practically become a dead letter. By the Mann-Elkins Act no carrier may charge more for the shorter intermediate haul than for a longer haul until he has applied to the Commission and permission has been granted because of special circumstances.

The Panama Canal Act, passed in 1912, contains some important items extending Federal power over interstate commerce. It had long been thought by the public that it was the policy of the railways to secure control of competing carriers by water and force them out of existence. In response to this feeling, Congress, by the Panama Canal Act of 1912, provided that it should be unlawful for any railway company or common carrier, subject to the Interstate Commerce Act, to secure control by stock ownership or otherwise of any common carrier by water operating through the Panama Canal or elsewhere, provided the carrier by water and the railway company did or might compete with each other. The Commission was charged with the duty of deciding the questions of fact as to competition. The drastic nature of the law was somewhat modified by the provision that, if the Commission was of opinion that the public interests would be served and competition would not be prevented or reduced by the continued control by the railway company of a competing carrier by water the Commission might extend the period of control. In enforcing this provision, the Commission has compelled the trunk-line railways to sell the passenger and freight lines which they had efficiently operated upon the Great Lakes. The railways have been permitted to continue to operate steamships coastwise between New England ports. The prohibition of the use of the Panama Canal by vessels owned by a competing railway is absolute. The Panama Canal Act also gave the Commission authority, as regards interstate traffic, to require rail carriers to make physical connexion with the docks of steamship companies and to establish through routes and maximum joint rates. Rail carriers, moreover, that have entered into through arrangements with a carrier by water, operating from a port of the United States to a foreign country, must enter into like arrangements with any or all other lines of steamships operating from the same port. The purpose of this provision was to insure shippers from interior points the benefits of competition by through routes to foreign destinations.

Prior to 1915, it was the practice of railway companies by contracts in bills of lading to fix a maximum value for different articles, and in case of loss or damage the owner could collect only to the amount of the maximum value so fixed. By the Cummins Amendment (1915) to the Interstate Commerce Act carriers were made liable for the actual value of commodities. Subsequently the carriers were, however, permitted to establish a scale of rates varying with different values, provided the Commission approved.

As a result of the steady rise in cost of living after 1910, and of the more effective organization of railway employees, a series of demands was made by railway labour for increased wages. The demands were only partially satisfied by arbitration proceedings, and finally in 1916 the employees of the railways of the country threatened a nation-wide strike on Sept. 1 unless the demand for increased wages and for an eight-hour day was granted. The railway companies were unable to grant the demand and the men refused to arbitrate, although the President of the United States sought settlement by arbitration. The urgency of the situation caused the President to recommend and Congress to enact a law establishing the eight-hour day beginning Jan. 1 1917, and providing that the wages then in force should not be reduced for a period of nine months. In March 1917 this law was upheld by the U.S. Supreme Court.

On March 1 1913 Congress directed the Interstate Commerce Commission to undertake the valuation of railways to enable the Commission to regulate interstate carriers more intelligently and effectively. It is expected that the Commission will complete this work in 1923.

The most important legislation affecting the carriers enacted since the passage of the original Interstate Commerce Law of 1887 is the Transportation Act of 1920, which returned the railways to their owners March 1 (at the end of the 26 months of Government operation), provided for a more comprehensive regulation of carriers by the Commission, and established new principles to be followed in the regulation of rates, revenues and capital expenditures of the carriers. An active propaganda for the purchase of the railways by the Government was carried on during 1919 by the leaders of the railway brotherhoods and unions. The agitation received also the support of socialists and other advocates of the extension of Government functions. The movement, however, did not meet with popular approval, and Congress by a large majority decided in favour of the continuance of private ownership and the return to corporate operation of the railways.

In the Transportation Act of 1920 a new principle of rate-making was incorporated. The Commission, as previously, is the final authority as to rates. But in the future the Commission was to adjust rates with a view to enabling carriers, as a whole, to earn 5½% on the aggregate value of their property devoted to the public service. The Commission might also authorize the carriers to earn one-half of 1% per annum additional, the amount thus earned to be devoted to improvements without capitalizing the amount thus invested. Individual carriers whose net operating revenues exceed 6% were to devote one-half of the excess to building up a company reserve fund until the amount reaches 5%, and are to turn the other half of the excess over to the Government to go into a fund from which it might make advances to the carriers.

The regulation of railway securities by the Commission is authorized by the Transportation Act of 1920, which so amends the laws against combinations as to permit railway companies to consolidate with the Commission's approval. Consolidation or grouping of the railways into a limited number of systems of approximately equal strength is recognized to be an ultimate necessity, and there was some sentiment in favour of making consolidation compulsory by law. That principle, however, was not incorporated in the Act.

One of the most important features of the Transportation Act of 1920 is that providing for the adjustment of disputes as to wages and working conditions of employees. The Act makes it the duty of employers and employees to endeavor by negotiation to settle their differences. If negotiation fails, disputes as to working conditions may be referred to boards of adjustment composed of an equal number of representatives of the employer and employees. These boards may be either local, district or national. The law also provides for the appointment by the President of a Railroad Labour Board made up of nine men, three representing the public, three the railway employees and three the railway companies. Such a Board was appointed by the President in the spring of 1920, and it became active in considering many questions involving wages and working conditions.

*Intra-state Rates.*—The power of the Federal Government over intra-state rates has been extended by important decisions of the Supreme Court and by the Transportation Act of 1920. In the Minnesota Rate Case (Simpson *et al. vs.* Shepard, 230 U.S. 352), decided in 1913, the Supreme Court upheld the action of the state of Minnesota establishing railway rates within the state, although the facts showed that these intra-state rates affected the rates on interstate traffic and the revenues of the carriers engaged both in interstate and intra-state traffic. Justice Hughes, speaking for the Court, declared that the "state of Minnesota did not transcend the limits of its authority in prescribing the rates here involved, assuming them to be reasonable." But Justice Hughes was careful to point out that "if the situation has become such, by reason of the interblending of the inter- and intra-state operations of interstate carriers, that adequate regulation of their interstate rates cannot be maintained without imposing requirements with respect to their intra-state rates which substantially affect the former, it is for Congress to determine, within the limits of its constitutional authority over interstate commerce and its instruments, the measure of the regulation it should supply." In 1914 the Supreme Court was called on to consider the validity of the order of the Interstate Commerce Commission in its Shreveport decision. The business interests of Shreveport, La., had complained to the Commission that rates within the state of Texas, which had been fixed by the State Commission of Texas, were so much lower than the interstate rates that it was not possible for the merchants of Shreveport to do business in northwestern Texas. The Commission decided that the wide difference between the interstate and intra-state rates constituted an unreasonable discrimination, and the carriers were ordered to correct this, which they did by raising the intra-state to the level of the interstate charges. When the case reached the Supreme Court, the Commission's order was upheld (234 U.S. 342). The principle established by this decision was embodied in the Transportation Act of 1920. The statute provided that when the Interstate Commerce Commission finds that any intra-state rate constitutes an unjust discrimination against interstate or foreign commerce, the Commission may prescribe the maximum or minimum intra-state rate thereafter to be charged. The limitation by the Federal Government of the power of the states over railway charges within their respective territories was not accepted by the states without contest. A test case was pending in the Supreme Court in 1921.

*Amendments to the Anti-Trust Act of 1890.*—Prior to 1911, the Supreme Court by a series of decisions (*see* 14.711) had defined the scope of the Anti-Trust law of 1890; but while the Act had been sustained, the net effect of the interpretations given to the law had been to limit its effectiveness. However, in the oil and tobacco cases decided in 1911 (221 U.S. 1–106 and 106–193) the Supreme Court adopted a "rule of reason" formulated by Chief Justice White, which gave greater flexibility to the Act and promised to make the law more effective. In a previous decision involving railway combinations, the Supreme Court had interpreted literally the language of the statute, and had not considered whether the combination was reasonable or in harmony with sound public policy. This interpretation had made the statute almost a dead letter as far as regulating combinations. In the oil case, the Supreme Court, speaking through Chief Justice White, said: "It becomes obvious that the criterion to be resorted to in any given case, for the purpose of ascertaining whether violations of the section have been committed, is the rule of reason guided by the established law and by the plain duty to enforce the prohibitions of the Act, and thus the public policy which its restrictions were obviously enacted to subserve." The Court held, in effect, that the purpose of the law was to prevent undue restraint of every kind and that it did not deny to individuals the right to enter into contracts when the right was not improperly exercised.

This interpretation of the Anti-Trust law was unsatisfactory to the extreme opponents of industrial combinations, and it was thought by many that Congress should define combinations and monopolies. In response, the Clayton Act of 1913 was passed, prohibiting, under specified provisions, discriminations in prices and containing numerous other sections intended to make the general provisions of the Anti-Trust Act of 1890 more specific. It is doubtful, however, whether the Clayton Act has really strengthened the Act of 1890. Labour unions and organizations of farmers are exempted from the provisions of the Anti-Trust law. Interlocking directorates of banks are prohibited, and it is made unlawful for a corporation engaged in interstate commerce to acquire control by stock ownership of another corporation engaged in interstate commerce when such acquisition will lessen competition. Carriers engaged in interstate commerce are prohibited, after two years from the passage of the law, from dealing in securities or supplies or from making construction contracts amounting to more than $50,000 with a corporation, firm or partnership having on its board of directors or as one of its officers a person who is at the same time a director or officer of the common carrier. This provision was suspended until after the conclusion of the World War, but was in force in 1921.

The most important decision of the Supreme Court subsequently to 1911 was its finding in the case of the United States against the Steel Corporation, March 1 1920 (251 U.S. 417). By this decision, the largest of all industrial combinations was held not to be a violation of the Sherman Anti-Trust Act. It was not shown that the Steel Corporation had unduly limited competition. The Court decided that it "should consider not what the corporation had power to do or did but what it has power to do and is doing." It reached the conclusion that the public interest would not be served by requiring the dissolution of the Steel Corporation, but that, on the contrary, its dissolution might result in a material disturbance to American foreign trade.

*Adjustment of Labour Disputes.*—The Erdman Act of 1898 was amended by the Newlands Act of July 15 1913, and more adequate machinery provided for mediation and arbitration of labour disputes. The Erdman Act had provided for voluntary conciliation upon the initiative of the chairman of the Interstate Commerce Commission and the Commissioner of Labor. If conciliation failed, the parties might submit their controversy to arbitration. In that case a board of three men was provided, one arbitrator selected by each side, these to choose the third arbitrator, or, if they failed, the third arbitrator to be chosen by the chairman of the Commission and the Commissioner of Labor. Both the railway companies and their employees objected to submitting their disputes to such a small board, and the Newlands Act therefore provided for a board of five to nine men and also created a board of mediation and conciliation composed of a commissioner and two other designated officials of the Government. A series of important arbitration proceedings was held under the Newlands Act, but by 1916 the railway employees had become dissatisfied with the results of arbitration and made a demand on the carriers for the establishment of an eight-hour day and for a general increase in wages. The carriers resisted and the deadlock was broken by the passage of the Adamson Act in Sept. 1916, establishing the standard eight-hour day in the railway service, and providing for a commission to decide upon wages. There was much popular dissatisfaction with the Adamson Law, which was hurriedly enacted by Congress under the pressure of a threatened labour crisis. The Supreme Court the following spring held the law to be constitutional, and the Adamson Law has definitely established the standard eight-hour day in the railway service (243 U.S. 232). The Newlands Act and the machinery it created have been supplemented and in fact supplanted by the labour provisions of the Transportation Act of 1920. Whether the machinery created by this Act would work satisfactorily had not been fully determined in 1921, but the success of the Board in averting a threatened strike on Nov. 1 of that year gave the Board increased popular support.

For details as to statutes, consult *Barnes' Federal Code* (1919) and the supplement (1921). The most important decisions of the Supreme Court interpreting the power of the Federal Government over intra-state railway rates are Simpson *et al. vs.* Shepard, 230 U.S. 352; Houston East and West Texas Railway Co., and Houston and Shreveport Railway Co. *et al. vs.* United States, 234 U.S. 342. The most recent significant decisions of the Supreme Court interpreting the Anti-Trust Law are Standard Oil Co. *vs.* United States, 221 U.S. 1; United States *vs.* American Tobacco Co., 221 U.S. 106; United States *vs.* U.S. Steel Corporation, 251 U.S. 417, and the Adamson Law Case, Wilson *vs.* New, 243 U.S. 232. (E. R. J.)

**INTESTINAL STASIS** (*see* 8.263; 19.924; 19.430; 1.33).—In abdominal surgery during recent years some of the principal advances have been due to the increased attention given to the study of *chronic intestinal stasis*, a term which comprises a sequence of changes which affect the entire gastro-intestinal canal. They are in the first instance mechanical in character and are due to the delay in the evacuation of the contents of the intestine. Later the accumulation of material in the large bowel leads to stagnation of the chyme in the small intestines and to its infection by organisms. These germs extend upwards through the ileum, jejunum and duodenum, and foul their contents from which the body obtains its nutrition. The material absorbed from the infected contents of the small intestine contains toxins and perhaps organisms. These may be in a quantity sufficient to escape excretion and alteration by the liver and kidneys. They are carried in the blood-stream and supply the cells of all the tissues of the body with a medium which rapidly produces degenerative changes in them. This infection of the contents of the small intestine by organisms is a matter of the most serious importance in its bearing on the health of the individual.

*The Mechanical Changes in the Large Bowel* in chronic intestinal stasis usually originate early in the lifetime of the individual. When the napkin of the infant is discarded, the child is educated to expel the faeces only once a day, so that the product of a whole 24 hours' digestion is collected in the distal portion of the large bowel and especially in its pelvic segment. The bulk of faecal matter in these circumstances appears to be greater than this section of the bowel can accommodate without undergoing alterations in form. Changes in the intestine and in its connexion to adjacent structure develop. These vary in character with the vitality of the subject. In one extreme of low vitality the colon elongates and dilates, and consequently loses in expulsive power. The elongation of the pelvic colon affords a serious obstacle to the evacuation of its contents. Infective processes in the mucous membrane also produce a condition of spasmodic obstruction. In the other extreme, in the more vigorous subject, lines of resistance are crystallized as bands or membranes which tend to retain the bowel in position and to oppose its distension and elongation. These bands are generally distributed along the concavity of the large bowel and reach a high state of development at certain definite points. At first they perform a useful function but later, as they contract, they obstruct the lumen of the bowel and tend to shorten life. These deviations from the normal are characteristic of two extreme types of intestinal stasis, within which all varieties and combinations exist.

A matter of great importance is that the cases included in the first group do not get cancer of the large bowel any more than they get carcinoma of the stomach and oesophagus, while those in the second group are very liable to the formation of cancer at any of the points of obstruction produced by the acquired bands or in the situation of the muscle at the junction of the pelvic colon and rectum, or about the *sphincter ani*. Another point is that the consistence of the contents of the large intestine varies greatly throughout its length; while in the caecum and ascending colon it is of a fluid or pasty consistence, in the descending, iliac, and pelvic portions of the colon it is usually firm and may be very hard. Therefore the physical character of the faecal matter is a matter of importance in the consideration of its effects upon and its capacity to pass through any portion of the bowel whose lumen is materially constricted. The explanation of the varying frequency of cancer in the two extreme types is obvious. To exert traumatism at the seat of constriction it is necessary that there should be sufficient thrust produced by the muscular wall of the bowel, and again the mechanical effect of that thrust varies directly with the bulk and consistence of the portion of the intestinal contents which is forced against the partly obstructed segment of bowel, and with the degree of the obstruction.

In the first group the very elongated bowel with its feeble muscular wall, with its inflamed mucous membrane and its very scanty contents, exerts but a slight effect upon the mucous membrane at the junction of elongated loops of colon, the kinking or obstruction by membranes being non-existent in these cases. Instead of developing excessive power by the hypertrophy of the muscle coat of the

bowel the proximal colon gives up the struggle readily, dilates and prolapses. In the second group the bowel is not elongated, its wall is hypertrophied, the faecal contents are abundant and bulky, and the obstruction is acute and well defined. In the first group the enfeeblement of the muscle coat of the bowel resulting from the extreme degree of intestinal auto-intoxication eliminates the mechanical factor which in the case of the large bowel is responsible for the formation of cancer, but by causing degenerative changes in the breasts, uterus, ovaries and other organs, it renders them much more liable to cancer.

The ileal effluent is controlled and material is dammed back in the small intestine as the result of overloading of the caecum by its stagnating contents. The distension and dilatation of the caecum produce a twist or obstruction of the terminal ileum, or the ileum is constricted by an appendix which is anchored to the back of the mesentery, forming what is called a "controlling appendix," or by an ileal kink due to the contraction of an acquired ligament or band. The weight of the stagnating contents of the small intestine exerts a drag upon the duodeno-jejunal junction. If, as is frequently the case, this angle is abrupt it is readily blocked, so that the passage of the contents of the duodenum into the jejunum is obstructed and dilatation and inflammatory change take place in the duodenum. The pylorus becomes spastic and the stomach dilates and hypertrophies. Inflammatory changes arise in the mucous membrane about the pylorus over the area in which the contents of the stomach are forcibly impacted and about the centre of the lesser curvature where strain is greatest. Later these infected areas are liable to become cancerous.

*Toxic Changes in Chronic Intestinal Stasis.*—Carrel has demonstrated that the several tissues of the body can grow and live indefinitely, provided they receive nutriment and are efficiently drained. Any interference with the drainage of effete products or with the supply of suitable nutriment causes the death of the growing tissue.

While most of the changes which take place in the tissues of the body in stasis are due to the effect of the deleterious products circulating in the blood stream, some are consequent upon the extension of infection from the duodenum along the ducts of the liver and pancreas. The latter are evidenced as inflammatory changes in the ducts and tissues of the liver; as gall-stones acting mechanically and producing obstructive symptoms, ulceration and cancer; and as changes in the pancreas which are degenerative, inflammatory and finally cancerous.

The most conspicuous consequences of the effects of intestinal auto-intoxication are:—(1) *Loss of fat.*—This in the woman is a factor of even greater importance than in a man, since she depends on it largely for the beauty of her curves and for the support of her viscera and especially her pelvic organs. (2) *Changes in the skin.*—The skin is stained, especially about the eye-lids, side of the neck, axillae, groins, and about the labia and thighs. This staining is accentuated in areas exposed to friction. The skin becomes wrinkled. Hairs appear on the cheek, upper lip and chin, also over the externs or surfaces of the fore-arm and the legs. The perspiration is pungent and offensive. The breasts become nobbly in their upper and outer segments, cysts are formed later and spread through the whole breast, cancer develops readily in these degenerated organs. (3) The *circulation* is very defective, so that the extremities and ears are cold even in moderately warm weather. The temperature of the body is always subnormal. The heart undergoes many changes due to degeneration of its muscle. The walls of the arteries become atheromatous, impairing the circulation of the blood through the tissues. The changes in the coronary arteries produce the condition called angina pectoris, while the inelasticity and fragility of the cerebral vessels render them liable to rupture in the soft tissues of the brain. (4) The *wasting of the muscles* which occurs early in stasis is responsible for a great variety of symptoms. It affects both the voluntary and the involuntary muscles. Perhaps the earliest evidence of loss of power in the voluntary muscles is afforded by the loss of thoracic respiration, the patient depending for the oxygenation of the blood upon the more reflex and less exacting action of the diaphragm and abdominal muscles. The attitude of rest which is assumed in consequence is very disfiguring. It is interesting to note that this condition of abdominal respiration precedes, and is responsible for, the development of the deformities which are due to the fixation and later the exaggeration of "resting postures," which are thus indirectly due to the auto-intoxication of chronic intestinal stasis. They are "dorsal excurvation," "flat-foot," "lateral curvature," and "knock-knee." (5) The *muscle of the intestine* with its ganglia and mucous membrane degenerate and their function becomes still more defective. (6) The *uterus* falls back and twists or bends, forming the various flexions and versions with which the gynaecologist is so familiar. (7) The *voluntary muscles* waste and become soft and friable. They tear easily when operated on.

*Changes in the Nervous System and in the Eyes.*—The effect of auto-intoxication upon the brain and nervous system is very striking. Headache, varying in intensity, is a common symptom. Neuralgias are frequent and may involve a great variety of nerves. They may be very intense. Rheumatic pains are constantly complained of. The patient, while sleeping badly, may find it difficult to keep awake during the day. On awakening in the morning the feeling experienced may be that of extreme exhaustion, no benefit having been derived from the night's rest. The most distressing symptom of intestinal auto-intoxication is the mental depression which so frequently accompanies it. It varies in severity from a feeling of incapacity to one which not infrequently leads the sufferer to attempt to terminate an existence which has become intolerable. All efforts at mental concentration are futile, while any physical exertion is followed by a period of complete exhaustion. These patients become introspective, and women especially are liable to become intensely religious.

The term *neurasthenia* is very often applied to this condition of the nervous system. In some degree it is an almost invariable symptom of stasis. The patient loses control, and fits of irritability or of violent passion are not infrequent. Such a person is difficult to live with. Many are supposed to be stupid, dull, inattentive or even imbecile. This feature is more marked in the growing child, who is often at the bottom of the class and may be severely criticized or punished in consequence.

The eyes are always affected. They afford an excellent and very delicate indication of the degree of auto-intoxication and the changes they undergo are of great value to the observer.

*Changes in the Kidneys.*—The eliminating organ on which, after the liver, most stress is thrown is the kidney. Upon it devolves the strain of getting rid of abnormal toxins and organisms, together with an excessive amount of by-products. The changes which the kidney may undergo are most variable, some being slow and almost imperceptible in their progress, while others are very acute. They include the types of Bright's disease, which probably vary with the nature of the organisms infecting the chyme. The kidney eliminates organisms, such as *bacilli coli* and others, into the urinary tract, through which they may be discharged painlessly and without affording any evidence of their presence.

The removal of fat results in the prolapse of the viscera, and especially of those that are dependent on it for support. The kidneys drop and their functions are impaired in consequence. The outflow of urine is obstructed by the angulation of the ureter at its junction with the pelvis or over a vessel, and hydronephrotic conditions result. The venous flow from the kidney is similarly obstructed, and in consequence the organ becomes gorged with blood and very sensitive. As it lies upon the hard floor formed by the iliac fossa its sensitiveness is increased by every movement, and the pain and distress which ensue are considerable.

*Changes in the Thyroid and Ductless Glands.*—In stasis the thyroid becomes enlarged at the onset, and later may shrink so much that it cannot be felt by the fingers. It would seem reasonable to argue by analogy from the effect of stasis on the thyroid that the pituitary and adrenal glands behave in a similar manner in their attempt to meet the damage to structure and the drain upon their function that must result from the supply to their cells of blood heavily contaminated with toxic matter. In the case of the adrenal this is supported by the remarkable pigmentation of the skin which develops in stasis, especially in those of the brunette type.

*The Importance of Intestinal Auto-intoxication in the Aetiology of Other Diseases.*—The depreciation in the vitality of the tissues renders them liable to be invaded and occupied by organisms which would not be able to obtain a foothold except for the lowered resisting power which results from stasis.

In young life the lymphatic tissues of the naso-pharynx are those most susceptible to infection. Later in life the gums about the teeth are constantly exposed to invasion by organisms which probably grow in the food which collects in this situation. This infection is described as pyorrhoea. When it is advanced its products infect the circulation, while the purulent material being swallowed increases the putrefactive and other changes in the gastro-intestinal tract.

Diseases which ensue on account of the lowered vitality of the tissues are: Tubercle, rheumatoid arthritis, Still's disease, Addison's disease, Raynaud's disease, diabetes, exophthalmic goitre, adenoma of the thyroid, ulcerative colitis, microbic cyanosis, asthma, dementia precox, paralysis agitans, disseminated sclerosis, infective endocarditis, and many skin diseases.

This list of diseases might be added to largely, but the number is sufficient to illustrate the view that they are due to infection of the tissues of a toxic subject by organisms or other deleterious matter which could not obtain a foothold in one whose drainage system is efficient. (W. A. La.)

**INVERFORTH, ANDREW WEIR,** 1ST BARON (1865– ), British ship-owner and administrator, was born at Kirkcaldy April 24 1865. He was educated at Kirkcaldy and afterwards adopted a business career, founding in 1885 the firm of Andrew Weir & Co., ship-owners and merchants, of London and Glasgow. Having made a large fortune in business, in April 1917 Mr. Weir entered Mr. Lloyd George's government as surveyor-general of supply at the War Office, and held this post until Jan. 1919, when he became Minister of Munitions and Supply. The same year he was sworn of the privy council and raised to the peerage, being also awarded the American D.S.M.

**IOWA** (*see* 14.732).—The pop. of Iowa in 1920 was 2,404,021; in 1910, 2,224,771; an increase of 8·1%, as against a decrease of 0·3% in the preceding decade. In 1915 the native whites of

native parentage numbered 1,422,464; those of foreign or mixed parentage 654,855, and the foreign-born whites 264,003. The negro pop. was 16,744. There were in 1920 43·2 inhabitants per sq. m. as against 40 in 1910. In 1920 the urban pop. was 36·4% of the whole.

There were seven cities having a pop. of over 25,000, as follows:

| | 1920 | 1910 | Increase per cent |
|---|---|---|---|
| Des Moines . . | 126,468 | 86,368 | 46·4 |
| Sioux City . . . | 71,227 | 47,828 | 48·9 |
| Davenport . . . | 56,727 | 43,028 | 31·8 |
| Cedar Rapids . | 45,566 | 32,811 | 38·9 |
| Dubuque . . . . | 39,141 | 38,494 | 1·7 |
| Waterloo . . . . | 36,230 | 26,693 | 35·7 |
| Council Bluffs . . | 36,162 | 29,292 | 23·5 |

*Agriculture.*—In 1909 Iowa led all states in crop acreage and was second to Illinois in crop value. In 1919 the aggregate crop acreage in Iowa was 20,420,374, and the value of all crops $890,391,299; two states, Texas and Kansas, outranked Iowa in acreage, Texas alone in crop value. In 1919 Iowa was first among the states in the acreage, production and total value of both corn and oats, and was outranked only by New York in the production of hay. Iowa's corn crop in 1909 was 341,750,460 bus. valued at $167,622,834 from 9,229,378 ac.; in 1919 371,362,393 bus. valued at $501,339,232 from 9,006,733 acres. The oat crop in 1909, from 4,655,154 ac., was 128,198,055 bus. valued at $49,046,888; in 1919 the yield had increased to 187,045,705 bus. valued at $140,284,289 from 5,484,113 acres. In 1920 Iowa led in the value of domestic animals, was surpassed by Texas alone in the number of cattle on farms, and led in the number of horses and swine on farms. The value of domestic animals was $585,889,568 in 1920 as against $393,003,196 in 1910. The number of cattle on Iowa farms in 1920 was approximately 4,567,708 and of horses 1,386,522; while in the number of swine Iowa had increased from 7,545,853 in 1910 to 7,864,304 in 1920 (11% of the whole number for the United States). The number of fowls reported in 1920 was 28,352,515, valued at $27,779,633.

*Manufactures, Mining and Transportation.*—Meat-packing continued to lead manufacturing industries, the value of products of slaughtering and meat-packing having increased from $59,045,232 in 1909 (U.S. Census) to $221,692,868 in 1919 (*Iowa statistics of Manufactures*, for the year 1919). In 1909 and in 1914 Iowa ranked sixth among the states in the value of this product. The second industry in value in 1919 was that of food preparations, including the production of cereals and breakfast foods. The product in 1909 was valued at approximately $9,795,000, but by 1919 had increased to $80,583,382. The value of foundry and machine-shop products increased from about $14,064,000 in 1909 to $40,632,692 in 1919, and the value of butter, cheese, and condensed milk from approximately $25,850,000 in 1909 (when Iowa ranked third among the states) to $49,201,934 in 1919. The value of the production of buttons in 1909 was $4,000,000; $4,794,422 in 1919. The value of all manufactured products was $259,237,637 in 1909; $698,035,251 in 1919.

The most important mineral product in Iowa is bituminous coal; in 1910 the value was $12,682,106; in 1918 $24,703,237. The value of clay and clay products in 1918 was more than five million dollars. In 1919 cement was valued at $7,798,347, and gypsum products at $2,403,012. The mileage of steam roads was 9,781·65 m. in 1910, and on Dec. 31 1918, according to the 1919 report of the Railroad Commissioner, 9,841·17 miles. The mileage of interurban electric lines, however, had increased from 373·92 m. to 512·13, or about 37%.

*Education.*—The Federal census of 1910 credited Iowa with the smallest percentage of illiteracy of any state in the Union (1·7%). In 1920, Iowa still maintained her illiteracy had been reduced to 1.1%. State aid became an important factor in the development of public schools in the decade following 1910. Legislation granting such aid to large, centrally located, consolidated schools, replacing small scattered ones, fostered development and stimulated local endeavour. At the close of 1920 there were 430 consolidated districts, including about 25% of the area of the state and taking care of approximately 50,000 pupils. In 1911 state aid was granted by law to high schools offering normal training courses for the training of rural teachers. In 1918 172 schools in the state were maintaining such courses. In 1917 a state board for vocational education was established to take advantage of the provisions of the Smith-Hughes Act of Congress, offering Federal aid for vocational education. A law, enacted in 1919, provided for part-time schools for the benefit of children between the ages of 14 and 16 working on employment certificates. The establishment of these schools was required where there were 15 eligible pupils in the district; at least eight hours of instruction per week, between the hours of 8 A.M. and 6 P.M., must be given; and the attendance became compulsory. The educational progress of the state is shown in the reports of Dr. Leonard P. Ayres upon surveys made for the Russell Sage Foundation. In 1910 a tabulation of the states on the basis of 10 educational items led to a final relative rating in which Iowa ranked thirtieth. A similar rating in 1918 gave Iowa seventh place.

*Legislation.*—The only constitutional change made during the decade 1910–20 was an amendment ratified by the people in 1916. It fixed the time of the general election for that year on the same day as the presidential election, the time of election thereafter to be determined by the General Assembly. In 1916 a constitutional amendment extending suffrage to women was submitted to the electors of the state but was defeated. The process of amendment was again under way when the Federal suffrage amendment was adopted in 1920. The vital portions of the "mulct tax" law of 1894 (*see* 14.734) were repealed by the General Assembly in 1915, thus restoring statutory prohibition in Iowa, but a prohibitory amendment to the state constitution was voted down by the electors in Oct. 1917. The constitution of 1857 provided that in 1870 and every ten years thereafter the question, "Shall there be a Convention to revise the Constitution, and amend the same," should be submitted to a vote of the electors of the state, and in case of a favourable vote the General Assembly should provide by law for the election of delegates. In the election of 1920, for the first time, the vote showed a majority in favour of a convention.

The General Assembly in 1913 passed an Employers' Liability and Workmen's Compensation Act, to be administered by an industrial commissioner; and at the same session a Mothers' Pension Act was passed, providing for the granting to widowed and indigent mothers of sums not to exceed $2 per week for each child under 14 years of age. In 1915 the Perkins Law was passed providing that crippled children of poor parents might be sent to the hospital of the medical college of the state university for free treatment. In 1917 an appropriation was made by the General Assembly for the erection and equipment of a hospital at Iowa City for such children. Two years later the General Assembly provided that adults as well might be sent to Iowa City for free medical and surgical treatment. In 1917 the General Assembly established at Iowa City a child-welfare station for the consideration of conditions and measures.

An important development was the farm bureau movement. By 1917 organizations among farmers in the state were numerous, and in that year the General Assembly passed an Act providing that where a farm-improvement association in any county had among its members 200 farmers or farm owners and had raised $500 in annual subscriptions, the county board of supervisors was authorized to contribute $2,500 for the employment of a county agent. A law in 1919 modified the amount and terms of the payment by the county, and made the contribution mandatory. The movement gained rapid headway, county associations being established for the betterment of both social and economic conditions and the improvement of agricultural methods. In 1920 there was a farm bureau in each county and two in Pottawattamie county, 100 in all, with 100 county agents, and a membership of over 100,000. Iowa had become the leading state in the Union in the development of this movement. There was also a considerable growth within the state of a farmers' educational and coöperative union which had over 20,000 members in 1920.

*Government and Finances.*—The commission plan of government, authorized in 1907 for cities of 25,000 or more inhabitants, was made applicable in 1911 to cities of 7,000 and in 1913 to cities of 2,000 or more inhabitants. By 1920 nine cities had organized under the commission plan: Burlington, Cedar Rapids, Des Moines, Fort Dodge, Keokuk, Marshalltown, Mason City, Ottumwa and Sioux City. In 1915 the General Assembly passed Acts allowing cities to organize their municipal government under either of two city-manager plans. One of these plans—which represents only a slight variation from the mayor-council type—had been adopted by 1920 in a number of the smaller communities. The other plan, patterned closely after that of Dayton, O., had in 1920 been adopted by only two Iowa cities—Dubuque and Webster City.

In 1913 the number of Supreme Court judges was increased from six to seven; the number of district judges increased from 53 in 1910 to 64 in 1920. The General Assembly in 1913 provided that Supreme, District and Superior Court judges should be nominated and elected on a non-partizan ticket, but in 1919 the nomination and election of judges was restored to a party basis.

In the interests of a shorter ballot, in 1913 the State Superintendent of Public Instruction, the clerk of the Supreme Court and the Supreme Court reporter were made appointive officers. In 1917, however, the State Superintendent of Public Instruction was restored to the list of elective officers. In 1911 the office of commerce counsel was created, the incumbent to be appointed by the Board of Railway Commissioners and to serve as expert counsel for that Board. In 1913 the Department of Insurance was created, headed by a commissioner, and in 1917 a State Banking Department was organized and the office of Superintendent of Banking created. In 1915 a State Board of Audit and a State Board of Accountancy were created, and the office of Document Editor was established to relieve the Secretary of State. The road administration was reorganized in 1913 when the General Assembly established a highway commission consisting

of the dean of engineering of the State College of Agriculture and Mechanic Arts and two appointive members. Highway legislation in 1919 divided the highways into primary and secondary systems, and arranged for the distribution of Federal and state aid funds for the hard surfacing of primary roads.

The state and local taxes together for the year 1910 amounted to $32,500,045; in 1919 they had increased to $80,495,235. The total income of the state alone from all sources for the year ending June 30 1910 was $4,337,528; for the year to June 30 1920, $20,225,742.

*History.*—The history of Iowa in the decade 1910-20 was marked by no economic or political changes of great importance. The state remained predominantly agricultural. Although its manufactures increased in importance, it was little disturbed by industrial controversies. The supremacy of the Republican party in politics was not seriously questioned. Owing to a split in the Republican party in 1912, the Democratic candidate for president received the electoral vote of Iowa, but the state returned to the Republican ranks in 1916, and in 1920 cast an overwhelming vote for Harding for president and for Nathan E. Kendall for governor. Throughout the decade U.S. Senator Albert B. Cummins continued to represent the state. The death of Senator Jonathan P. Dolliver in 1910 caused a vacancy which was filled temporarily by the appointment of Lafayette Young. In 1911 William S. Kenyon was chosen to fill the position and was reëlected in 1913 and 1918.

The adjutant-general of the state estimated in 1919 from official sources that nearly 110,000 men from Iowa served in the army, navy and marine corps in the World War. The total amount raised in Liberty and Victory loans in Iowa was $508,935,000. In the Third and Fourth Liberty loan campaigns Iowa was the first state in the Union to exceed its quota. Republican governors were elected or reëlected every two years, incumbents being: Beryl F. Carroll, 1909–13; George W. Clarke, 1913–7; William L. Harding, 1917–21; Nathan E. Kendall, 1921– .

(J. C. P.)

**IRELAND, JOHN** (1838–1918), American Roman Catholic prelate (*see* 14.742), died at St. Paul, Minn., Sept. 25 1918. He urged full support when America entered the World War, and in May 1917 delivered a patriotic address in St. Paul before some 50,000 people assembled to bid farewell to a large body of recruits on their departure for training.

**IRELAND, JOHN** (1879– ), English musical composer, was born at Bowdon, Cheshire, Aug. 13 1879, the son of Alexander Ireland, editor and proprietor of the *Manchester Examiner*. He was educated at Dinglewood preparatory school, Colwyn Bay, and Leeds grammar school, and afterwards entered the Royal College of Music. Later he was organist to St. Luke's Church, Chelsea, and obtained the degree of Bachelor of Music at Durham University in 1908. His earliest published work was the *Phantasy* trio for piano and strings (1908), followed by sonatas in D minor and A minor for violin and piano and a second trio in one movement. In 1913 appeared an orchestral work *The Forgotten Rite*. His other works include *Decorations* (1914) and *Rhapsody* (1915) for piano; Four Preludes for pianoforte (1915); a trio in E minor (1917); a piano sonata in E (1919) and a series entitled *London Pieces* (1917–20); together with a vast number of songs and much church music.

**IRELAND** (*see* 14.742).—On March 31 1911, the pop. of Ireland amounted to 4,390,219. Since the preceding census the pop. had decreased by 1·7%, the smallest decrease on record. In the preceding decade, Leinster had increased its numbers by 0·8%, while Ulster diminished by 0·1%, Munster by 3·8% and Connaught by 5·6%. The urban pop. (1,470,595) continued to grow at the expense of the rural (2,919,624); Dublin and Kildare were the only counties to show an increase in the decade, while the city of Dublin increased 6·4% to 309,272, Rathmines and Rathgar 17·1% to 38,190, Pembroke 13·4% to 29,260, Belfast 10·4% to 385,492, Cork 0·7% to 76,632, Londonderry 2·3% to 40,799, Limerick 0·7% to 38,403, Waterford 2·5% to 27,430, and Galway, alone of the larger towns, decreased 1·3% to 13,249. The agricultural class fell to 780,867, the industrial to 613,397, and the domestic to 170,749, while the professional class rose to 141,134, and the commercial to 111,143; 2,572,929 were classed as indefinite and non-productive.

The 1911 census gives the latest definite figures available up to 1921; but the Registrar-General's annual return of births and deaths combined with the emigration statistics, gave an estimated total pop. of Ireland in 1920 at 4,470,000. Table 1 gives the annual figures.

TABLE 1.—Vital Statistics

| Year | Births | Deaths | Marriages | Emigrants |
|---|---|---|---|---|
| 1906 | 103,536 | 74,427 | 22,662 | 35,344 |
| 1907 | 101,742 | 77,334 | 22,509 | 39,082 |
| 1908 | 102,039 | 76,891 | 22,734 | 23,295 |
| 1909 | 102,759 | 74,973 | 22,650 | 28,676 |
| 1910 | 101,963 | 74,894 | 22,112 | 32,457 |
| 1911 | 101,578 | 72,475 | 23,473 | 30,573 |
| 1912 | 101,035 | 72,187 | 23,283 | 29,344 |
| 1913 | 100,094 | 74,694 | 22,266 | 30,967 |
| 1914 | 98,806 | 71,345 | 23,695 | 20,314 |
| 1915 | 95,583 | 76,151 | 24,154 | 10,659 |
| 1916 | 91,437 | 71,391 | 22,245 | 7,302 |
| 1917 | 86,370 | 72,724 | 21,073 | 2,111 |
| 1918 | 87,304 | 78,695 | 22,570 | 980 |
| 1919 | 89,325 | 78,612 | 27,193 | 2,975 |
| 1920 | — | — | — | 15,531 |

*Religion.*—At the census of 1911, Roman Catholics in Ireland numbered 3,238,656 (a decrease of 70,005 in ten years), Protestant Episcopalians 574,489 (5,600 decrease), Presbyterians 439,876 (3,400 decrease), and Methodists 61,806 (200 decrease). Roman Catholics amounted to 83·1% of the pop. in Dublin city, 71% in co. Dublin, 25·4% in Belfast, and 33·1% in N.E. Ulster.

*Railways.*—The total authorized capital of Irish railways on December 31 1919 was £45,354,724, of which the amount raised, including loans and debenture stock, was £44,240,055. The receipts in that year reached £9,392,599 and the expenditure £7,607,534, leaving a net revenue of £1,785,065. Ordinary passengers numbered 24,581,699, workmen 3,914,400, season-ticket holders 20,016, and 786,672 were carried free on behalf of the Government. The total mileage run was 20,521,942. The total of merchandise carried was 6,028,110 tons, and live stock 3,991,547.

*Agriculture.*—Table 2 shows the amount of land under the principal crops, and their estimated yield for the year 1920. The number of acres under flax in the year 1919 was 95,610, producing 13,720 tons. The hay crop for the same year was estimated at 4,809,645 tons taken from 2,520,096 acres. The hay crop for 1920 was estimated at 5,547,271 tons.

TABLE 2.—Crops, 1920

| | Extent in acres | Estimated Yield, cwts. |
|---|---|---|
| Wheat | 50,252 | 751,333 |
| Oats | 1,332,050 | 18,682,309 |
| Barley | 206,888 | 3,225,700 |
| Rye | 5,580 | 67,812 |
| Turnips | 276,507 | 82,149,240 |
| Mangels | 77,447 | 24,910,140 |
| Cabbage | 28,409 | 6,352,260 |
| Potatoes | 584,316 | 39,718,200 |

Table 3 shows the number and size of holdings in Ireland in 1918.

TABLE 3.—Agricultural Holdings, 1918

| Size | Leinst'r | Munst'r | Ulster | Conn't | Ireland |
|---|---|---|---|---|---|
| 1 ac. | 38,809 | 33,403 | 33,895 | 8,717 | 114,824 |
| 5 | 12,752 | 9,327 | 15,964 | 8,302 | 46,345 |
| 10 | 10,317 | 7,983 | 27,480 | 18,747 | 64,527 |
| 15 | 8,162 | 6,870 | 24,819 | 19,411 | 59,262 |
| 30 | 17,906 | 20,072 | 48,496 | 36,498 | 122,972 |
| 50 | 13,224 | 20,486 | 24,683 | 14,594 | 72,987 |
| 100 | 13,132 | 22,374 | 15,540 | 6,629 | 57,675 |
| 200 | 6,929 | 9,885 | 4,123 | 2,338 | 23,275 |
| 500 | 2,947 | 2,897 | 1,145 | 1,161 | 8,150 |
| | 657 | 472 | 322 | 517 | 1,968 |
| Total No. of Holdings | 124,835 | 133,769 | 196,467 | 116,914 | 571,985 |

The figures in Table 3 are not comparable with those published for years prior to 1910. In many cases farms in Ireland extend into two or more townlands, and in former years that portion of a farm in each townland was enumerated as a separate holding. The total number of holdings published was therefore somewhat too large. A change was made in the method of enumeration in 1910.

Of the holdings in 1918, 372,815 were owned and 199,170 rented. These 571,985 holdings were held by 561,807 separate occupiers.

*Agricultural Coöperation.*—On March 31 1920 there were, under the auspices of the Irish Agricultural Organization Society, 334 creameries, 101 auxiliary creameries, 371 agricultural societies, 136 credit societies, and 96 other societies. The total membership was 135,669, and the total turnover for the 686 societies for which figures were available was £11,158,583. This is approximately equal in value to £4,463,433 in 1914 in which year the actual turnover was £3,666,724. The total quantity of milk received by the creameries had, however, fallen from 92,300,561 gal. in 1914 to 78,463,271 gal. in 1919.

*Land Laws.*—Up to March 31 1921 the rents of 383,145 holdings, representing 11,394,275 ac., had been fixed for a first statutory term with an aggregate reduction of 20·7 % on the old rents; 144,133 holdings representing 4,439,026 ac. for a second term with an aggregate reduction of 19·3 %; and 6,123 holdings representing 198,364 ac. for a third term with an aggregate reduction of 9·1 %.

On the same date, under the Land Act of 1903, advances amounting to £63,030,264 had been made to 174,053 tenants for the purchase of their holdings on 6,937 estates; 1,005 estates with 33,066 tenants and a total purchase money of £8,594,952, were still pending; and 3,685 applications for advances amounting to £1,247,127 had been refused. The Estates Commissioners had further purchased 909 estates direct from their owners for £8,483,941, and 17 estates, whose purchase money was estimated at £69,720, were under consideration. The Congested Districts Board had purchased 283 estates for £2,920,197, and four estates estimated at £25,990 were under their consideration.

In 1907 an Evicted Tenants' Act was passed to enable the Estates Commissioners to acquire untenanted land compulsorily for the purpose of providing holdings for tenants who or whose predecessors had been evicted from their holdings since 1878. Over 13,000 persons applied for reinstatement, of whom over 3,500 were reinstated, and the remainder rejected after inquiry into their claims.

The Irish Land Act of 1909 relieved Irish ratepayers of the liability of making good the loss caused by the flotation of stock to finance the 1903 Act at a discount. It substituted a graduated bonus varying inversely with the number of years' purchase of the tenant's holdings for the fixed bonus of the 1903 Act, payment of future purchase agreements in 3 % stock for the cash payment of the previous Act, and offered extra facilities to vendors who were willing to accept 2¾ % stock in total or partial payment of their claims in respect of pending purchase agreements.

Under this Act, up to March 31 1921, advances amounting to £4,870,788 stock were made to 17,375 tenants for the purchase of their holdings on 2,050 estates, and applications from 5,550 tenants for £1,117,016 stock to purchase their holdings on 414 estates remained outstanding. The Estates Commissioners had further purchased 245 estates for £813,481 stock and £92,723 cash, and 83 estates estimated at £398,735 stock and £182,487 cash were under consideration. The Congested Districts Board had purchased 446 estates for £2,154,417 stock and £2,457,046 cash, and had under consideration 214 estates estimated at £1,603,892 stock, and £114,185 cash. On lands purchased by the Estates Commissioners under the Irish Land Acts 1903–9, up to March 31 1921 25,325 tenants had holdings vested in them and were paying annuities on a total purchase money of £7,861,528. On lands purchased by the Congested Districts Board, 9,227 holdings had been vested for a total purchase money of £1,872,515.

In all, under these Acts, a sum of £74,004,992 had been advanced in cash, £10,057,975 in 2¾ % stock, and £7,976,435 in 3 % stock.

In Nov. 1920 a bill was introduced into the House of Commons to complete the operation of land purchase in Ireland. It made provision for fixing an appointed day not less than two and a half years and not more than three years from the passing of the Act. Up to that date landlords would be at liberty to enter into agreements for sale to their tenants as under the Acts of 1903 and 1909. On the appointed day, all tenanted agricultural land, with certain specified exceptions, was to vest in the Congested Districts Board or the Land Commission, according to the area in which it is situated. The land was to be resold to the tenants at a standard price fixed at such a figure that the annuities on it calculated at 5¼ % would give the tenants in each county the same average reduction of their judicial rents (or, on non-judicial holdings, of rents calculated on the same principle as judicial rents) as had been enjoyed by other tenants in the same county who had purchased their holdings under the Act of 1903. The purchase money of all sales was to be paid in 5 % bonds. To this was to be added a sliding-scale bonus, varying inversely with the number of years' purchase of the holdings; and where agreements were made between the passing of the Act and the appointed day, this bonus might be increased by 1 %. Untenanted land in Congested Districts Counties was to vest in the Congested Districts Board at a price fixed by that body subject to a right of appeal to the Judicial Commissioner. This measure did not reach the Statute Book; but it was understood that a bill, substantially identical with it, would be introduced at a later date.

*Textiles.*—In 1907 (the last statistics available in 1921) the linen industry employed 75,692 operatives. In 1919 the number of spindles was 955,171 and the number of power looms 37,601. There are some twenty hosiery factories and as many tweed mills working in the country; the export of wool in 1919 decreased to 11,595,808 lb. The poplin trade is still practically confined to Dublin, the value of exports for 1920 being estimated at £20,000.

*Fisheries.*—In 1918 17,502 men were engaged in the fishing industry, the number of vessels in use being 4,717. The total capture of sea fish, excluding salmon, was 760,986 cwt., valued at £993,421. Shellfish was also taken to the value of £64,815; 12,006 persons were engaged in the salmon industry.

*Other Industries.*—In 1910 the number of gal. of spirits distilled in Ireland was 10,758,965, in 1915 10,249,436, and in 1919 11,076,516. The number of bar. of beer produced in Ireland in 1910 was 3,059,210, in 1915 3,412,520, and in 1919 1,806,046.

There has been little change in the mining industry. In 1918, 30,548 tons of iron ore were taken from the Antrim mines, and 92,001 tons of coal were extracted, valued at the pit mouth at £99,051. In 1917 5 tons of zinc were produced from zinc ore for the first time in Ireland, and in 1918 the production was 18 tons.

The export of biscuits for the 12 months ending Jan. 1921 was 10,990 tons against a pre-war average of 16,466 tons; of butter, 26,441 tons as against 36,110; of cheese, 5,832 tons as against 301; of bacon and ham 37,698 tons as against 55,232; of eggs, 8,986,268 great hundreds as against the pre-war average of 6,358,171 great hundreds; of condensed milk 7,813 tons as against 13,388; of margarine 3,592 as against 3,319; of stout, beer and porter, 376,332 tons against 214,717; of home-made spirits (including industrial spirit) 36,971 tons as against 33,399 tons.

*Shipbuilding.*—In 1920, 33 vessels were built in Ireland of an aggregate tonnage of 147,695, as compared with the 1919 tonnage of 222,955. Of these, 21 vessels of a tonnage of 116,543, were built at Belfast. The total tonnage in 1911 was 183,390, in 1912 163,481, in 1913 130,899 and in 1914 256,547. In 1915, 1916, and 1917 the tonnages were 38,095, 10,900 and 78,936 respectively, exclusive of Government vessels. In 1918 the total tonnage was 182,356.

*Commerce and Shipping.*—The most important part of the cross-Channel trade is still the export of cattle and other animals, particulars of which are given in Table 4. In 1918 the number of vessels registered at Irish ports was 809, tonnage 325,491. In the same year the vessels entering and clearing with cargoes in the colonial and foreign trade numbered 212 with a tonnage of about 444,000, and the vessels entering and clearing in the trade between Great Britain and Ireland numbered 30,522, tonnage over 9,350,000.

TABLE 4.—Exports of Animals

| Year | Cattle | Sheep | Swine | Total |
|---|---|---|---|---|
| 1909–13* | 812,688 | 708,280 | 276,525 | 1,797,493 |
| 1919 | 765,251 | 507,145 | 192,540 | 1,464,936 |
| 1920 | 926,836 | 591,816 | 158,877 | 1,677,529 |

*Average of five years.

Table 5 shows the value of the direct foreign imports and exports (*i.e.* without transhipment at a port in Great Britain) for the last two pre-war years, and for the two years after the war. Table 6 shows the total trade.

TABLE 5.—Imports and Exports

| Year | Imports | Exports |
|---|---|---|
| | £ | £ |
| 1912 | 17,088,219 | 1,338,340 |
| 1913 | 17,332,408 | 2,119,383 |
| 1919 | 26,341,725 | 1,936,710 |
| 1920 | 42,590,409 | 1,555,862 |

TABLE 6.—Total Irish Import and Export Trade

| Year | Imports | | Exports | |
|---|---|---|---|---|
| | Value at prices in the year of importation | Value at 1904 prices | Value at prices in the year of exportation | Value at 1904 prices |
| | 1,000£ | 1,000£ | 1,000£ | 1,000£ |
| 1904 | 55,345 | 55,345 | 49,815 | 49,815 |
| 1905 | 57,009 | 57,095 | 51,423 | 50,863 |
| 1906 | 58,794 | 57,523 | 56,035 | 53,445 |
| 1907 | 63,022 | 59,075 | 59,190 | 54,522 |
| 1908 | 60,190 | 56,829 | 57,445 | 53,732 |
| 1909 | 65,155 | 59,486 | 60,959 | 54,792 |
| 1910 | 66,431 | 59,624 | 65,896 | 56,966 |
| 1911 | 67,610 | 60,322 | 65,071 | 56,323 |
| 1912 | 73,953 | 63,221 | 67,168 | 56,708 |
| 1913 | 74,467 | 62,986 | 73,877 | 60,627 |
| 1914 | 74,125 | 61,176 | 77,311 | 63,243 |
| 1915 | 87,257 | 59,124 | 84,463 | 58,372 |
| 1916 | 104,517 | 56,619 | 107,171 | 58,716 |
| 1917 | 119,181 | 49,785 | 133,805 | 56,715 |
| 1918 | 126,016 | 44,167 | 152,931 | 50,569 |
| 1919 | 158,716 | 50,081 | 176,032 | 51,175 |

The figures for 1919 have been further analyzed as follows:—

| | Imports | Exports |
|---|---|---|
| | £ | £ |
| Farm Produce, Food and Drink Stuffs . . . | 55,244,605 | 93,709,173 |
| Raw Materials . . . | 24,433,511 | 6,776,687 |
| Manufactured Goods . | 79,037,828 | 75,545,621 |

*Crime.*—In non-political crime the latest year for which statistics are available is 1918, when 1,181 persons were committed for trial and 737 convicted, as against 1,414 and 918 respectively in the previous year. Of the 737 convicted, 169 were for offences against the person, 95 for offences against property with violence, 355 for offences against property without violence, 25 for malicious injury to property, 31 for forgery and offences against the currency, and 62 for other offences.

In the courts of summary jurisdiction there has been a notable decline in the number of cases of assault and drunkenness. These numbered 14,624 and 76,860 respectively in 1907, 13,085 and 64,322 in 1910, 12,869 and 59,519 in 1913, 9,397 and 40,488 in 1916, while in 1917 they sank to 7,161 and 24,788, and in 1918 to 6,899 and 13,235.

Amongst political outrages up to May 7 1921 there were 75 courthouses destroyed, 541 police barracks destroyed, 285 police barracks damaged, 3,138 raids for arms, 309 policemen killed, 491 policemen wounded, 102 soldiers killed, and 238 soldiers wounded.

*Poor Law.*—The number of persons in receipt of indoor and outdoor relief fell steadily from 1906 to 1914, the last year for which total figures have been published. In 1906 562,269 persons were relieved at a total annual cost of £1,070,181, in 1907 557,138 at £1,048,465, in 1909 588,222 at £1,105,328, in 1911 553,796 at £1,022,125, in 1913 499,588 at £1,033,863, and in 1914, 471,563 at £1,032,979.

*Education.*—In the 1911 census the age of nine years was taken as the datum line for those who could read and write, instead of the age of five years and upwards which had been previously adopted; 88% could read and write, 3% could read only, and 9% could neither read nor write. Approximately 582,446 persons, or 12.2% of the pop., were returned as being able to speak Irish; of these, 16,873 could speak "Irish only" and 565,573 could speak English and Irish.

In the year 1919, 7,316 boys and 4,803 girls presented themselves for the Intermediate Examination; of these, 3,819 and 2,340 respectively passed. About £42,000 was paid to secondary schools in grants and £6,413 to students in prizes. At the end of 1920, there were about 7,900 national schools in Ireland, the average number of pupils on the rolls being about 700,000. The Government grant for the year ending March 31 1921 was £4,469,811.

During the session 1919-20, 1,403 students attended Trinity College, Dublin; 1,095 attended Queen's University, Belfast; 1,332 attended University College, Dublin; 660 attended University College, Cork, and 270 attended University College, Galway.

TABLE 7.—Revenue

| Year | Customs | Excise | Estate Duties Stamps etc. | Prop. and Inc'me Tax | Post Office | Miscellaneous | Total |
|---|---|---|---|---|---|---|---|
| | 1,000£ | 1,000£ | 1,000£ | 1,000£ | 1,000£ | 1,000£ | 1,000£ |
| 1907 | 2,610 | 5,607 | 967 | 999 | 1,060 | 156 | 11,399 |
| 1908 | 2,679 | 5,579 | 986 | 996 | 1,094 | 144 | 11,478 |
| 1909 | 2,611 | 5,420 | 1,001 | 1,019 | 1,088 | 147 | 11,285 |
| 1910 | 2,742 | 4,487 | 977 | 388 | 1,110 | 142 | 9,846 |
| 1911 | 3,103 | 5,826 | 1,470 | 1,825 | 1,155 | 139 | 13,519 |
| 1912 | 3,013 | 5,668 | 1,262 | 1,206 | 1,207 | 132 | 12,489 |
| 1913 | 2,951 | 5,599 | 1,324 | 1,167 | 1,317 | 146 | 12,505 |
| 1914 | 3,006 | 5,842 | 1,415 | 1,162 | 1,368 | 140 | 12,945 |
| 1915 | 3,179 | 6,360 | 1,374 | 1,570 | 1,379 | 131 | 13,995 |
| 1916 | 3,920 | 8,231 | 1,399 | 2,912 | 1,474 | 144 | 18,083 |
| 1917 | 4,340 | 6,822 | 1,286 | 7,048 | 1,462 | 137 | 21,098 |
| 1918 | 4,251 | 4,291 | 1,592 | 9,833 | 1,545 | 129 | 21,646 |
| 1919 | 6,081 | 7,838 | 1,818 | 13,410 | 1,869 | 128 | 31,148 |

TABLE 8.—Expenditure

| Year | Civil Charges | Collection of Taxes | Post Office | Total |
|---|---|---|---|---|
| 1907 | £6,226,500 | £243,000 | £1,209,000 | £7,678,500 |
| 1908 | 6,312,000 | 242,000 | 1,256,000 | 7,810,000 |
| 1909 | 7,105,500 | 250,000 | 1,312,000 | 8,667,000 |
| 1910 | 9,077,500 | 270,000 | 1,365,000 | 10,712,000 |
| 1911 | 9,642,000 | 298,000 | 1,404,500 | 11,344,500 |
| 1912 | 9,799,500 | 269,000 | 1,465,500 | 11,533,500 |
| 1913 | 10,279,000 | 299,000 | 1,559,000 | 12,137,000 |
| 1914 | 10,417,000 | 318,000 | 1,622,000 | 12,357,000 |
| 1915 | 10,692,000 | 319,000 | 1,645,000 | 12,656,000 |
| 1916 | 10,603,000 | 315,000 | 1,679,000 | 12,597,000 |
| 1917 | 10,700,000 | 308,000 | 1,678,000 | 12,686,000 |
| 1918 | 11,002,000 | 317,000 | 1,683,000 | 13,002,000[1] |
| 1919 | 11,312,000 | 329,000 | 1,896,000 | 13,537,000 |

[1] Exclusive of £8,624,500 on supplementary civil votes.

*Finance.*—For the last four years for which figures were available in 1921, there was a surplus of income over expenditure to the Imperial Treasury from Ireland of £5,332,000, £11,080,000, £13,863,000, and £15,113,500 respectively. Tables 7 and 8 give details.

The total amount of loans, exclusive of closed services, made by the Commissioners of Public Works up to March 31 1919 was £29,367,575, of which £20,027,511 had been repaid as principal, £12,645,401 as interest, and £472,061 remitted.

On June 30 1920, the amount of the deposits in Irish joint-stock banks was £163,509,000, in Post Office Savings Bank £13,600,000, and in trustee savings banks £3,353,000. By Dec. 31 1920 the amount in joint-stock banks had increased to £182,682,000 and in trustee savings banks to £3,414,000.

The following figures for 1919–20 provide an estimate of the national wealth:—valuation of lands, houses, etc., £16,144,000; value of principal crops, £93,609,000; value of cattle, etc., £85,617,000; paid-up capital and reserve funds of joint-stock banks, £11,547,000; bank deposits £179,868,000; investments in Government stock, £95,063,000; paid-up capital, etc., of railway companies, £44,240,055; paid-up capital of tramway companies, £4,195,000.

The net produce of the income-tax in Ireland in 1919–20 was £5,926,643. (F. C. Mo.)

## POLITICAL HISTORY

The year 1910 marked the opening of a new phase in the history of Ireland. Irish political agitation in the past had lost its strength in proportion to the removal of economic grievances. The truth of this was illustrated by the effects of the Fair Rent Act of 1881, and once again by those of the Wyndham Purchase Act of 1903. In the six years between 1903 and 1909 some 217,000 tenants agreed to become purchasers of their holdings on terms advantageous to them and satisfactory to the owners, and during this period Ireland was apparently prosperous and contented. Had land purchase continued without interruption it is possible that the contentment would have continued also. Unfortunately in 1909 it became insistently apparent that the financial basis of the Act had broken down. The Act provided that the cash payable to the owner was to be provided by the issue of a sufficient amount of 2¾% stock, and that, if owing to the stock being at a discount, it became necessary to issue stock in excess of the nominal purchase money, the dividends on the excess stock should be met by the Guarantee Fund, meaning, in the result, the ratepayers in the Irish counties. In 1909 it became clear that the charge for necessary excess stock would bankrupt the county ratepayers, and the Government was compelled to take further action. Accordingly, Mr. Birrell by the Act of 1909 provided that the general taxpayer of the United Kingdom should take over, in relief of the Irish ratepayer, the liability already incurred for excess stock, and that as regards future purchase agreements vendors should be paid in 3% stock of the face value of the purchase money. Unfortunately, this 3% stock immediately fell below par and continued to fall in later years. Owners would not accept their purchase money in depreciated stock, and land purchase practically came to a standstill, while at least one-third of the country remained unsold.

***Agrarian and Labour Problems.***

It is possible, of course, to exaggerate the social effects of the complete carrying through of the land-purchase policy. It is true that under the Land Acts, and as a result of the Government's housing schemes, the lot of the Irish peasant improved immeasurably; that seemly cottages to a large extent replaced the thatched hovels of an earlier day; and that the occupiers who purchased, paying small annual instalments of purchase money fixed before the outbreak of the World War in 1914, earned subsequently disproportionate profits. But though the old Irish agrarian problem arising out of the landlord system had, since the passing of the Wyndham Act, been largely solved, there grew up in later years another problem due to the rapid increase of the class of "landless men," the sons of the prolific race of small farmers, a problem greatly accentuated by the stoppage of emigration during the war. The lot of the Irish labourers had become worse; for they had now to deal with a generation of close-fisted peasant proprietors in place of the easy-going squires of the old order.

Alongside of these agricultural labourers were the labourers of the towns. Outside Belfast and a few smaller northern

towns there are few manufactures in Ireland and little employment in the towns save in transport services, wages being low and unemployment chronic. This want of manufactures and employment has, rightly or wrongly, been attributed in Ireland to the selfish trade policy of England, and it is easy to see how the revolutionary elements fostered by the distress in the cities gained a host of recruits throughout the country.[1]

Another and even more fateful influence which began to operate in 1910—the reopening of the Home Rule question—was due to the result of the general elections, which by leaving the Unionist and Liberal parties almost equally balanced in the House of Commons made it clear that the Irish Nationalists, under the leadership of Mr. John Redmond, would hold the scales of power at Westminster. Thus Home Rule, kept in the background by the Liberal Government so long as it commanded an unchallenged parliamentary majority, became once more a main plank in the Liberal platform. The immediate effect was to revive the prestige of the Nationalist party, which had suffered some eclipse during the dull years of comparative contentment, and to give fresh impulse to the political agitation in Ireland.

*Home Rule Question, 1910.*

The nature and goal of this agitation were little understood outside Ireland; and, indeed, from the first the issues were obscured by dissensions among the Nationalists themselves. Some years earlier Mr. William Martin Murphy, a leading employer in Dublin, had founded the *Irish Independent* in opposition to the official Nationalist organ, the *Freeman's Journal*. It was largely under his influence that, on the eve of the general election, the unity of the Nationalist party was broken by the secession of Mr. William O'Brien, who accused Mr. Redmond and Mr. John Dillon of "blocking land purchase" and of having sold the Irish vote to the Liberal party, an accusation which was to be repeated later, with fatal force, by the Sinn Feiners.[2]

In the results of the elections in Ireland the effects of the Liberal-Nationalist alliance were significantly apparent: 11 "Independent Nationalists" were returned, among them being Mr. Tim Healy (N. Louth), and in the Protestant north, once the stronghold of Radicalism, only one Liberal, Mr. Redmond Barry, held his seat—in the predominantly Catholic constituency of North Tyrone. Ulster—or, rather, the solid Protestant block of the "six counties"—stood revealed as unalterably opposed to Nationalism. And behind the forces thus arrayed for the coming struggle there remained, sinister and menacing, the great political organizations which Ireland inherited from her troubled past—in Ulster the Orangemen, fiercely Protestant in spirit, who formed the backbone of the Unionist resistance; behind the Nationalists, the United Irish League and the Ancient Order of Hibernians, the latter exclusively Catholic and strong in its affiliation with the same order in the United States; and, last but not least, the Irish Republican Brotherhood, contemptuous of party alliance and constitutional methods.

*General Election, 1910.*

Thus, while Home Rule was being debated in England as a mere problem in local self-government, in Ireland the revival of the question emphasized once more the cleavage in the nation, Protestant and Catholic standing ranged against each other, as they had stood since the 16th century, marking "the contrast not only of two creeds, but of two breeds, of two ways of thinking, of two ways of looking at all the most vital interests of men."[3] English politicians were proposing to legislate, in the spirit of the 20th century, for a country which industrially was "just early 19th century" and "in religious matters had not yet emerged from the 17th"; for in 1910, and later, it was still true that "religion is the touchstone by which every Irishman is tested,"[4] and that creed marked the line of cleavage in everything that made for national sentiment. This is the fundamental fact which must be grasped, if the root cause of subsequent troubles is to be understood.

*Religious Cleavage.*

There were in 1910, however, other organized forces at work in Ireland, destined to cut across the traditional lines of political and religious cleavage. At this time the labour movement became organized with the foundation of the Irish Transport and General Workers' Union, under the leadership of James Larkin, a fiery demagogue, and James Connolly, who had founded the Irish Socialist Republican party in 1896, and who returned from America in 1910 inspired with a burning resentment at the conditions of life to which Irish working people were too often subjected. This Labour movement, of which the centre was established at Liberty Hall in Dublin, also threw itself into opposition to the official Nationalists, its spokesmen pointing out that influential Nationalist members of the Dublin corporation were responsible for the condition of the city slums by which they profited, and that from the point of view of labour there was nothing to choose between the dominant political parties. Equally opposed to the official Nationalists was another organization, which included among its objects the general improvement of social and industrial conditions in Ireland—the association known as Sinn Fein ("we ourselves"). Sinn Fein was quiescent during the elections, but was none the less active behind the scenes. Its more prominent members, who were recruited mainly from the ranks of the young "intellectuals," scorned the opportunist policy of the official Nationalists; gloried in upholding the tradition of Wolfe Tone and Robert Emmet; and openly aimed at establishing an independent Irish Republic.[5] In 1910 indeed they still advocated none but peaceful methods; but they were already planning the application of the policy advocated by their leader, Mr. Arthur Griffith,[6] namely that of using against "British rule" in Ireland the methods which had been successfully employed by the Magyars against Austrian rule in Hungary; and in their annual congress, held Sept. 29, they proposed making fresh efforts for the withdrawal of the Irish members from Parliament. Their ardent nationalism, based on a somewhat reckless idealization of Ireland's past,[7] present and future, was already a force to be

*Labour Movement.*

*Sinn Fein.*

[1] Very large numbers of the agricultural labourers were affiliated to the Irish Transport and General Workers' Union, the headquarters of which in Dublin, Liberty Hall, became the centre of the communist movement in the British Isles, and thus introduced a new factor in Irish political disturbances.

[2] In the *Cork Accent*, the first number of which appeared on Jan. 1 1910, Mr. O'Brien thus stated his mission:—"Ireland is passing through a grave crisis. She is being plundered by the Radical Government (a reference to the Finance Act) and gagged by the 'Molly Maguires' (the Ancient Order of Hibernians). The present Government has carried out Mr. Dillon's wishes, and killed land purchase in Ireland, thus robbing the country of the fruits of thirty years' agitation. It was only a knave would make, or a fool believe, the assertion that Home Rule was to be passed when the Lords' Veto was abolished. Under the rule of the 'Molly Maguires' no Protestant could be admitted into the National movement, be a member of a public board or a public contractor, obtain a position in the gift of a public body, or even get the Catholics' custom in his shop; and that section would either be starved out of existence or out of the country."

On Feb. 11 1910 a public meeting was held at Cork, under the presidency of the Lord Mayor, for the purpose of founding a new Independent Nationalist daily newspaper—the *Cork Free Press*. On this occasion Mr. O'Brien stated that at the elections the candidates "opposed to the despotism of the 'Molly Maguires' had received 45,547 votes, while the candidates of the 'Molly Maguires' only polled 44,865 votes put together."

[5] The Sinn Fein group had originally favoured Irish independence under the Crown, *i.e.* the Constitution of 1783. Republicanism was first openly professed by their organ *Irish Freedom* in 1910.

[6] In "The Regeneration of Hungary" (1904), which originally appeared as a series of articles in the *United Irishman*.

[7] Most national movements have sought inspiration in the belief in a golden age of national civilization, real or imaginary, in the past. It is certainly true of the Irish question that nobody can understand it who does not realize the immense part played in Ireland by historical tradition, true and false. As for the legend of the golden age of Irish civilization destroyed by the English invaders, the truth of this may be tested by readers of the *E. B.* by reading the article IRELAND: *Early History* (14,756) by the late E. C. Quiggin, an eminent Celtic scholar who wrote in a spirit wholly detached and scientific. This may be compared with the article BREHON LAWS by Mr. Lawrence Ginnell, the Nationalist M.P.

reckoned with, though the politicians continued to ignore it; for it appealed to many of the better elements in the country, less owing to its defiance of "British tyranny," than to its revolt against the dubious methods of the Irish Nationalist organization, with its local "bosses" and rings and its reliance on the support of the publicans and "gombeen men."[1]

Less popular in its appeal, but none the less of considerable political significance, was the enthusiasm of the Sinn Feiners for the revival of the Irish (Gaelic) language and a specifically Irish learning and culture. The Gaelic League, founded in 1893 for the promotion of these objects, was not indeed as yet identified with the Sinn Fein separatist movement; but an important step seemed to have been taken towards the realization of the Sinn Fein ideal when, in Sept. 1910, the Senate of the new National University decided that a knowledge of Gaelic should be required of all candidates for matriculation from 1913 onward.[2]

Meanwhile, on the surface of Irish history during 1910 the most conspicuous happenings were connected with the renewed land agitation, the battle of the factions within the Nationalist ranks, and the marshalling of the forces for and against the Union in view of the imminence of a Home Rule bill. The policy of violence for securing the distribution of the land had been deliberately reaffirmed by the United Irish League on Nov. 28 1909, two days after the passing of the Land Act; and since, in pursuit of its policy of conciliation, the Liberal Government had repealed the Arms Act, suspended all "coercive" legislation, and reduced the forces of the Constabulary, it proved quite incapable of coping with an organized campaign of outrage. At the meeting of the League in Dublin, Mr. Denis Johnston, a member of the Directory, said that "the people should make up their minds to put a ring of fire round every land-grabber and grazier in the country[3] and tell them to quit," and under the auspices of the League, throughout the year, cases of boycotting, cattle "driving," cattle maiming, firing into dwelling houses, and the like, continued in various counties. The conditions in this respect were not so bad as in the days of the Land League; but they were bad enough, and they had less excuse.

*Land Agitation.*

Meanwhile the struggle between the rival Nationalist factions was a bitter one, and rioting took place between the champions of Mr. O'Brien and Mr. Redmond.[4] In such circumstances the declared policy of the new "All-for-Ireland League," started by Mr. William O'Brien in Cork City on March 31, seemed like irony. It aimed at "a combination of all the elements of the Irish population in a spirit of mutual tolerance and patriotic good-will," at "guaranteeing the rights of the Protestants, winning the friendship of the British people, and disarming the prejudices of Irish Unionists against Home Rule." It was significant of later developments that, in putting forward this programme, Mr. O'Brien had the support of many well-known Irish Constitutionalists, as well as of many Nationalists.[5]

*Nationalist Parties and Home Rule.*

In general, however, Irish Unionists were less impressed by Mr. O'Brien's conciliatory rhetoric than by the fact that the Redmondite party had been carried to victory on the cry of "Up the Mollies!"[6] The Robert Emmet celebration early in March, conducted simultaneously in New York and Dublin, seemed to emphasize the true aim of the Nationalist movement. In New York aid was invited for the members of Parliament who were "working for independence through legislation."[7] In Dublin a republican orator, Mr. Bulmer Hobson, declared that "they had not in readiness any means to knock down an English dreadnought, but the Germans might do it for them."[8] The impression made by these demonstrations was strengthened as a result of the visit of Irish leaders to America in the autumn, for the purpose of collecting campaign funds. Messrs. Redmond, Devlin and Boyle left Ireland on Sept. 18 for the United States, while Mr. T. P. O'Connor went on a similar mission to Canada. Unionists duly noted the following passage from a speech delivered by Mr. Redmond at the Buffalo Convention:—

> Without freedom, all these great concessions (Land Acts, etc.) are practically valueless, or at any rate such value as they do possess is to be found in the fact that they strengthen the aim of the Irish people to push on to the great goal of national independence. . . . I have come here to-day to America to ask you to give us your aid in a supreme and, I believe, a final effort to dethrone once and for all the English Government of our country.[9]

In spite of this apparently unequivocal utterance Mr. Redmond was loudly accused in Ireland, notably by the Sinn Feiners, of "lowering the flag," a charge which, after his triumphant return on Nov. 12 with a fund of $200,000, he proceeded to rebut. Thus at Tipperary on the 13th he referred to the "ridiculous rumour" that he had lowered the flag, and at Waterford, on the 27th, he defined his demands for Ireland as a Parliament elected by the Irish people, with an executive responsible to it, and with full control of purely Irish affairs. This definition of "independence" only increased the wrath of the extremists, while Unionists failed to be convinced by his asseveration that under Home Rule there would be no "persecution of Protestants." In Dublin, on Nov. 26, a great meeting of Irish Unionists recorded their unalterable opposition to Home Rule in any form; and two days later, another great meeting at Belfast uttered a more ominous note, the threat being uttered that no taxes would be paid to a Home Rule Parliament, and that any attempt to enforce Nationalist Government on Ulster might meet with armed resistance. Thus the year 1910 ended with the first rumblings of the storm to come. A minor event of this year, which attracted no notice in England but embittered feeling in Ireland, was the decision of the Cunard Co., with the consent of Government, to omit the call at Queenstown of their great trans-atlantic liners. This was due to the exigencies of competition with the rival foreign lines, but was widely assumed in Ireland to be a fresh example of the deliberate policy of Great Britain to depress Irish commercial interests.[10]

The year 1911 was, on the whole, uneventful in Ireland. Agrarian unrest continued, with sporadic cases of cattle-driving, boycotting, shooting and bomb outrages, and incendiarism; and in many cases, owing to intimidation of witnesses, the Crown was unable to bring the perpetrators to justice.[11] At Wexford, in Jan., a demonstration of the Gaelic Athletic Association was held, under the presidency of the mayor, at which the Associa-

[1] Paul-Dubois, in his *Contemporary Ireland* (1908), called attention to the good effects of the bill of 1898, which set up in Ireland the British system of democratic local government. He added, however, "Even at the present there is a tendency to 'corner' offices and even contracts for members of this or that political league; the custom of *combinazione* is widely diffused; everybody is on the scent for places for his friends and relatives; and the reign of rings and bosses seems to be opening."

[2] For statistics of the rapid decay of Gaelic from 1851 onward *see* 5.616. The efforts to revive it have not met with any wide popular response; which is the less surprising as modern literary Gaelic is largely an artificial language unintelligible to the Irish who still speak the dialects of Connaught, Munster and Ulster.

[3] Ireland is preëminently a grazing country. The uncertain climate is unfavourable to the growth of corn, and the soil which produces magnificent pasture is often too rich for cereal crops.

[4] At Kilcommon, near Ballimore, on March 21, the fighting between the factions was so severe—even revolver shots being exchanged—that the Constabulary had to interfere. At Dundalk, on Sept. 8, a Redmondite mob invaded the town hall, where Mr. T. M. Healy was addressing his constituents, and pelted the platform with iron bolts and stones.

[5] A letter from the Earl of Dunraven, approving the movement, was read at the inaugural meeting.

[6] Mr. William O'Brien explained this as meaning "boycott of Protestants." In Ireland "Unionist" and "Protestant" are, or were, practically synonymous terms, though many better-class Catholics are Unionists and some Protestants Nationalists.

[10] This and the natural competition of Liverpool are the sole foundation for the charge made in the report of the American delegates to the Foreign Relations Committee of the Senate that "England allows no ship to come trans-Atlantic to her ports" (66th Congress, 1st Session, Senate Document 106, p. 828).

[11] See, *e.g.*, the charge of Judge Madden to the Grand Jury of Galway. (*Freeman's Journal*, March 2 1911.)

tion was definitely advertised as a rebel organization.[1] Demonstrations were also organized against the celebrations connected with the coronation of King George V. On Coronation Day (June 22) a meeting at the Custom House in Dublin was addressed by John Devoy, Countess Markievicz and others, in terms of violent denunciation, and the preparations made for the reception of the King and Queen in Dublin were met by a formal protest on the part of the Ancient Order of Hibernians, which declined "to identify itself with the wretched compromise sought to be effected by the misguided section of our fellow-countrymen who seek to sacrifice the great national principle of Ireland as a nation by the slavish adulation of a foreign monarch."[2] This protest was reëchoed in a resolution passed by a meeting of Sinn Fein;[3] but the royal visit to Dublin (July 7–11) was none the less a great success. Mr. Redmond, speaking at Woodford in Essex, had indeed emphasized the loyalty of the Nationalists to the Crown and Empire, and had been duly denounced by *Irish Freedom*, a Sinn Fein monthly, for betraying Irish Nationalism in "an orgy of Imperialism."

In view of this confusion of voices in the South it is perhaps not surprising that the mood of the Protestant North tended to harden; and this mood was at the moment still further embittered by attempts on the part of certain of the Catholic clergy to enforce the logical consequences of the *Ne temere* decree[4] in the case of "mixed marriages" already contracted. The annual July celebrations[5] in Ulster passed off quietly, and a great meeting on Aug. 12 at Londonderry did no more than emphasize the *moral* of the successful defence of the city as applied to the present perils. On the 21st, however, a meeting of Presbyterians was held in the same city, in which a stronger note of defiance was sounded, one clergyman declaring that a Home Rule bill forced through the House of Lords would be resisted by force.[6] This defiant temper was illustrated more especially by the great Unionist demonstration at Craigavon, Belfast, on Sept. 23, at which a hundred thousand people were present. In an impassioned speech Sir Edward Carson protested against the "base betrayal" of the Irish loyalists contemplated by the Liberal Government. "Never," he said, "under any circumstances, would they submit to Home Rule."[7] At the same meeting an address was presented, signed by a thousand Ulster business men, pointing out the disastrous effects to Ulster industry of any separation from Great Britain; and on the following Monday, as a result of the mandate given by the great mass meeting, a conference at Belfast of delegates from Orange Lodges, Unionist Clubs and the Ulster Unionist Council, resolved to frame a constitution for Ulster and to set up a provisional Government, should the Home Rule bill become law.

*Attitude of the North, 1911.*

The imminence of the introduction of the new Government of Ireland bill increased the agitation at the opening of 1912, and especially in the north of Ireland. On Jan. 5 a meeting of Southern Unionists at Omagh, in Tyrone, was addressed by Sir Edward Carson, who defended his attitude as leader of the Ulster resistance. He was, he said, a rebel in the sense that he desired to remain under the king and the Imperial Parliament and was prepared to face a charge on that issue. On the 16th the Ulster Unionist Council decided not to allow Mr. Winston Churchill to address a meeting in the Ulster Hall, Belfast, in favour of Home Rule. The meeting, however, took place on Feb. 8 on ground belonging to a Nationalist football club, and passed off without disaster, Mr. Churchill explaining "that any plan for Home Rule put forward would be an integral part of parliamentary devolution, and would not be inconsistent with the design of the ultimate federation of the Empire." The realities of the situation were, however, more clearly revealed by the great demonstration of Unionists held on Easter Tuesday at Balmoral, Belfast, and presided over by Dr. Crozier, the Protestant Primate of All Ireland. From the temper of this assembly it was clear that, as Mr. Bonar Law put it, "Ireland is not a nation, but two peoples separated by a deeper gulf than that dividing Ireland from Great Britain."

*Ulster and the Home Rule Bill.*

The same moral was drawn by Sir Edward Carson in his speech during the debate on the introduction of the Home Rule bill on April 11. The dividing line in Ireland, he said, was between Catholic and Protestant, and any argument for Home Rule for Ireland applied with equal force to Home Rule for the Protestant North. Mr. Asquith, on the other hand, declared it to be "impossible to concede the demand of a small minority to veto the verdict of the Irish nation"; but in the adjourned debate on the 15th Mr. Balfour exposed this fallacy. The United Kingdom, he said, should be treated as a whole: "If Ireland is a nation, what right has Great Britain to supremacy?"

The debates on the bill in the House and in the country showed, indeed, an extraordinary confusion of mind in British legislators as to the Irish demand. There was talk of devolution as a step towards federalization, of "local autonomy" and of the necessity of delegating the work of the over-burdened Imperial Parliament. But the Irish Nationalists, whatever concessions they were prepared to yield to expediency, never budged from their principle of "Ireland a nation," with all that this implied. This ideal the bill did little enough to realize. It proposed to establish in Dublin a subordinate Parliament, consisting of two Chambers, and having control over all concerns in Ireland not specifically reserved to the Imperial Parliament; but the number of matters thus reserved, either temporarily or permanently, was very great,[8] while the difficulty, so long as any union existed, of disentangling the finance of the two countries opened the financial clauses of the bill to a destructive fire of criticism; for, as Sir Edward Carson had said at Liverpool (Jan. 23), without fiscal autonomy Home Rule was an impossibility.

*Parliament and the Irish Question.*

In Ireland, the bill was endorsed by the Nationalist Convention which met in Dublin on April 23, but Mr. O'Brien pointed out in the House of Commons in the course of the second reading debate on April 30, that, save for the reconciliation it would bring, there was no finality about it. This, indeed, was the opinion of most people in Ireland, in spite of demonstrations to the contrary; and Prof. T. M. Kettle, of the National University, expressed the general view of Nationalists when he welcomed it as "not the end, but the beginning," and said that it had "the seed of freedom lodged in Irish soil."[9] Sinn Fein was less complimentary. According to Patrick H. Pearse, who was afterwards to head the Easter rebellion in 1916, Mr. Redmond by accepting the bill had "sold Ireland's birthright for a mess of pottage, and a dubious mess of pottage at that." He himself defined the object of true Nationalism as the completion of the work left unfinished by Wolfe Tone:—

*Nationalists and the Bill.*

"To break the connexion with England, the never-failing source of all our political evils, and to assist the independence of my country—these were my objects. To unite the whole people of Ireland, to abolish the memory of all past dissensions, and to substitute the common name of Irishman in place of the denominations of Protestant, Catholic and Dissenter—these were my means."

In these words of Tone he found "implicit all the philosophy of Irish Nationalism, all the teaching of the Gaelic League and the later prophets."[10] It was the Sinn Fein confession of faith.

[1] Mr. Daniel McCarthy said: "It is an organization to keep the bone and muscle of our country from donning the red coat or the black coat of England (*i.e.* from enlisting in the army or the Royal Irish Constabulary) . . . We want our men to be physically strong, and when the time comes the hurlers will cast away the caman for the sharp, bright steel that will drive the Saxon from our land." *Wicklow People*, Jan. 21 1911.

Unionists, on the other hand, whose danger had been fully recognized by Mr. O'Brien, failed to be won over by the inadequate safeguards provided for them in the bill. The Synod of the Church of Ireland, with only five dissentients, protested against it, and the protest was reëchoed in a great meeting of Southern Unionists at Cork on April 20. In Ireland, at least, no one was convinced by Mr. Redmond's assertion, during the second reading debate, that the bill would be accepted by the Irish, in Ireland and out of it, as a final settlement.

*Question of "Partition."*

The debate on the committee stage of the bill, which opened on June 11, is mainly memorable owing to the fact that in it the question of the exclusion of Ulster was first definitely raised, the proposal being to exclude from the scope of the bill the four predominantly Protestant counties of Antrim, Armagh, Down and Londonderry. The motion was defeated, Mr. Asquith asserting that it was impossible to split Ireland, for which he claimed "a fundamental unity of race, temperament and tradition," while Mr. Redmond said that Home Rule was put forward as a national demand and that the Irish nation must not be partitioned. There was, however, little sign in Ireland of the correctness of Mr. Birrell's forecast that there would be no civil war and that the minority would accept the situation. The temper of the Protestant North was rapidly rising, and fortified by Mr. Bonar Law's declaration at the meeting at Blenheim on July 27—that he could imagine no length of resistance to which the Ulster people might go in which he would not be ready to support them—the northern Protestants organized numerous demonstrations against Home Rule, culminating on "Ulster Day" (Sept. 28) in the signing at Belfast of the solemn Covenant pledging the signatories to stand by one another in defending for themselves and their children their cherished position of equal citizenship in the United Kingdom, and in using all means which might be found necessary to defeat the conspiracy to set up a Home Rule Parliament in Ireland.

*The Ulster Covenant.*

The impression made by this event was immense. The proceedings were attended by a vast concourse of people, and a deep religious significance was given to them by the fact that in some 500 Protestant churches of various denominations special services were held on the same day, with appropriate hymns and lessons, and closing with the National Anthem. The impression made by it was not lessened when, on Nov. 22, it was announced that the Covenant had been signed by half a million people.

*Religious Antagonisms.*

Apart from a certain number of agrarian outrages, there were during this year ominous signs that the old religious antagonisms, which had all but died down, were beginning to revive. On June 29 members of the Ancient Order of Hibernians, armed with pikes, attacked a Belfast Presbyterian Sunday School procession consisting mainly of women and children,[1] and the Protestant shipyard workers of Belfast retaliated by an assault on their Catholic fellow-workmen. On Sept. 14 a serious political riot broke out on the Celtic football ground in Belfast, in which 100 people were injured.

While the Home Rule bill, twice thrown out by the House of Lords, was making its painful way through Parliament, the realities of the situation in Ireland itself were becoming more and more apparent. Mr. Birrell was right when he said in the House of Commons that "a new movement and a new spirit were springing up in Ireland—a national movement, full of Irish sentiment." He went much too far, or not nearly far enough, when he described the Ulster opposition to this movement as "based on religious bigotry." It was based on the broad conviction that in any Irish National Parliament the religious and material interests of the Protestants and industrial North would be sacrificed to those of the Catholic and agricultural South. Their attitude was not modified by such "safeguards" as Mr. Asquith and Mr. Redmond were prepared to offer, *e.g.* disproportionate representation in the Irish Parliament, which they rejected as undemocratic and fallacious, since it would still leave them in the minority; and Mr. Asquith's refusal to meet their views they interpreted as a "declaration of war." During 1913, accordingly, the organization of resistance in Ulster proceeded apace, and by the autumn it was complete. On Sept. 25 the Ulster Unionist Council formally organized itself as a Provisional Government consisting of a central authority of 76 members, under the chairmanship of Sir Edward Carson; with committees for the volunteers, legal subjects, education and Customs, excise and posts; and on the following day Sir Edward Carson began a tour of inspection of the volunteers in various centres, the whole force—estimated at 100,000—being under the supreme command of Gen. Sir George Richardson.

*Ulster Organizes.*

In making these warlike preparations the Ulster leaders were careful to insist that they were actuated solely by the determination to maintain their traditional rights and liberties; they reaffirmed their complete loyalty to the Empire, and undertook to place the whole armed force of Ulster at its disposal in the event of its being attacked. But the arming of the North was bound to have an unfortunate repercussion in the South. The Sinn Fein organ *Irish Freedom*, Jan. 1913, pointed out that war between England and Germany was practically inevitable, and declared such a war to be "Ireland's opportunity"; and this was elaborated by Sir Roger Casement in an article on "Ireland, Germany and the next War," contributed to the July number of the same review.[2] On Jan. 23 the Sinn Fein National Council passed a resolution refusing to be content with anything short of independence, and affirming it to be the duty of all Irishmen to possess a knowledge of arms.[3] A vigorous anti-recruiting campaign was started, and every effort was made to pour contempt on the British army. "Rifles would hardly be needed, fly-paper would surely suffice to capture the greater part of the little 'Yorks' and 'Berks,'" wrote a popular Nationalist paper. "By the way, we have pigs of these breeds in Tipperary already. Poor kiddies, poor little boy soldiers! How will they withstand the onrush of conquering German uhlans some day?"[4] Meanwhile the arming of Ulster was hailed among Sinn Feiners as a practical step worthy of imitation.

*Sinn Fein Looks to Germany.*

On the initiative of a provisional committee, consisting of members of the Sinn Fein League, the Gaelic Athletic Association, the Gaelic League and the Irish Republican Brotherhood, a mass meeting was held on Nov. 25 in the Rotunda Rink in Dublin, under the presidency of Prof. John MacNeill of the National University, to inaugurate the National Volunteers. It was noted that the Ancient Order of Hibernians and the United Irish League, which were attached to Mr. Redmond's party, were not officially represented at the meeting, though many of their members were present. The Transport Workers' Union, on the other hand, sent a contingent with bands. As the immediate result of the meeting 4,000 men were enrolled, and on the following day a committee was established for their drilling and organization. The object of the volunteers, as defined in the form of application for membership, was "to secure and maintain the rights and liberties common to all the people of Ireland without distinction of class, creed or politics."

*The National Volunteers.*

A new and more dangerous element was added to this welter by the strike of transport workers which began in Dublin in August. The conditions of life to which labour in Dublin was subjected were described in the report of the Local Government Board Commission on the strike as "the worst in Europe";[5] and at first public sympathy was largely enlisted on the side of the strikers. But this sympathy was soon alienated by the violence of Larkin's

language and actions. On Aug. 26 he was arrested, but released on bail. On the 30th the mob in Sackville Street furiously attacked the Dublin Metropolitan police, who quickly quelled the riot. On the 31st Larkin reached the balcony of a hotel in Sackville Street in disguise, delivered a violent harangue to the mob, and this produced another riot. Delegates of the English trade unions were called in to assist at arriving at a settlement; but on Sept. 13 the employers, in view of the fact that "Larkinism" included in its programme a repudiation of the obligation to keep inconvenient agreements, refused to resume negotiations and decided on a sympathetic lock-out. This threw out of work several thousand men who refused to sign a pledge not to join or to assist the Transport Workers' Union. On the 21st there was another serious conflict with the police, and the unemployed next day were estimated to number 13,000. The strike spread sporadically to England, owing to the refusal of English workers to handle "tainted goods"; but Larkin's violent attitude during a propaganda tour in England alienated the still predominantly sober elements in the British movement, and the strike collapsed early in 1914. There was nothing Nationalist about it; at the Board of Trade inquiry Larkin had exposed the failure of the Nationalist members to assist the cause of the workers, and he denounced Redmond and Carson as "in league with capitalism"; the arch strike-breaker, William Martin Murphy, on whom the hatred of the proletariat was concentrated, was owner and inspirer of the Nationalist *Independent*. The strike failed, but its consequences were momentous. Liberty Hall became definitely the centre of that spirit which was to be known later as Bolshevist. Moreover, during the late autumn, Larkin had begun drilling and organizing that "Citizen Army"—a body distinct from the Irish Volunteers—which was to play the leading part in the Easter rebellion.[1]

The situation in Ireland was now very alarming, and competent judges, such as Sir Henry Blake and Earl Grey, pointed out the imminent danger of civil war were the Government policy persisted in. Liberal statesmen began to talk of compromise, Sir Edward Grey, for instance, affirming at Berwick (Oct. 17) and again at Alnwick (Dec. 17) that "Home Rule within Home Rule" for Ulster was quite consistent with the maintenance of the essential unity of Ireland. On Dec. 6 Mr. Asquith, at Manchester, said that he saw nothing with which he would quarrel in principle in the bases of settlement laid down by Sir Edward Carson at Sheffield four days earlier, namely, "that it must not humiliate Ulstermen, that they must not be treated differently to other parts of the United Kingdom, and that there must be no measure establishing a basis for the ultimate separation of Ireland from Great Britain." On Nov. 14, at Newcastle-on-Tyne, however, Mr. Redmond had violently attacked the claim of a small minority in Ireland to dictate to the rest. It would be worth paying a large price, he said, to obtain a settlement by consent, but the door of the Empire must not be slammed in the face of Ireland by the fear of fanatics or by the bludgeons of bullies.

*Attempts to Compromise the Ulster Question.*

The opinion of the Protestant North against Home Rule was hardened—if that were possible—by the continued activities of the United Irish League and the Hibernians during 1913. Boycotting was again in operation as a political weapon, the most notable instance being the boycott proclaimed (Nov. 29) against 29 Sligo merchants who had signed a pronouncement criticizing the financial provisions of the Home Rule bill and declaring that it would be fatal to the commercial interests of Ireland. Point was given to the boycotting resolution by the statement that it was a "united protest against the conduct of a number of local *Protestant* merchants."[2] On the other hand, at a great demonstration to celebrate the 225th anniversary of the relief of Derry, held on Dec. 18, Dr. D'Arcy, Protestant Bishop of Down and later (1920) Primate of All Ireland, while affirming that Protestants bore "no ill-will to any dwellers in this land" and were "patriotic Irishmen," reaffirmed the Covenant as "the inevitable outcome of the heart and mind of Ulster."[3]

*The Boycott as a Political Weapon.*

In the face of this dangerous situation the Irish Government appeared to regard itself as impotent. It would not be true to say that the arming of Ulster had been connived at: for more than one considerable seizure of arms was made.[4] It was not, however, until Dec. that a proclamation was issued prohibiting the importation of arms altogether; and from the first, in view of the appeal of the Arms Act, its legality was disputed.[5] At the opening of 1914 serious efforts were made to arrive at a compromise; but the conference of the Liberal and Nationalist leaders with Sir Edward Carson and Mr. Bonar Law only resulted—to use Mr. Asquith's words—in "bringing out the difficulties." In these circumstances the Prime Minister on the second reading of the bill (March 9), proposed a "middle course," *i.e.* the provisional exclusion of Ulster for six years by county option, the excluded counties to come automatically under the Dublin Government at the end of that time unless the Imperial Parliament decided otherwise. This proposal Mr. Redmond supported, but as "the ultimate limit of concession." Mr. O'Brien, on the other hand, protested against this plan for "chopping an ancient nation into a thing of shreds and patches," and he was supported by Mr. Tim Healy. More fatal, however, was the attitude of Sir Edward Carson. He would, he said, never consent to sacrifice the loyal people of the South and West, and the men of Ulster did not want "sentence of death with a stay of execution for six years." In the debate on Mr. Bonar Law's motion of censure on the Government (March 19) the tension reached breaking point. Mr. Redmond had earlier declared that if Ulster did not accept the compromise proposed, the bill must pass as it stood and be imposed on Ulster with all the forces of the Crown, and on Dec. 4 Sir Edward Grey, Minister for Foreign Affairs, had declared that a "fanatical outburst" in Ulster would have to be suppressed by force. The leader of the Opposition now declared that the attitude of the army would be for the army to decide, since while "in case of mere disorder it ought to and would obey, if it were a question of civil war soldiers were citizens like the rest of us." Sir Edward Carson, for his part, accused the Government of wanting an outbreak in Ulster as a pretext for putting the Ulstermen down. At the close of his speech he left the debate and, with eight of the Unionist leaders, started at once for Belfast to concert measure of resistance.

*The Arms Proclamation.*

*Temporary Exclusion of Ulster Suggested.*

So early as March 14, the Government had taken certain military precautions in case of "serious disorder" breaking out in Ulster, the general commanding in Ireland, Sir Arthur Paget, being instructed to convey a force of cavalry, infantry and artillery northward, ostensibly to protect military stores from possible depredations by the Volunteers. This movement was to be supported by a British squadron stationed at Lamlash, in Arran. Whatever truth there may have been in the belief that the Government intended to crush the resistance of Ulster by force—and this was strenuously denied—the result was to show that in any such policy they would not have the support of the army.[6] The troops were received in

[5] In Dublin 21,000 families were found to live in one-room tenements, of which 9,000 were occupied by four or more persons.

then set out on the road to Howth, and when the Volunteers on their return march neared Clontarf they found this force blocking both the main roads to Dublin.

A halt was called, and Mr. Harrel stepped forward to parley with the two leaders of the Volunteers. On their refusal to order their men to give up their rifles, he ordered the police to disarm them. In the short scuffle that followed the soldiers assisted the police; the Volunteers fought with clubbed rifles, and some of them received slight bayonet wounds. In the end 19 rifles and a number of wooden clubs or batons were captured; but the rear ranks of the Volunteers had taken advantage of the fight in front to disperse and carry off their rifles singly. After the road was clear two soldiers were wounded by revolver shots, fired, not by Volunteers, but by bystanders.[1]

*The Bachelors' Walk Massacre.*

The affair being now considered at an end, the troops were ordered to march back to Dublin. They consisted of 100 Scottish Borderers, under Capt. Cobden, who were joined near Fairview by about 60 men of the same regiment under Maj. Coke. Their route took them through a low quarter of the city, where they were followed by a crowd which, not content with hurling abusive epithets at them, presently began to pelt them with stones and other missiles. All down Talbot Street, Earl Street and Sackville Street, it had been possible to hold the mob in check by the rear-guard occasionally turning and threatening them with bayonets. But by the time the troops, marching along the quay of the Liffey called Bachelors' Walk, had reached the corner of Liffey Street, matters were so serious—25% of the men being badly hurt—that Maj. Haig, who had just arrived and taken command as senior officer, told off 30 men, who turned and lined the road, four or five of them kneeling. He asked five or six of them if they were loaded, and ordered them to be ready to fire if he gave the order. Immediately afterwards, owing to some misunderstanding, 21 of the men discharged their rifles, with the result that three persons were killed and 38 more or less seriously wounded. In the course of the inquiry into this unhappy affair Maj. Haig stated that he was not aware that the 100 men under Capt. Cobden had been ordered to load at Howth Road and were still loaded. A judicial commission decided that the soldiers were not justified in firing, but failed to come to any decision as to whether or not an order to fire had been given.[2]

This Bachelors' Walk "Massacre" was a serious embarrassment to the Liberal Government. Their efforts to make Mr. Harrel solely responsible, on the ground that he had disobeyed his instructions, broke down on the fact, revealed under cross-examination in Parliament, that these instructions had only been written four hours after the event. A Royal Commission, carefully selected, was more effective. Mr. Harrel was found to have exceeded his powers in calling out the military, and was dismissed from the force. The effect on the *moral* of the police was disastrous, for henceforward it was felt that no action could be taken by them, even in grave emergencies, without risk of being "broken" by the Government.[3] The effect on the *moral* of Sinn Fein is best explained in the words of Thomas MacDonagh:—

> The whole moral of this story, as of the whole rise and progress of the Irish Volunteers during the past eight months, is that if the leaders of the Irish people act strongly and decisively, they can succeed in their action. The young men of Ireland have got a strong lead from the Irish Volunteers; and they march to victory. Ireland has now the strength to enforce her choice of destiny. The men who ruled Ireland in the past under Tory régime, and under Liberal régime, lost their power on July 26. At Clontarf in 1914, as at Clontarf in 1014, has been won a national victory.[4]

Such was the situation in Ireland within a month of the crime of Sarajevo—two organized hostile forces standing face to face, both protesting their pacific intentions, both refusing to budge an inch from claims which made an agreed peace impossible.[5] Small wonder that to foreign observers the Bachelors' Walk affair seemed the beginning of troubles which would keep the British Government fully occupied at home.[6]

*Effect of the Declaration of War.*

The most surprising effect of the declaration of war against Germany on Aug. 4 1914, however, was that it seemed at once to unite all Ireland with the rest of the United Kingdom in a common cause. In the House of Commons Irish Unionists and both sections of Irish Nationalists gave their support to the Government. Mr. Redmond, in his speech on Aug. 5 in support of the vote of credit, declared that the events of recent years had completely changed the feeling of Nationalists towards Great Britain. The Government might safely withdraw all the troops from Ireland, for her coasts would be defended by her armed sons, and the National Volunteers would gladly join with their brethren of the North for this purpose. When Nationalists and Ulstermen had fought together on the Continent, and drilled together for home defence, he believed it would be possible, as regarded Home Rule, to present a real Amending Bill to the Government by agreement. Thus Ireland was committed to the World War by the united voice of her representatives. "Ireland," said Sir Edward Grey in his speech announcing to Parliament the declaration of war, "is the one bright spot."

*Passing of the Home Rule Bill 1914.*

It was almost at once apparent, however, that the old antagonisms, though obscured for the time, survived. Attempts to settle the Home Rule controversy by negotiation between the party leaders broke down; and on Sept. 14 it was announced that the Prime Minister intended to wind up the session at once, and that then the Home Rule bill would become law automatically under the Parliament Act, but that the Government would introduce a bill[7] postponing the operation of the Act till after the war and pledged itself to introduce an Amending bill dealing with Ulster before the Home Rule Act should become operative. In announcing this policy to the House of Commons Mr. Asquith said that the new bill would provide that the Act should not be put in operation for 12 months in

[1] This follows the official account (for further details see report of the Royal Commission, Cd. 7631 and 7649). In "Clontarf"—a supplement to the *Irish Review*, July–Aug. 1914—Thomas MacDonagh—afterwards executed as one of the leaders of the Easter rebellion—who was one of the Volunteer officers with whom Mr. Harrel talked, gives a somewhat different version. He does not mention any scuffle but says that the commissioner, after negotiation, allowed the Volunteers to keep their rifles on condition of their being at once dismissed. The force, he says, was thereupon marched into Fairview Park and formally dismissed. His account, while naturally magnifying the rôle played by the Volunteers, is moderate and restrained.

[2] In his evidence before the Foreign Relations Committee of the U.S. Senate (Aug. 30 1919) the Hon. W. Bourke Cockran thus summarized the Howth gun-running incident: "Gun-running promised to become a favourite sport of these chartered rebels, the Ulstermen—chartered by the very Government they were defying. But when the Nationalists undertook to bring in a cargo of arms the British soldiery appeared on the spot and with bullet and bayonet prevented them from landing a single rifle, shooting down women and children who happened to be spectators" (see 66th Congress, 1st Session, Senate Document No. 106, p. 893).

A recent German "historian" of Ireland succeeds in outdoing even Mr. Bourke Cockran. His succinct account of the Howth gun-running is as follows: "On July 26 1914, the Volunteers brilliantly underwent their baptism of fire; a yacht from Rouen had secretly landed arms and ammunition at Howth, and when the English garrison of Dublin tried to disarm the Volunteers, it was put to flight by them with the butt-ends of their rifles; whereupon, in anger at its defeat, it fired into the unarmed crowd, mostly consisting of women and children, and killed and wounded very many persons." Julius Pokorny, *Ireland* (Perthes' Kleine Völker- und Länder-Kunde, Band 1), Gotha 1916, p. 135.

[3] See Report of Royal Commission on the rebellion in Ireland (Cd. 8279), p. 6.

[4] "Clontarf," *loc. cit.* The writer omits to mention that, in spite of Brian Boru's victory at Clontarf, Dublin remained after it, just as before, a Danish city.

[5] The Ulster proclamations of a purely defensive attitude have already been noted. On June 30 the Irish Volunteers published a manifesto stating that they would "do their utmost to promote peace and good-will throughout Ireland," their object being "to secure the unity of all Ireland and of all Irishmen on the ground of national liberty."

[6] Baron Kühlmann cabled to Berlin "the hour has come."

[7] This bill also provided for a similar postponement of the Act disestablishing the Welsh Church.

any case, or, if the war was not then ended, before such further date, not later than the termination of the war, as might be fixed by Order in Council.

*Attitude of Ulster.*

This action of the Government in taking advantage of the "party truce" to place Home Rule upon the Statute Book, though it rallied the more moderate Nationalists to the common cause, was strongly resented by Unionists both in England and Ireland; and Mr. Bonar Law denounced it in the House of Commons as a breach of faith. His language was reëchoed by Sir Edward Carson in a manifesto to the Ulster loyalists, in which he reiterated the determination of Ulster never to submit to Home Rule, but at the same time urged his followers, in view of the peril to the Empire, to be true to their motto of "our country first." At a great meeting held on Sept. 28 to celebrate the second anniversary of Ulster Day he spoke in the same sense. On Sept. 16 the executive committee of the Irish Unionist Alliance, representing the Unionists of the three southern provinces, also passed a resolution condemning "the flagrant breach of faith by the Government," but at the same time added another pointing out "the duty of Irishmen to undertake their full share of Imperial responsibility in the present national emergency" and calling upon its members and supporters to continue their efforts to secure recruits for the army.

*Split in the National Volunteer Movement.*

It seemed of happy augury that on this same Sept. 16 Mr. Redmond also issued a manifesto calling on the people of Ireland to take their part in this great national crisis and asking that Irish recruits for the expeditionary force should be kept together in an Irish Brigade under Irish officers. The latter demand was endorsed by the Prime Minister, Mr. Asquith, at a great recruiting meeting held at the Dublin Mansion House on Sept. 25, at which Mr. Redmond again urged his countrymen to enlist. Meanwhile, however, though there had been no outward sign of disunion in the committee of the National Volunteers, it had from the first been clear that its Sinn Fein members were determined to resist recruiting in every way, and on the eve of the Mansion House meeting (Sept. 24) 20 members of the committee, headed by the chairman, Prof. MacNeill, issued a manifesto denouncing Mr. Redmond for consenting to "a dismemberment of Ireland" and accusing him of being willing to "risk another disruption" by announcing for the Irish Volunteers "a programme fundamentally at variance with their own published and accepted aims and pledges," viz. that it was their duty to take foreign service under a Government which was not Irish. In view of this attitude the signatories declared that the nominees of Mr. Redmond ceased to be members of the Provisional Committee, and they ended their pronouncement by reaffirming without qualification the manifesto proposed and adopted at the inaugural meeting, repudiating any undertaking for the partition of Ireland and declaring that Ireland could not, with honour or safety, take part in foreign quarrels otherwise than through the free action of a National Government of her own.[1] That this manifesto had a strong support among the Dublin Volunteers was shown on the following night, for while a few acted as sentinels at the Mansion House several thousand paraded in Sackville Street amid dense masses of spectators, in support of Prof. MacNeill. This was a declaration of war against the Nationalist party, and Mr. Redmond was prompt to take it up. He appealed, with striking success, to the provincial centres; and at a convention of Volunteers held in Dublin on Sept. 30 a new Provisional Committee was elected, with Mr. Redmond as president. The Sinn Fein leaders who had signed the manifesto of the 25th thereupon seceded and proceeded to organize a force of their own under the style of the Irish Volunteers.

This movement was not at the time regarded as serious. The spokesmen of Sinn Fein were men of no particular position or weight; and there was plentiful evidence that their gospel of hate made little appeal to the people at large, and that the interest of Ireland in the victory of the Empire was all but universally recognized. From Tyrone, for instance, the very storm centre of sectarian strife, the police had reported in June that "distrust and hatred between Catholic and Protestant had never been so deep" within their memory; a few weeks later they reported that, during the mobilization, Ulster and National Volunteers were turning out together with their bands to escort the troops leaving for the front. The same was true, in varying degrees, of all parts of the country: "the outbreak of war"—to quote the police reports—"worked a revolution in the state of party feeling." Here and there, as *e.g.* in Monaghan and Westmeath, agrarian trouble continued intermittently, but from Aug. 4 1914 to the end of 1915 the reports from every county in the four provinces agree that "there were practically no displays of party feeling." Ireland seemed at last united in a common effort directed to a common end. The union seemed to be symbolized by the support given to the National Volunteers by the prominent Unionists in the South and the occasional fraternization of the Ulster and National Volunteers in the North. To those who know Ireland and its deep-seated passions and antagonisms the mere list of the names of the notabilities who attended the great recruiting meeting at Warrenpoint in county Down (July 7 1915) reads like a miracle: there were present the Lord Lieutenant (the Marquess of Aberdeen), Mr. Justice Ross,[2] Mr. W. A. Redmond, the Lord Mayors of Dublin and Cork and the Mayor of Londonderry. It was characteristic of the spirit of this unique year in Irish history.

*Ireland and the War.*

Beneath the surface, however, the passions simmered, the antagonisms still glowed. The index to the true feelings of the people, the measure of their devotion, were the returns of the number of recruits to the army and to the various bodies of Volunteers. For the famous Irish regiments of the regular army recruiting was at first brisk, though even their cadres had to be filled up with English recruits who happened to be training in Ireland.[3] In the towns of Ulster recruiting was from the first fairly satisfactory, while—as was also the case in the South—the men of the countryside hung back. Of the Ulster Volunteers, numbering 85,000 in Aug. 1914, 20,700 had joined the army by the end of Dec., this number representing the mass of those who were at that time of military age. The returns of enlistments from the ranks of the National Volunteers were less satisfactory; but under the stimulus of the eloquence of the Nationalist leaders the situation in this respect was much improved later, the official returns showing that between Dec. 15 1914 and Dec. 15 1915, 10,794 joined the colours. It is clear, however, from these returns that there was never any question of either body of Volunteers joining the army *en masse*, and that the main source of recruits lay outside them. At the close of the year 1915 the Ulster Volunteers still numbered 56,000, while the number of National Volunteers, which had reached 178,649 in Oct. 1914, had only sunk to 152,090.

*Recruiting in Ireland.*

The unsatisfactory results of the recruiting campaign have been ascribed to a variety of causes.[4] Mr. Lloyd George himself blamed "the folly almost amounting to malignancy of the War Office," which had refused to entertain the idea of turning the National Volunteers into an Irish Army Corps and had rejected the offer of a group of loyal Irish ladies to work flags for the new regiments. But in judging the War Office for its refusal to consider the formation of a separate Irish Army Corps, two things have to be remembered. In the early and

[1] Published in the *Irish Volunteer*, Oct. 3 1914. Among the signatories were Patrick H. Pearse, Joseph Plunkett, Thomas MacDonagh, and other leaders of the 1916 rebellion. Regret was expressed that, owing to his absence in America, the signature of Sir Roger Casement was not attached.

[2] Sir John Ross, appointed Lord Chancellor of Ireland in July 1921.

[3] After the retreat from Mons the urgent need for replenishing infantry battalions led to the drafting of Irish recruits who had enlisted in the Irish cavalry into English line regiments. This was greatly resented.

[4] Much was due to defective organization. In many cases the ardour of would-be soldiers was damped when they found that they had to go 30 or 40 m. to the nearest recruiting station.

critical stages of the war mobile units were the great need, and regiments are more quickly made efficient than army corps, which—as the experience of the two Irish divisions was to prove—take a long time to organize and train.[1] Secondly, until the definite breach between the Sinn Feiners and the Redmondites in Oct. 1914, it was by no means certain that the National Volunteers were to be trusted, and even after the breach the police reported that a considerable proportion of the Redmondite volunteers were in sympathy with Prof. MacNeill. It might well have seemed too speculative an undertaking to train and arm "for the protection of the coasts of Ireland" (which were in little danger) a force which, under influences already at work, might be used for less innocent purposes.

*The Irish Volunteers*

It is, indeed, to these influences and to other causes which they exploited, rather than to any action or inaction of the War Office, that the refusal to enlist for the war on the part of large sections of the population must be ascribed. In setting up the organization of the Irish Volunteers, the Sinn Feiners did not succeed in obtaining any large nominal following, but they made up for their lack of numbers by their fanatical zeal, and the efficiency of their organization. Of all the volunteer forces in existence during 1915 the Irish Volunteers and their allies the Citizen Army alone displayed any activity in drilling and exercising, which they were allowed to do without let or hindrance, occasionally even enjoying the protection of the police.[2] Meanwhile their organizers and agitators were busy in those counties where the tradition of disaffection was strongest—Limerick, Kerry, Kilkenny, Waterford, Wexford and Galway. Their object, openly avowed, was to prevent recruiting for the army and to build up their own force with a view to taking immediate advantage of "Ireland's opportunity." They conjured up the bogey of "conscription" with notable effect, until the exclusion of Ireland from the Military Service Act laid this spectre to rest for the time being. Many National Volunteers ceased to attend drill because they feared that, if they drilled, they might be called upon to fight; and a certain number joined the Irish Volunteers as the best safeguard against conscription.[3] The Sinn Feiners were helped, too, by the immense prosperity of the country, which—what with separation allowances and the high prices of agricultural produce—had never been so full of money; for this disinclined the young men of the more prosperous classes to exchange present comforts for the miseries and dangers of the trenches. If, as the Sinn Feiners reiterated, this was solely "England's war," they had the most patriotic reasons for abstaining from it. On the whole the wonder is, not that Ireland did not provide more recruits, but that she provided so many.

*Progress of Sedition.*

Incredible as it may now seem, there was between Aug. 5 1914 and Dec. 5 1915 no law in force prohibiting the importation of arms into Ireland.[4] Certain warrants were, indeed, issued during this time to the police by the Lord Lieutenant, authorizing them to seize arms, but it was not until the amendment of the regulations under the Defence of the Realm Act, on Dec. 5, that they were empowered to seize arms and explosives landed on the coast.[5] In spite of these laws, arms and ammunition continued to be smuggled into the country. At the same time a flood of seditious literature began to be disseminated by the leaders of the Irish Volunteers. Its exuberance was to a certain extent tempered by the existence of the military censorship, but as this took notice only of matter which was judged to have military importance, articles merely abusing the British Government and army, or praising the gallantry and humanity of the Germans, gained for the ignorant public an enhanced authority by having been "passed by the censor." From time to time certain of the seditious papers, having exceeded all bounds, were suppressed (e.g. *Irish Freedom* and the *Irish Worker* in Dec. 1914), and others, after their printers had been warned by the authorities, ceased to appear (*Sinn Fein*, *Fianna Fail* and *Ireland*). But their place was taken by others no less violent[6]—*The Spark* (Feb. 7 1915), *The Workers' Republic* (May 30) edited by James Connolly, *The Hibernian* (June 24), *Nationality* (June 26), *Honesty* (Oct. 16), *The Irishman* (Jan. 15 1916) and *The Gael* (Jan. 29). The only one of them to reach any high standard of even journalistic excellence was *Nationality*, which, under the editorship of Mr. Arthur Griffith, became the most influential organ of the anti-Ally propaganda. The circulation of these seditious newspapers was never large[7] but they passed from hand to hand and wrought untold harm among the ignorant people. Their circulation was never seriously interfered with.[8]

[1] Much bitterness was afterwards caused by the transference—under stress of circumstances at the front—of the artillery of the 16th (Irish) Division to the Guards.

[2] On Whit Sunday 1915, 1,100 Irish Volunteers, 700 of them armed, held a parade in Limerick. When returning to the station through the Irishtown quarter, where many soldiers' families lived, they were furiously attacked by a crowd of women (wives of the Munster Fusiliers) and had to be protected by the R.I.C.

On Nov. 19, at Loughrea in Galway, on the formation of a branch of the Irish Volunteers, the National Volunteers marched through the town and smashed the windows of prominent Sinn Feiners.

[3] Reports of County Inspectors. The numbers of the Nationalist Volunteers given in the subjoined table, showing fluctuations during the year preceding the Easter 1916 rebellion, are taken from the official returns. Those in the sections marked (*a*), (*b*), (*c*) were reckoned as disloyal.

| | National Volunteers (Redmondite) | National Volunteers (in sympathy with MacNeill) (*a*) | Irish Volunteers | | Citizen Army (*c*) |
|---|---|---|---|---|---|
| | | | County Dublin (*b*) | | |
| May 6 1914 | 26,696 | | | | |
| Oct. 7 1914 | 178,649 | 7,443 | 2,150 | | 60 |
| Dec. 16 1914 | 152,090 | 11,247 | 2,100 | | 60 |
| Jan. 15 1915 | 149,742 | 9,543 | 2,100 | | 60 |
| Dec. 27 1915 | 112,446 | 5,112 | 6,137 | 2,225 | 100 |
| Jan. 3 1916 | 112,050 | 5,038 | 6,355 | 2,225 | 100 |
| April 17 1916 | 104,984 | 4,457 | 8,381 | 2,225 | 100 |

[4] "Up to Nov. 1914 anybody could send arms or ammunition into Ireland provided the Customs regulations had been complied with." Evidence of Sir Mathew Nathan, Under-Secretary for Ireland, before the Royal Commission (*The Times*, May 19 1916).

[5] Sporting guns and ammunition were excepted. This exception was cancelled on Feb. 5 1915.

[6] *Ireland* speedily reappeared as *Scissors and Paste* (Dec. 12 1914). This consisted of cuttings from British and foreign newspapers "selected for their derogatory references to the cause and military operations of the Allies and for their praise of the methods and successes of the enemy." It was suppressed on March 2.

[7] Circulation of Sinn Fein papers:—

| | Nov. 1915 | Feb. 1916 |
|---|---|---|
| *Irish Volunteer* | 3,937 | 4,615 |
| *The Spark* | 1,587 | 2,382 |
| *Workers' Republic* | 1,390 | 1,549 |
| *Hibernian* | 2,555 | 2,567 |
| *Nationality* | 3,895 | 4,539 |
| *Honesty* | 1,250 | 1,592 |
| *Irishman* | — | 1,692 |
| *The Gael* | — | 1,246 |

[8] In his evidence to the Royal Commission on the 1916 rebellion, Maj. Price, Assistant-Commissioner of Police, said: "One unfortunate thing which hindered us a good deal was the attitude of the official Nationalist party and their press. Whenever Gen. Friend did anything strong in the way of suppressing or deporting these men (the organizers) from Ireland, they at once deprecated it, and said it was a monstrous thing to turn a man out of Ireland." On this the commissioners made the shrewd comment: "Irishmen no doubt appreciate the maintenance of order, but they appear to have an inveterate prejudice against the punishment of disorder." (Cd. 8279, p. 7.)

In July 1914 orders were issued under the Defence of the Realm Regulations for the expulsion from Ireland of four Sinn Fein agitators—Pim, MacCullagh, Blythe and Mellowes. They disobeyed and were arrested and imprisoned. The Limerick Corporation passed a resolution condemning the authorities for expelling Irishmen from their country.

So early as June 15 1914 the inspector-general of the Royal Irish Constabulary had presented to the Chief Secretary, Mr. Birrell, a report of which the following paragraph reads now like inspired prophecy:—

In Ireland the training and drilling to the use of arms of a great part of the male population is a new departure which is bound in the not distant future to alter all the existing conditions of life. Obedience to the law has never been a prominent characteristic of the people. In times of passion or excitement the law has only been maintained by force, and this has been rendered practicable owing to the want of cohesion among the crowds hostile to the police. If the people became armed and drilled effective police control would vanish. Events are moving. Each county will soon have a trained army far outnumbering the police, and those who control the Volunteers will be in a position to dictate to what extent the law of the land may be carried into effect.[1]

Throughout 1915 and the early months of 1916 the police continued to warn the Government of the dangerous character of the Sinn Fein agitation. At a meeting of the Council of the Irish Volunteers, on May 30 1915, a resolution, moved by Mr. Bulmer Hobson, in favour of an immediate rising had only been defeated by the casting vote of the chairman, Prof. MacNeill; and in Dec. the movement had become so menacing that the Under-Secretary, Sir Mathew Nathan, wrote to Mr. Birrell pointing out the futility of the efforts of Messrs. Redmond and Dillon to minimize it, and the serious consequences that might easily ensue if it were not dealt with in time.[2] Lord Midleton, leader of the Southern Unionists, had already more than once urged upon the Chief Secretary the necessity for disarming the disloyal Volunteers and prosecuting the leaders. But none of these representations produced the slightest effect.[3] Indeed, so far from the arm of the law being strengthened, it had been appreciably weakened by the passing on March 16 1915 of the second Defence of the Realm Act, by which any British subject could claim trial by jury for an offence against the regulations. In Ireland, this was tantamount to enacting that no offender should ever be convicted, for neither the juries nor the local J. P.'s could be trusted to return verdicts or decide in accordance with the evidence.[4] At this time the only tribunals that could be relied upon were those presided over in the country districts by two resident magistrates, who constituted under the Crimes Act a special court in cases of riot or unlawful assembly, or by the metropolitan or stipendiary justices in Dublin or Belfast; and these tribunals had no power to impose a greater sentence than six months' hard labour.

*Weakness of the Government.*

In vain the heads of the Royal Irish Constabulary pointed out to the Government, in Jan. 1916, that it was impossible to get juries to convict on the clearest evidence, that in various parts of Ireland the ordinary justices—whether through fear or favour—were just as bad, and that to meet the situation an amendment of the Defence of the Realm Act was absolutely essential. Conversations followed; but nothing was done.

The Sinn Fein organization, however, helped mightily by the feeble efforts of the authorities to discourage it, was gaining strength and vigour. It had won a notable victory when at the annual festival (Oireachtar) of the Gaelic League, held at Dundalk on July 24–9 1915 the majority of the elected candidates for the executive committee were Sinn Feiners. The League thus became a political body, and its founder, Dr. Douglas Hyde, resigned the presidency as a protest against a change of character with which he, though an ardent Nationalist, had no sympathy. From this time onward the police reports record an ever increased activity on the part of Sinn Fein. The movement, in spite of the efforts of some of the bishops, had even been joined by many of the younger Roman Catholic clergy, the most conspicuous being Father Michael O'Flanagan, a priest from Roscommon, who on the anniversary of the "Manchester martyrs" declared that the work of the Irish people was to get rid of the connexion with England, and that if there were no other way to get rid of it, he prayed for the victory of an enemy who would deprive England of her power.[5] In Oct. it was reported that the Irish Volunteers had planned a rising, ostensibly in opposition to conscription, an object which would have enlisted the sympathies of many Redmondite volunteers, and on the 6th an attack on the Castle was actually rehearsed by them without interference on the part of the authorities. On Nov. 14 a large parade of Irish Volunteers was held at Athenry, in Galway, at which shots were fired, a display of force which—according to the police reports—overawed the people, who "disapproved of the Sinn Fein policy, but were afraid to show this, as they had no confidence in either the will or the power of the Government to protect them." With the opening of 1916 the seditious activities increased. The *Workers' Republic* for Jan. 8 advertised the sympathy of the Citizen Army for the Irish Volunteers, and quoted with approval the words of Fintan Lalor in the *Irish Felon* of 1848—that the one question was how best to kill or capture the 40,000 men "in the livery and service of England" who were in occupation of Ireland. Large quantities of explosives were now continually being stolen from quarries and railway stores,[6] and it was noted as significant in connexion with this that articles on the use of explosives were published in the *Irish Volunteer*. In Feb. the Irish Volunteers began to take up "a truculent attitude" towards recruiting meetings, men armed with guns and pikes attempting to break them up. On St. Patrick's Day (March 17) they held parades throughout the country, 4,555 turning out in the provinces and 1,400 mustering in College Green in Dublin; and the leaders issued manifestos affirming their right to be armed and declaring that any attempt to disarm them would be resisted by force.[7]

*Growth of Sinn Fein.*

It is now known that resistance to a threatened disarmament was to be the pretext for the rising planned for Easter 1916 in concert with the German Government. On April 19 Alderman Thomas Kelly,[8] at a meeting of the Dublin Corporation, read a circular[9] purporting to set out certain "precautionary measures" sanctioned by the Irish Office on the recommendation of the general officer commanding forces in Ireland, measures involving the arrest of all

*The Easter Rebellion 1916.*

[1] Royal Commission Report (Cd. 8279), p. 8.

[2] *ib.* p. 9.

[3] "The witness (Maj. Price, intelligence officer of the Irish Military headquarters) read an account of the parade of the Irish Volunteers in College Green on St. Patrick's Day, and said it was a translation of a letter to America dated April 14 last, written in Irish from St. Mary's College, Rathmines, Dublin. He had described that as an extremely bad letter, pointing to some outbreak during the summer of this year. The letter had been sent to the Chief Secretary, the Under-Secretary and the Lord Lieutenant. The Under-Secretary wrote *re* the outbreak in the summer, 'I look upon it as vague talk.' Mr. Birrell wrote, 'The whole letter is rubbish'; and Lord Wimborne initialed it. 'That is only typical,' added the witness." Report of inquiry by the Royal Commission (*The Times* May 26 1916).

[4] On Feb. 24 1915 John Hegarty and James Bolger were arrested for unlawful possession and larceny of high explosives. At the time of their arrest the D. R. Regulations provided for trial by court-martial only, but as the Act was under amendment in Parliament decision in the case was deferred, and when it was decided to try the men the amending bill had passed, and they had the right to be tried by jury. In April, at the Dublin City Commission, the grand jury returned a true bill against them. But when they came to be tried, Hegarty—in spite of overwhelming proof—was acquitted on the charge in connexion with the explosives. On the further charge of writing and uttering seditious statements the jury disagreed; and the same thing happened at the June commission. Both prisoners were then discharged and placed under military supervision. In Hegarty's bedroom the police had found 19 sticks of gelatine dynamite, some fuse and 303 cartridges, and seditious literature.

[5] The attitude of the Church throughout was equivocal. There can be no doubt that, apart from the strong Nationalist sympathies of the Roman Catholic clergy, the victory of the Central Powers was ardently desired by many, who regarded France as an "infidel" country, and saw in the defeat of the Entente the best hope of restoring the temporal power of the Papacy.

[6] On Jan. 15 1916 90 lb. of dynobel were stolen from the colliery of Messrs. Addie and Sons in Lanarkshire, and taken to Dublin. Two men were arrested for this.

[8] Elected Lord Mayor of Dublin in 1920 while in prison in England for sedition.

[9] Report of the Royal Commission (Cd. 8279), p. 11.

the Sinn Fein leaders and the occupation by the military of all important centres in Dublin. This document was a forgery, but it undoubtedly acted as one of the proximate causes of the outbreak. On the previous day, the 18th, news reached Dublin Castle that a ship had left Germany for Ireland on April 12, accompanied by two German submarines, that it was due to arrive on the 21st, and that a rising had been planned for Easter eve. On the 22nd the *Irish Volunteer* announced, under the heading "Headquarters' Bulletin," that arrangements were all but complete for "a very interesting series of manœuvres at Easter," and that the Dublin programme might well stand as a model for others. But on that very day it was also announced that the German ship "Aud," laden with arms and ammunition, had been captured off the coast of Kerry, and that Sir Roger Casement, who had landed at Banna with two companions from a German submarine in a collapsible boat, had been arrested.[1] The same evening, since all prospect of a successful rising seemed to be at an end, Prof. MacNeill, as chairman of the Council, issued orders countermanding the Easter parades. This action put the authorities, who were fairly accurately informed of what was passing, off their guard; immediate danger was supposed to be at an end; and no orders were given to bring troops into Dublin or to stop the leave of officers. Under the influence of James Connolly, however, the more violent section of the volunteers—the Inner Council of which MacNeill was kept in ignorance[2]—decided to go on with the movement, owing, it is said, to information having reached them on Sunday night that the headquarters, with stores of explosives and arms, were to be raided on Monday.

When, on the beautiful morning of Easter Monday, the Irish Volunteers and Citizen Army paraded in various parts of Dublin, the holiday crowds believed it to be no more than the usual "play-boy" display. They were soon undeceived. The plan of the insurrection included the seizure of buildings and places commanding strategic positions in the city, the Castle, the Four Courts, the Post Office, Stephen's Green, certain factories, and, above all perhaps, Trinity College, which commands the intersection of all the main arteries in College Green. In the first surprise the rebels succeeded in occupying the Post Office in Sackville Street, which gave them the command of the whole telegraph system,[3] the Four Courts, Stephen's Green, and Jacob's biscuit factory. The attack on Trinity College was beaten off by a few cadets of the Officers' Training Corps, assisted by some of the college staff, while the Castle was made safe by the arrival of a small detachment of troops in the early afternoon. The first attack on the Castle had been signalized by the brutal murder of an unarmed policeman, and the same ruthlessness characterized the proceedings of the rebels elsewhere. Everyone in uniform was marked out for death, and among the victims were not only unarmed officers and police, but army doctors, wounded soldiers in hospital uniform, and elderly members of the Veterans' Corps returning unarmed from a route march.[4] In Stephen's Green a carter was shot in cold blood for resisting the requisitioning of his cart to add to a barricade.[5]

***The Rising in Dublin.***

It is not to be supposed that the young idealists who were the nominal leaders of the rebellion all approved of this butchery—at the headquarters in the Post Office British officers were held prisoner and treated kindly enough—but they had unloosed forces which they were unable to control. As soon as it was clear that the city was at the mercy of the armed rebels the police, who were unarmed, were withdrawn from the streets. The under-world of Dublin seized its opportunity. A seething mob issued from the slums, invaded the main thoroughfares and looted the shops; but for the fact that most of the banks and some of the best shopping centres were commanded by the rifles of Trinity College, the loss and destruction would have been greater than it was. Presently the terror of fire was added to mob violence. How the fire originated is not known; it may well have been the work of irresponsible incendiaries among the looting mob. However this may be, on the night of April 26–7 several fires broke out in this quarter; the fire brigade could not get to work because it was fired on by the rebels; and in the end a considerable part of Sackville Street, including the General Post Office, together with part of the surrounding area, was reduced to ruins.

The rebellion was heralded on the morning of the outbreak by a proclamation "to the people of Ireland," issued in the name of "the Provisional Government of the Irish Republic." After denouncing the long usurpation of the right to govern Ireland by a foreign people, this proclaimed Ireland a sovereign and independent state, adding that "the Irish Republic is entitled to, and hereby claims, the allegiance of every Irishman and Irishwoman":—

> "Having organized and trained her manhood through her secret revolutionary organizations, the Irish Republican Brotherhood, and through her open military organizations, the Irish Volunteers and the Irish Citizen Army, having patiently perfected her discipline, having resolutely waited for the right moment to reveal itself, she now seizes that moment, and, supported by her exiled children in America and by gallant allies in Europe, but relying first on her own strength, she strikes in full confidence of victory."

The confidence would, perhaps, not have been misplaced had the original plot not miscarried. There were but few troops in Ireland; these were scattered in depots in various parts of the country; and had the unbroken strength of the Irish Volunteers been available, it is probable that all Dublin would have been occupied by them and the task of putting down the rebellion rendered tenfold more difficult, if not impossible. As it was, the prompt concentration of such troops as were available[6] enabled the authorities to maintain their position in the city pending the arrival of reënforcements with artillery in sufficient numbers to enable them to surround and isolate the rebel detachments, and so to reduce them without undue destruction of life and property.

The task was one of immense difficulty. The rebel leaders had laid their plans ably enough. Apart from the occupation of strategic positions in the heart of the city itself, they had posted detachments in hastily fortified houses commanding the approaches from the port of Kingstown, while armies of snipers occupied the roofs everywhere. Their failure to capture Trinity College and the Castle, however, seriously affected their plans, and by mid-day on the 25th the military had succeeded in cutting off the rebels on the north side of the Liffey from those on the south by a line of posts established from King's Bridge Station via the Castle to Trinity College. Towards the evening of the 25th the 178th Infantry Brigade began to arrive at Kingstown from England and was at once directed on Dublin. It was during this advance that the military suffered the heaviest casualties. This was especially the case near the bridge over the canal at Lower Mount Street, where the rebels had entrenched themselves in the schools and houses commanding its approach. Ordered to carry this position at all costs, the 7th Battalion Sherwood Foresters attacked it in suc-

[1] He was tried in London for high treason and hanged on Aug. 3.

[2] John Devoy, editor of the *Gaelic American*, asserted that Prof. MacNeill had been kept in ignorance of the projected rising until the evening of Good Friday, that "he was at first shocked, but on hearing of the shipload of arms consented." The rising was countermanded by MacNeill on receipt of a message from Casement that "all was up." *Documents relative to the Sinn Fein Movement* (Cmd. 1108), p. 19.

[3] The situation was saved by the fact that the telephone exchange in Crown Alley, though commanded on all sides by rebel snipers, was not captured by the insurgents. The girl operators displayed great courage (*Irish Times* May 24 1916).

[4] Five were fatally and many seriously wounded by a volley poured into their defenceless ranks, without warning, by Sinn Feiners in ambush in Haddington Road.

[5] A volley was deliberately fired at a motor in which a friend of the present writer, with his wife, was about to enter Stephen's Green. The lady was shot through the neck and her husband through the arm. An old man who had run out to warn them was pursued into his house, but what happened to him the writer does not know.

[6] On the morning of the second day of the rebellion (the 25th) the forces in the Dublin area consisted of some 2,300 men of the Dublin garrison, the Curragh mobile column of 1,500 dismounted cavalrymen, and 840 men of the 25th Irish Reserve Infantry Brigade.

cessive waves, and succeeded in carrying it, but at heavy cost, four officers being killed and 14 wounded, while of other ranks 216 were killed and wounded. Meanwhile heavy fighting had been taking place in the Sackville Street quarter, where the destruction of Liberty Hall by fire from the gunboat "Helga" enabled the troops to make progress. It was not, however, till the morning of the 28th, when Gen. Sir John Maxwell arrived to take command, that troops were present in sufficient numbers to carry out the plan of encirclement efficiently. A complete cordon was now established round Dublin, and at the same time detachments were ordered to clear the various quarters of the rebels by a steady advance from house to house and street to street. This street fighting was exceedingly trying to the troops, nearly all young recruits, exposed as they were to fire from snipers on all sides, and their courage, discipline and humanity gained them the admiration even of their opponents.[1] The fact that the Volunteers were for the most part not in uniform made the fighting doubly difficult.

On the 29th, the infantry having now been reënforced by a battery of field artillery, the situation of the rebels became hopeless, and at 2 o'clock Pearse surrendered unconditionally, and, in the presence of Sir John Maxwell, wrote and signed notices to the various "commanders" to follow his example. Thomas MacDonagh, who commanded the garrison of Jacob's biscuit factory, at first refused to surrender except on conditions, and two Franciscan friars were deputed to inform Gen. Maxwell of his desire to negotiate. The request was refused, and on the 30th he, too, surrendered unconditionally. These surrenders practically ended the rebellion in the city of Dublin. Throughout the night of April 30–May 1, indeed, isolated rebels continued to snipe the troops, but during the following day these were gradually cleared out, and a systematic house-to-house search for rebels and arms was continued.

The rebellion in the provinces had met with even less success. In general the country remained absolutely quiet. In Kerry, which was to have been the focus of the rising, the capture of the consignment of German arms nipped the insurrection in the bud, and it was only in four counties—Dublin, Wexford, Galway and Louth—that the Volunteers rose in arms. In Louth the rebels accomplished nothing but a single dastardly crime. A party of Irish Volunteers started on the 23rd from Dundalk to Slane, where they spent the night. On the 24th, learning that the Republic had been proclaimed in Dublin, they proceeded to commandeer motor-cars and carts which they met on the way, seriously wounding a farmer who refused to stop. At Castlebellingham they crowned their achievements by placing Lieut. Dunville, Grenadier Guards, whose motor-car they had seized, and Constable Magee against some railings and shooting them both. In county Dublin a more serious affair took place on the 27th. A large party of rebels, led by Thomas Ashe, having been deterred by the sight of 20 soldiers and 8 police, and the more distant vision of two gunboats on their way to Skerries, from carrying out their plan of cutting the English cable at Howth, decided to attack the police barracks at Ashbourne, in Meath. Hearing of the attack, County Inspector Gray, with 54 men of the R.I.C., went north from Navan in motor-cars to engage them. Close to Ashbourne this party fell into an ambush. The Volunteers were estimated to number 400, and the police, after fighting for five hours until their ammunition was exhausted, were forced to surrender. They had lost one officer and six men killed, and their inspector and 14 men were wounded.

*Rebellion in the Provinces.*

This was the only serious encounter in the provinces; for though the Volunteers assembled in Galway, they fled on the slightest sign of effective opposition (only one R.I.C. man was killed) and finally melted away on the 29th without accomplishing anything.[2] In Wexford the rebellion broke out on April 27 at Enniscorthy and spread to Ferns, both places being in the hands of the Volunteers until the arrival of the military on May 1. But the police reported that the movement was unpopular in the county generally, and that large numbers of people assembled in arms to assist the authorities. The surrender of the rebels at Enniscorthy was the closing incident of the rebellion. It had cost the lives of 450 people—soldiers, police and civilians—while 2,614 were wounded.

As soon as the rebellion in Dublin had been crushed, mobile columns, consisting of a company of infantry, a squadron of cavalry, an 18-pounder gun and an armoured car, were sent to the disturbed parts of Ireland, a definite area being allotted to each. In coöperation with the police these arrested dangerous Sinn Feiners and all those who were known to have taken part in the rising. On April 25 the right to try offenders against the Defence of the Realm Regulations had been restored to the military authorities by royal proclamation, and field general courts-martial were at once constituted for the trial of the rebels. In all 3,430 men and 79 women had been arrested, and of these 1,424 men and 73 women were released after inquiry. 170 men and one woman (Countess Markievicz) were tried by court-martial, and of these 159 and the woman were convicted. The remainder of the prisoners, 1,836 men and five women, were sent to England and there interned. Of those convicted by court-martial 15 were sentenced to death and executed,[3] the death sentence in 75 other cases being commuted into penal servitude for terms varying from the duration of life (in one case) to three years, while 23 were sentenced to from two years to six months' imprisonment with hard labour.

*Punishment of the Rebels.*

There can be no doubt that when on April 27 Mr. Redmond expressed in the House of Commons his feeling of detestation and horror for the rebellion, his claim to speak on behalf not only of the Nationalist party but of the overwhelming majority of the Irish people was justified. The troops had been welcomed by the people of Dublin with every manifestation of relief and joy, and the rebellion was hardly suppressed before corporations all over the country began passing resolutions condemning its folly and wickedness.[4] It is the painful duty of the historian to record how in the course of a few weeks this sentiment was completely changed and the rebellion converted, from the Sinn

*Effects of the Executions.*

[1] Mr. James Stephens, in his "Insurrection in Dublin," p. 78, said that there was "no bitterness . . . due to the more than admirable behaviour of the troops you sent over." In his introduction, written later, he says that "it is no longer true that there is no bitterness in Ireland," but he ascribes this to the execution of the rebel leaders (p. 14).

[2] The centres of the rebellion in Galway were Athenry and Loughrea. These were described by County Inspector Clayton in his evidence before the Royal Commission, as "the black spots in Galway." "There were secret societies in this district at all times for years past. They were the centres of much of the land agitation, and many cold-blooded murders were committed there." Reported in the *Sunday Independent*, Dublin, May 28 1916.

[3] The leaders executed were the seven who had signed the declaration proclaiming the formation of the Irish Republic, viz. P. H. Pearse, Thomas MacDonagh, Joseph Plunkett, Edmund Kent, Thomas J. Clarke, James Connolly and John McDermott, together with such prominent leaders as Edward Daly, William Pearse, Cornelius Colbert, J. J. Heaston, Michael O'Hanrahan, John McBride and Michael Mallin. To these must be added Thomas Kent, who was executed for the murder of Head Constable Rowe at Fermoy on May 2.

[4] The attitude of Nationalists towards Sinn Fein before the rebellion, and generally the temper of politics in Ireland, are well illustrated by the following extracts from an account in the *Irish Times* of Jan. 29 1916 of an attempt made by the Sinn Feiners to give a concert at Carrickmore in Tyrone:—

"Desperate fighting of a hand-to-hand character ensued, both within and without the hall, but for the most part the Sinn Feiners held the school, while the Nationalists remained outside. . . . The Sinn Feiners cheered for the Kaiser, and there were shouts of 'Carson' whilst the Nationalists cheered the Allies and the constabulary. . . . Then the Nationalists, having gathered all their reënforcements, delivered a united and determined attack on the roof, doors and windows of the school. . . . An indescribable scene followed. . . . There were shrieks for the Kaiser from the Sinn Feiners, and counter-cheers for the Allies, King George and the constabulary, from the Nationalists. The fighting continued till half-past nine o'clock, when the Sinn Feiners decided to abandon the concert, and they were escorted home by the police."

Fein point of view, from a pitiful failure into a famous success. One cause of this change—though not the main one—was undoubtedly the trial and execution of the leaders; for the Irish, though they have no native horror of violence and murder, cannot bear the long-drawn-out procedure of a trial for life or death; and the slow and secret procedure of the court-martial, with the execution day by day of small batches of the condemned men, revolted every instinct of their nature. That the sentences, according to the codes of all civilized nations, were just, made no difference. Public opinion swung suddenly and violently round. The book-shops of Dublin, in an incredibly short time, reflected the public sentiment by filling their windows with the portraits and works of the "martyrs."

To this sentimental appeal a practical one, even more potent, was soon to be added. By Nationalist Ireland the rebellion had been condemned as criminal folly because it was believed that it had indefinitely postponed all prospect of Home Rule; and it was generally thought that the Government would seize the occasion to extend the Military Service Act to Ireland. Mr. Asquith, however, believing that the punishment already inflicted had been enough to prove the power of the Government, determined to try a policy of generous conciliation. He was helped in this by the attitude of certain of the Nationalist members, who, feeling that their influence in Ireland was in danger, showed a disposition to "hedge" in the matter of the rebellion. On May 11 Mr. John Dillon, Mr. Redmond's principal lieutenant, moved the adjournment of the House to discuss the executions, and in the course of a violent speech, in which he accused the Government and soldiers of washing out the life-work of the Nationalist party in "a sea of blood," he took occasion to say that he was "proud of the rebels." In his reply Mr. Asquith defended Gen. Maxwell and the troops from the wild charges brought against them, and announced that he himself was going to Ireland that evening to consult the civil and military authorities with a view to arriving at some arrangement for the future government of Ireland that would commend itself to all parties.

*Mr. Asquith's Visit to Ireland.*

The days spent by Mr. Asquith in Ireland, May 12–8 1916, mark an epoch in Irish history. The mere fact of having brought the Prime Minister to Ireland was in itself a triumph for Sinn Fein. But, in addition to talking with "representative exponents of the various shades and complexions of Irish opinion," Mr. Asquith visited the prisons and "talked with the utmost freedom to a large number of those who had been arrested and detained."[1] The effect was immediate. The prisoners, who had been depressed and in some cases penitent, realized that they had won a victory; their demeanour after Mr. Asquith's departure completely changed and they became boastful, truculent and unruly.[2] The effect was completed when, after his return to London, the Prime Minister announced to the House of Commons (May 25) that the dominant impression left on his mind by his visit was "the breakdown of the existing machinery of Irish Government," and that he had commissioned Mr. Lloyd George to negotiate with the Irish party leaders with a view to a compromise which would enable the Government of Ireland Act to be brought into immediate operation. The rebellion was thus advertised to all the world as the most successful failure in history. So far from destroying the prospects of Home Rule it had brought that blessing within measurable distance, and what years of constitutional agitation had failed to secure had been secured by one short week's armed argument. At the end of the year the police reports from every part of Ireland announced a general movement of Nationalist opinion towards Sinn Fein.[3]

*Negotiations for a Settlement.*

A new weapon was put into the hands of Sinn Fein as the outcome of the negotiations conducted, under the auspices of Mr. Lloyd George, between the Nationalist and Ulster leaders with a view to a compromise. On June 10 Mr. Redmond announced to a meeting of his supporters in Dublin that Mr. Lloyd George had proposed in the name of the Government that the Home Rule Act should be brought into immediate operation, but that an amending bill should be introduced providing for the retention of the Irish members at Westminster, and for the exclusion of six Ulster counties from the operation of the Act during the continuance of the war and for a short period after it. On the 12th the Ulster Unionist Council, whilst reaffirming its unalterable objection to Home Rule, decided in the interests of the Empire to give full authority to Sir Edward Carson to continue negotiations with Mr. Lloyd George on the basis of the definite exclusion of the six counties. Mr. Joseph Devlin used all his great influence to persuade his followers in Belfast to agree; and on June 23 a meeting of Nationalists from the six counties decided by a large majority to accept the principle of temporary exclusion.

*Irish Opinion and the Proposed "Partition."*

What followed is somewhat obscure. It is clear, however, that there must from the first have been a misunderstanding or what might be regarded as a misrepresentation; for the Ulstermen were as little disposed as ever to come under a Home Rule Government, except by their own consent. By the southern Unionists, on the other hand, and the large body of those living in the counties of Ulster which were not among those excluded, the suggested compromise was viewed with dismay, and numerous meetings of protest were held, at which it was pointed out, with some force, that in making special arrangements for the six counties the northern Protestants had been guilty of breaking the solemn Covenant to which they had subscribed three years earlier.[4] Whatever the reason may have been—original misunderstanding, or subsequent Unionist pressure within the Cabinet—the statement made by Mr. Asquith on July 10 as to the suggested settlement, and still more Lord Lansdowne's glosses on it in the House of Lords, roused indignant protests from Mr. Redmond and his followers, for it became known that a pledge had been given to Sir Edward Carson that the six counties would be definitely excluded from the operation of the Act and could not be included again without a fresh bill. This, together with Lord Lansdowne's statement that Gen. Maxwell would be retained in his command, that the Defence of the Realm Regulations would be strengthened, and that the prisoners would not be amnestied, was described by Mr. Redmond as an insult to Ireland and tantamount to a declaration of war against the Irish people; he demanded strict adherence to the basis of the negotiations to which he had agreed and announced that any departure from this would bring the negotiations to an end. Matters came to a crisis on the 24th, when, in answer to Mr. Redmond, the Prime Minister said he would not introduce any

[1] Mr. Asquith's statement in the House of Commons (May 25), *The Times* May 26.

[2] From information supplied by an official eye-witness.

[3] "At the time of the rebellion the people generally condemned it, but the speeches of Mr. Dillon and others in the House of Commons on the subject, and the visit of the Prime Minister to Ireland in order to effect a settlement of the Home Rule question caused a strong reaction in Nationalist circles in favour of the rebels, as it was felt that the rebellion had done more than ten years of constitutional agitation to convince the Government of the urgent necessity for Home Rule" (police report from county Monaghan).

"Then came the visit of the Prime Minister to Ireland, his statement in the House of Commons, the announcement that Home Rule must immediately be granted, followed by Mr. Dillon's speech in the House eulogizing the rebels, and finally the letters of the Bishop of Limerick (Dr. O'Dwyer, who denounced the execution of the 'poor boys' who had headed the rebellion). These changed the whole feeling. The Sinn Feiners from being objects of contempt became heroes" (report from county Tyrone).

"The people generally had no sympathy with the rebels until after Mr. Asquith's speech in the House of Commons and his visit to Ireland, which, coupled with the execution of the leaders, completely changed the feelings of a large number of people" (report from Kilkenny).

[4] The Ulster argument was that they were keeping the Covenant in spirit, if not in the letter, because a separate Ulster Government, with a Catholic minority under it, would be a better guarantee for the just treatment of Protestants in Catholic Ireland than if the whole Protestant body were to form a minority in a Catholic State.

ill unless there were substantial agreement between the parties. This meant the collapse of the whole effort, Mr. Lloyd George asserting that it was impossible to bring the Act into operation during the war except on the terms announced by the Prime Minister. Mr. Redmond, for his part, pointed out the "deplorable effects in Ireland" of the failure of the Government to carry out the terms of the agreement, a failure which was bound to increase Irish suspicion of their good faith, and ended by announcing that, while he would continue to support the war, he would henceforth hold himself free to criticize the conduct of the Government.

*Breakdown of the Negotiations.*

The temper of the Nationalists was not improved by Mr. Asquith's announcement on July 31 that Mr. (afterwards Sir Henry) Duke, a Unionist, had been appointed to succeed Mr. Birrell as Chief Secretary, and by the further appointment of Mr. (afterwards Sir) James Campbell, junior member for Trinity College and Sir Edward Carson's lieutenant in the Ulster movement, as Irish Attorney-General. This "restoration of the Castle regime, with a Unionist executive" was, in Mr. Redmond's language, another insult to Ireland, and on Aug. 1 a Nationalist meeting in Dublin protested against it.

The only gainers by Mr. Asquith's unfortunate attempts at a settlement by compromise were the Sinn Feiners, who from this moment never allowed the Irish people to forget that Mr. Redmond and his party had consented to the "partition of Ireland." Mr. Redmond did his best to undo these disastrous effects of his moderation. When, in the autumn, the question of extending the Military Service Act to Ireland was again raised, and its extension strongly supported by Irish Unionists, he threw himself into violent opposition. To his constituents at Waterford, on Oct. 6, he said that "conscription" was the most fatal thing that could happen to Ireland, and on the 18th, two days after the publication of the report of the Royal Commission on the shooting of Mr. Sheehy-Skeffington,[1] he moved a resolution in the House of Commons practically amounting to a vote of censure; charged the Government with maintaining in Ireland a system of administration inconsistent with the principles for which the Allies were fighting; demanded the recall of Gen. Maxwell and the abrogation of martial law; asked for the release of 500 untried prisoners, and the treatment of the rest as prisoners of war; and ended by adjuring the Government to show its trust of the Irish people by putting the Home Rule Act into immediate operation.

*Decline of Mr. Redmond's Influence.*

To all this Mr. Asquith replied, with perfect accuracy, that though martial law existed in Ireland, it was not in operation,[2] the occasional suspensions of the right to trial by jury being under the Defence of the Realm Act. Mr. Duke, the Chief Secretary, said with equal truth that the real obstacle to Home Rule was the disagreement among Irishmen, and that the only chance of obtaining it was for them to present an agreed scheme to Parliament. As for "martial law," peaceful Irish subjects must be protected, and there were men still free in Ireland who were ready at the first opportunity to repeat the proceedings of Easter week.

*"Martial Law" in Ireland.*

That this was true, and that these men were still looking for help to Germany, is proved by the intercepted correspondence of Count Bernstorff, the German ambassador in Washington. "No parades of volunteers are allowed," wrote an anonymous correspondent to him on June 30 1916, "the organization is supposed to be dead, but they are keeping in touch with each other and their spirit is excellent. Very few arms have been given up in the country and no munitions. . . . Though many arms are hidden safely there are not sufficient for future offence, unless supplemented. . . . Our present position is this: There is not a leader left. The men are there and the women too, full of spirit, but all the real brains of the organization are dead or locked up. Anyone who could voice the desires of the country to be represented at the Peace Conference is not here to do it. . . . What we need now is to get into touch with America if possible. . . . Tell John Devoy and the Clan-na-Gael that our hearts are full of courage, but that we count on them to help us." The fear that a measure of Home Rule might be granted and that John Redmond might go to the Peace Conference as Ireland's representative torments the writer:—"Better martial law and Gen. Maxwell."[3]

There was in fact no martial law in Ireland; for martial law implies the entire supersession of the ordinary law, of which Mr. Duke, the new Chief Secretary, was a meticulously jealous guardian. The result of the consequent friction between the civil and military authorities presently became apparent; on Nov. 5 Gen. Maxwell was recalled, under pressure from the Nationalist members in Parliament; and Sinn Fein, which had fallen silent during the months succeeding the rebellion, gathered courage to revive its active propaganda.

*Revival of Sinn Fein.*

On Dec. 9 *The Irishman* explained the policy of Sinn Fein to be "a combination of passive resistance to foreign aggression and of a coördinated development of national resources, together with the fostering of national characteristics. It rejects Parliamentarism and other such methods, and seeks in a National Council a lever to upset the whole foreign administration of the country."[4] On the 30th *New Ireland* appeared with an article deploring the life-long imprisonment of Eoin MacNeill, who "saw in the Irish Volunteers the only protection against the armed violence of the Primrose League and its dupes," another—entitled "Ireland's Revenge"—ascribing the refusal of conscription in Australia to the effect of the Easter week rebellion, and yet another ("What will Ireland do?") in which a Catholic curate argued that it was not to Ireland's interest to help to "put down Germany" and compared the lot of Ireland under the British unfavourably with that of Belgium or Poland under the Germans.

Early in 1917 the police reported that the seditious press was becoming very daring and that its influence was probably increasing. On Feb. 17 a new Sinn Fein weekly, the *Irish World*, made its appearance, and on the same day Mr. Arthur Griffith resumed the publication of *Nationality* with an article in which he denounced Mr. Redmond for his speech of May 3 1916, in which he had spoken of the "guilt" of the instigators and promoters of the rebellion. All this, in the language of the police reports, was "a bold renewal of the campaign carried out before the rebellion," and both Gen. Sir Brian Mahon, who had succeeded Gen. Maxwell in the Irish command, and the heads of the police pressed the Chief Secretary to take strong measures. Mr. Duke, however, declined to direct the seizure of these papers, and the seditious propaganda, as in Mr. Birrell's day, went on practically unchecked.

[1] Mr. Sheehy-Skeffington, with two others, had been captured in the streets by a small party of soldiers under Capt. Bowen Coulthurst and taken as prisoner to Portobello Barracks. All three were subsequently shot by order of Bowen Coulthurst. This officer was tried by court-martial and was adjudged to be insane; his mind had been affected at the front, he had been sent to Dublin to "rest," and it was held that the horror and excitement at the outbreak of the rebellion had developed what the evidence showed to be religious mania. The Royal Commission found that Mr. Skeffington had no connexion with the rebellion, that he was in principle a "pacifist," and that he had been engaged in making an appeal to prevent looting and violence. He belonged, however, to the Sinn Fein organization, had taken an active part in the Republican propaganda, and had lectured in the United States against the cause of the Allies. In view of the fact that Mrs. Sheehy-Skeffington, during her lecture tour in America, denounced the "cruel *English* eyes" of the unfortunate young officer who killed her husband, it is necessary to add that he was not English, but belonged to a very old Irish family.

[2] The present writer was in Dublin during this year and is able to vouch for the truth of this. The life of the ordinary citizen, after the removal of the curfew and other restrictions which immediately followed the rebellion, was absolutely uninterfered with. The powers under martial law were merely held in reserve to be used in case of absolute necessity. An extraordinary latitude, not to say licence, was allowed to the seditious press, and even to seditious action so long as it kept within certain limits and did not threaten to lead to breaches of the peace.

[3] *Documents relative to the Sinn Fein Movement* (Cmd. 1108), p. 17.

[4] Note that, with the exception of the Chief Secretary, the whole administration of the country was at that time in the hands of Irishmen. The "Castle" is the name given to the whole group of buildings occupying the site of the old royal castle in Dublin, including the Lord Lieutenant's town residence and the Irish Government offices.

The year 1917 was, indeed, an extremely critical one for the Union Government in Ireland, and saw the beginnings of that policy of alternate concession and repression which was to lead to the disastrous situation of 1920 and 1921. The entry of the United States into the war on the side of the Entente was, of course, a blow to the Sinn Feiners. They did not, however, give up the idea of securing separate representation for Ireland at the Peace Conference, and meanwhile they revived the plan of making "English" Government in the island impossible by an organized system of passive resistance to, and boycotting of, the authorities. To make this system a success, however, it was necessary to enlist the active sympathy of the mass of the agricultural population, and to this task they set themselves. The old motives of agrarian discontent were no longer available for political purposes; for owing to the rise in the value of produce the small holders were enjoying an immense prosperity; it was only here and there that the police reported agrarian disturbances arising out of the agitation for the breaking up of the grazing lands. It was necessary to find other means of appealing to the Irish farmers and peasants, and these means were found in the possible effects upon Ireland of Great Britain's need for men, money and food to carry on the great struggle, which had reached its most critical stage with the beginning of the "ruthless" submarine war by Germany in Feb. of that year. The "anti-conscription" cry had already served its purpose. To this were now added appeals to the farmers on the ground that Ireland would be bled white by war-taxation and starved in order that the British might be fed.

*America Enters the War. New Sinn Fein Policy.*

Of these cries the most effective, next to "conscription," was the promise that independent Ireland would be relieved not only of war-taxation but also of the whole burden of the national debt,[1] and there can be no doubt that it largely contributed to the later victories of Sinn Fein at the polls. But more immediate and obvious in its effect was the agitation against the system of food-control which the submarine menace had made necessary. "The 'clutching hand' is out to capture our food," was the cry;[2] the maximum meat prices would destroy the cattle trade; and the export of bacon and butter to England would lead to starvation in Ireland. All this had its effect. The Government, following the traditional policy of humouring Ireland, excluded her from the more drastic conditions of the food-control, and actually forbade the free export of bacon and butter to England. It is not too much to say that during the critical years of the war Ireland was not only more peaceful and prosperous than she had ever been, but was the only peaceful and prosperous country in Europe.

But Sinn Fein, encouraged by the almost complete immunity of its press—which even the censorship could only control within very narrow limits—continued its preparations. The beginning of the year saw the launching of the official Sinn Fein organization in the United States (Jan. 18) under the auspices of the Friends of Irish Freedom, and a beginning was made of a vast propaganda, which was to flood the world with the most amazing myths about conditions in Ireland. The new *point d'appui* in America, however, was to be used for more than propaganda, and early in Feb. the Government learned that the Germans had planned to land another huge consignment of arms and ammunition on the coast of Galway between the 21st and 25th of the month.

*New German Plot.*

"Adequate arrangements were made, and the consignments did not reach Ireland"; but it was clear that Sinn Fein, through its agents in America, was still in touch with Berlin and still hoped for a German victory. It was this hope which inspired the Sinn Fein executive with the idea of drawing up a statement of "Ireland's Case for a Peace Conference," claiming sovereign independence, and demanding from the Powers to be assembled that "that sovereignty be now recognized and established under their security."[3] In Germany the "Case" had a sympathetic reception, and shortly after the American declaration of war (April 4) a "German-Irish Society" was founded in Berlin by Prof. Kuno Meyer, acting in concert with St. John Gaffney, a former American consul, and Dr. George Chatterton-Hill, "a *soi-disant* Irishman, born in Madras, educated at Geneva, and resident for many years in Germany."[4] Its organ, *Irische Blätter*, held out the prospect to Ireland of being made self-reliant "by the employment of efficient German education, industrial organization and military training."

The Irish Nationalist party viewed with alarm the growing influence of Sinn Fein, whose organs—presently increased by a new batch of weeklies, *The Leader*, *Irish Opinion*, *The Irish Nation* and *The Phoenix*—poured derision and abuse upon Mr. Redmond and his followers. Mr. John Dillon took the lead in the effort to counter this campaign. He declared publicly that he had never stood on a recruiting platform and never would. In response to his pressure, Mr. Duke announced on Dec. 22 1916 that the 600 rebel prisoners interned in Wales were to be unconditionally released. But in vain did the Nationalist organ, the *Freeman's Journal*, try to make capital out of this for the Parliamentary party; the Sinn Fein papers scoffed at its claims to have effected anything; it was fear, and fear alone, which had dictated the action of the Government; "one direct appeal to America by the Dublin Corporation effected more than all the 'blethers' at Westminster."[5]

*Sinn Fein and the Nationalist Party.*

The release of the interned rebels was greeted by the Sinn Fein as a triumph; and on Feb. 5 it gained its first victory at the polls by the return of Count George Plunkett, father of one of the executed leaders of the Easter rebellion, for North Roscommon.[6] The discovery of the German plan to land arms followed; the Government decided to take vigorous measures; and 28 Sinn Fein agitators, all of them implicated in the late rebellion, were arrested on the 23rd and deported by order of Sir Brian Mahon under the Defence of the Realm Regulations. The Nationalist party now took a further step in the direction of Sinn Fein, Mr. Dillon moving the adjournment of the House of Commons on the 26th as a protest against the deportation of men without trial. On March 7 Mr. T. P. O'Connor, member for the Scotland division of Liverpool, moved a resolution in favour of the immediate bestowal upon Ireland of "the free institutions long promised her," and in the course of the debate that followed Mr. Lloyd George, who had succeeded Mr. Asquith as Prime Minister on Dec. 5 1916, defined the principle on which the Government was prepared to act. The Government, he said, was willing to give Home Rule at once to any part of Ireland which desired it, but could not take any action to force Home Rule on the portion of Ireland to which it was repugnant. He suggested that the details of a settlement on this basis might be arranged either by a conference of Irishmen or by a commission, and ended by moving an amendment welcoming any settlement that did not involve the coercion of any part of Ireland. This was met by a violent protest by Mr. Redmond, in the name of the Nationalist party, who said that he would enter into no more negotiations, that the Government was playing into the hands of Sinn Fein, and that

[6] The figures were Plunkett (S. F.) 1,708; Tully (Nat.) 687.

he and his followers would withdraw and consider apart what they would do. The Nationalists then left the House in a body. Next day they held a meeting, at which a statement was drawn up repudiating the right of a small minority in N.E. Ulster to have a veto on self-government for a united Ireland, and appealing to men of Irish blood in the Dominions and the United States to bring pressure to bear upon the Government to act towards Ireland "in accordance with the principles for which they were fighting in Europe."

For more than two months no further open attempts at a settlement were made, and meanwhile in Ireland itself Sinn Fein gathered courage and force. On Feb. 23 it had gained a footing in the Dublin Mansion House when Alderman O'Neill succeeded Sir William Gallagher as Lord Mayor. On March 6 a Royal Irish constable was fired at and wounded in Ennistymon—a sinister portent in the light of later events. On the 21st Count Plunkett, who had received the freedom of the city of Sligo four days earlier, issued a circular calling for a Sinn Fein conference and stating that the duty had been cast upon him of inaugurating a policy for Ireland. As the anniversary of Easter week approached the tension increased. On April 2 the Dublin Corporation passed a resolution demanding an amnesty of the rebel prisoners, and on the 9th (Easter Monday) there were disturbances in Dublin, where the Sinn Fein flag was hoisted on the ruins of the Post Office, and in Cork, where, after high mass in the cathedral for the souls of the executed leaders, a noisy crowd of Sinn Fein demonstrators had to be dispersed by the police. The most significant episode, however, was the meeting at the Dublin Mansion House, on April 19, of the conference summoned by Count Plunkett. There were present between 500 and 600 delegates from elective bodies throughout the country, and from labour organizations, the Ancient Order of Hibernians, Sinn Fein clubs and the Women's League, together with about 100 representatives of the younger Roman Catholic clergy. In his address Count Plunkett declared that "they would not be fettered slaves—and that any offer that England had to make that was short of complete liberty would be treated with contempt," and he ended by proposing a long series of resolutions asserting the right of Ireland to complete independence and to representation at the Peace Conference, and pledging those present "to use every means in their power" to attain the complete liberty of Ireland. After these resolutions had been carried unanimously, Mr. John Milroy moved, and Mr. Arthur Griffith seconded, a resolution in favour of united action between such bodies as Sinn Fein, the Nation League, the Irish-American Alliance, the Irish Volunteers, and the Irish Labour party, and proposing that, in order to secure control of public institutions and elective bodies, a Council, to be called the Executive Council of the Irish National Alliance, be created, with instructions to bring into being at the earliest possible moment a constituent assembly, to be known as the Council of the Irish Nation. This resolution, however, the chairman refused to put to the meeting, as too directly aimed against a still powerful section of Nationalist opinion, and he substituted one couched in more general terms, namely, "That we desire to establish an organization to unite Irish advanced opinion, and provide for action as a result of its conclusion." This was carried by acclamation.[1] Sinn Fein was thus provided with the nucleus of a national organization. It was soon to be provided once more with the brains to make this organization effective.

*Agitation for an Amnesty.*

*Organization of Sinn Fein.*

On May 16 the Prime Minister addressed to Mr. Redmond a letter in which he made two alternative proposals for the settlement of the Irish question:—(1) the immediate introduction of a bill for the application of the Act of 1914, subject to an amendment providing for the exclusion for five years of the counties of N.E. Ulster; (2) the summoning of a Convention of Irishmen of all parties for the purpose of devising a scheme for Irish self-government. That the first of these proposals would find favour was improbable, in view of the unpopularity already incurred by the Nationalist party owing to their concessions to the principle of "partition"; and the improbability was increased by another Sinn Fein victory at the polls on May 10, Mr. McGuinness, the Sinn Fein candidate, being returned by a majority of 37 over the official candidate of the Nationalist party.[2] Mr. Redmond, accordingly, rejected the first proposal, but accepted the second, which certainly gave a better prospect of some tangible result. On behalf of the Southern Unionists Lord Midleton also agreed, on condition that the Convention should be fully representative, and that its decision should be subject to review by the Imperial Parliament. The representatives of Ulster in Parliament said that they would lay the Prime Minister's proposal before the Ulster Unionist Council.[3] Count Plunkett, on the other hand, without waiting for the Government scheme, announced on May 18 that Sinn Fein would take no part in it.

*Fresh Proposals for a Settlement.*

Undeterred by this attitude of Sinn Fein, the Government announced on May 21 that they would summon an Irish Convention empowered to submit to the Imperial Parliament a scheme for the future self-government of Ireland within the Empire. In making this announcement the Prime Minister said that if the Convention reached substantial agreement, the Government would give legislative effect to its decision. It was not, he added, to be an assembly merely of politicians, but of representatives of all Irish interests and opinions, including Sinn Fein. The Government letter was to define the terms of reference, and the debates, in order to obviate undue pressure and intimidation from without, would be held with closed doors. On June 11 the Prime Minister announced the composition of the Convention. Invitations were to be sent to 101 representative Irishmen—chairmen of county and borough councils, with elected representatives from small towns and urban districts; four Roman Catholic bishops, the Protestant archbishops of Armagh and Dublin, and the moderator of the Presbyterian Church; the chairmen of the Dublin, Belfast and Cork chambers of commerce; five representatives of labour from the Trade Councils of Dublin and Cork and the Trade Unions of Belfast; five members each from the Nationalist party, the Ulster Unionists and the Southern Unionists, two from the O'Brienites,[4] and two Irish peers. Five seats were reserved for Sinn Fein; and the Government proposed to nominate the chairman and 15 prominent Irishmen of all sections of opinion. Among those thus nominated were Dr. Mahaffy, Provost of Trinity College, and Mr. George Russell ("A. E."), whose "Thoughts for the Convention," published in the *Irish Times*, won the approval of that fiery Nationalist, Archbishop Walsh of Dublin. Finally, on June 15, Mr. Bonar Law announced in the House of Commons that, "in order that the Convention may meet in an atmosphere of harmony and good-will," the Government had decided to release all the prisoners convicted and sentenced for their share in the rebellion of 1916.

*Irish Convention Announced.*

*Release of the Sinn Fein Convicts.*

This release was unconditional. There was no such "iron-clad" oath as the North had imposed upon the South after the American Civil War. The released Sinn Feiners were free to exercise all the rights of citizenship without first swearing allegiance to the United Kingdom; still less were they required to make a statement, before voting or taking office, that in sharing in the rebellion they had been guilty of "treason and felony." It was an act of political generosity without parallel in history. In Ireland it was very generally regarded as an act of political folly equally without parallel. The Lord Mayor might, in addressing his Corporation, hail the release as "a happy omen of peace and good-will"; but by the mass of the Irish people

[2] The figures were: McGuinness, 1,498; McKenna; 1,461.

[3] The Ulster Council consented on condition that no scheme should be forced on Ulster to which its representatives did not consent (June 8).

[4] Mr. William O'Brien, on June 18, announced his refusal to attend the Convention, on the ground that nine-tenths of its members were "pawned beforehand to partitionist compromise."

it was looked upon as yet another victory for Sinn Fein, and the released leaders were quick to proclaim it as the outcome not of generosity, but of fear.[1] From the first they made their intentions perfectly clear; and their intentions were not peaceful. On the very day of their release (June 18) they joined in signing two appeals to the President and Congress of the United States, calling attention, in the name of "the provisional Government of the Irish Republic," to Mr. Wilson's statement, in his recent letter to the new Russian Government, that "no people must be forced under a sovereignty under which it does not wish to live"; denouncing the "English conspiracy against Ireland" and John Redmond's share in it, notably the "hypocritical sham on the Statute Book" (the Act of 1914); representing the proposed Convention as but a device to find out the minimum that Ireland would accept; and ending by expressing their determination to be content with nothing short of the practical application in the case of Ireland of the principles which the President had enunciated, viz. that of the right of small nations to independence of foreign control. "We are engaged," the appeal of the "officers" concluded, "and mean to engage ourselves in the practical means for establishing this right."[2]

*Sinn Fein Appeals to President Wilson.*

They lost no time in setting to work to organize these practical means. The arrival of 118 released prisoners in Dublin was celebrated by a procession in which Sinn Fein flags were liberally displayed. The return of the liberated prisoners to Cork was the signal for a riot, in the course of which the gaol was wrecked and the military had to fire on the mob. Edward (Eamonn) De Valera, who had been one of the leaders of the 1916 rebellion, at once became the most conspicuous figure in the movement. In vain the Roman Catholic hierarchy issued, on June 19, an "instruction" to priests warning them against "dangerous associations" and "organizations that plot against the Church or lawfully constituted authority," and reminding them that it was strictly forbidden by the statutes of the National Synod "to speak of politics or kindred subjects in church."[3] Among the younger priests national sentiment proved in the long run stronger than ecclesiastical discipline; and the Sinn Feiners knew well that, if they could carry the mass of the people with them, sooner or later the Church would also fall into line. And it seemed as though the mass of the people were willing to be carried. There were, indeed, spasmodic outbreaks against the revolutionists, as when, on July 9, Countess Markievicz was attacked by a Nationalist mob at Ennis. But the true trend of public feeling was soon to be revealed by the election for the parliamentary representation of East Clare, vacant owing to the death of Maj. Willie Redmond at the front. Mr. De Valera had already been selected as the Sinn Fein candidate, and on July 11 he was returned by a majority of nearly 3,000 votes over his Nationalist opponent.[4] He was not slow to point the moral of his victory. In Clare itself he had said that if the Irish people would only combine, they could easily make "English law" impossible.

*Return of the Released Prisoners.*

*Attitude of the Roman Catholic Clergy.*

*East Clare Election.*

Addressing a large crowd in Dublin on the day following the election he explained the method of the combination. It must be under the Republican flag, and no other, and if Ulster stood in the way of Irish freedom, Ulster would have to be coerced.[5] This was said on July 12, the day of the Boyne celebrations, the resumption of which showed that the men of Ulster had no intention of being coerced. Six days later an event of sinister import occurred—Mr. Redmond's severance of his connexion with the National Volunteers (July 18). Col. Maurice Moore,[6] their commander, now announced that a convention would be held to nominate a governing body; and it was held, under his chairmanship, on Aug. 5, when it was decided to reaffirm allegiance to the original declaration of the Volunteers and to elect a committee to negotiate a reunion with the Irish Volunteers. Thus began the formidable organization of the Irish Republican Army; and such was the "atmosphere" in which, on July 25, the Convention met to discuss and settle the future government of Ireland.

*Reorganization of the Volunteers.*

The meeting-place of the Convention was in the hall (known as the Regent House) over the entrance gate of Trinity College, which had been placed at its disposal by the Provost and Fellows. It was felt that the selection of Trinity as the scene of its labours was symbolical of the hoped-for fusion of the two conflicting streams of Irish political sentiment; for the old college founded by Queen Elizabeth, though traditionally loyal, had been a fruitful mother of Irish Nationalist leaders, among its *alumni* being Wolfe Tone and Robert Emmet. It was, however, of evil augury that the assembling of the members was greeted by no popular demonstrations. It was noted, too, that the delegates were nearly all elderly men; young Ireland stood contemptuously and ostentatiously aside; and, indeed, among Irishmen generally there was little belief in any satisfactory outcome of the deliberations. Yet the earlier meetings gave the happiest promise. In Sir Francis Hopwood (afterwards Lord Southborough) the Convention had a secretary who brought to its aid his experience of the not very dissimilar problems presented by the negotiating of the Union of S. Africa, and the general good-will of the members was advertised by the unanimous election to the chair of Sir Horace Plunkett, who had proclaimed his conversion to Home Rule, but without attaching himself to any political party. A grand committee of 20 was elected to consider schemes presented under the terms of reference and to select those considered suitable for discussion. On Aug. 21 the Convention met to consider these schemes, most of which suggested a form of government on the Dominion model, but with modifications to suit the peculiar conditions of Ireland. These debates lasted till Sept. 27, during which time the Convention visited and held several sessions in Belfast and Cork. On the latter date it was decided to refer the various schemes to the grand committee to report, and the Bishop of Raphoe, one of the representatives of the Roman Catholic hierarchy, was commissioned by the chairman to draft the heads of a scheme to serve as the basis of discussion in the committee.

*The Convention.*

The Grand Committee met on Oct. 11, and, to facilitate business, decided to delegate the task of examining the draft scheme to a sub-committee of nine, other sub-committees being appointed to deal with the questions of electoral areas and representation, defence and police, and land purchase. The final report of the committee was presented on Nov. 21. It stated that it had arrived at certain provisional conclusions on most of the heads, but that these were all contingent on full agreement being reached on the general scheme. It was soon clear that no such general agreement was likely to be reached. The first point of fundamental disagreement was as to the safeguards to be provided for permanent minorities. It had been agreed in the sub-committee that the Unionists,[7] North and South, should be guaranteed a 40% representation in the lower House of the Parliament, this proportion to be made up, when necessary, by nomination. This proposal was submitted by the Ulster representatives to the advisory committee, outside the Con-

[6] Brother of George Moore, the novelist. He had commanded a battalion of the Connaught Rangers.

[7] In Ireland the words "Unionist" and "Protestant" are practically synonymous and are commonly used alternatively. "Unionists," as such, would of course cease to exist under Home Rule, and the "safeguard" suggested would therefore have meant the stereotyping of parties on sectarian lines. The objection of Ulster, however, was that the nomination of parliamentary representatives is undemocratic and quite unsuitable to a democratic and industrial community such as N.E. Ulster.

vention, which had been set up to watch and guide their proceedings; and this decided that the proposal, though perhaps defensible in the case of the southern Unionists, could not be accepted in the case of Ulster. Far more fateful, however, was the failure to reach an agreement on the fiscal powers to be given to the Irish Parliament. The Bishop of Raphoe's scheme contemplated that, pending federation of the United Kingdom, there should be no Irish representation in the Imperial Parliament; provided for the exercise by the Irish Parliament of complete control over finance, including customs and excise; and suggested the appointment of a commission to negotiate a trade, postal and customs union with Great Britain. These proposals represented a great departure from the principles of the Act of 1914 and an approximation to the Sinn Fein ideal of an independent Ireland. They were opposed by the Unionists both of the South and North. The former were, indeed, prepared to concede to the Irish Parliament control of excise; but the Ulstermen insisted on full control of finance being left to the Imperial Parliament. Mr. Hugh T. Barrie, chairman of the Ulster representatives, pointed out in a letter to Sir Horace Plunkett[1] that the difference which had brought matters "nearly to a dead-lock" rested on points of principle and not of detail. He urged that in matters of fiscal policy and economic life the interests of Ireland were inseparable from those of Great Britain, and that there could be no differentiation of taxation or customs barrier between countries which must continue to be so intimately associated. The doctrine of fiscal autonomy was more than "a symbol of political autonomy"—as Sir Horace had described it; it would, under a colonial form of government, separate the interests of Ireland from those of Great Britain and thus inevitably lead to the same goal as the Sinn Feiners desired to reach under a republic.[2] The practical independence of Ireland, under the Crown, would mean that, desiring to increase her industrial activities and with practically no raw material within herself, she would be cut adrift from the strongest commercial power in the world and have to rely on her own resources in the welter of economic trouble with which the world would be faced at the end of the war. Ulstermen refused to be divorced from the great industrial people with whom they had so much in common.

On this rock the Convention split. The final report of the sub-committee, presented on Nov. 21, stated that on the all-important fiscal question it had been impossible to find a basis of agreement. The grand committee equally failed; and the question was introduced in the Convention itself, which debated it from Dec. 18 to Jan. 24 without coming nearer to a decision, a compromise suggested by Lord Midleton being rejected by a combination of Nationalists and Ulstermen. The Convention was now in danger of breaking up without effecting anything, and on Jan. 21 the Prime Minister addressed a letter to Sir Horace Plunkett inviting a delegation from the Convention to go to London to discuss the crisis with the Cabinet, with a view to arriving at a solution. The invitation was accepted, but the resulting conferences were fruitless, and the problem was once more transferred to Dublin for the Convention to solve as best it might. The Prime Minister still hoped that substantial agreement might be reached; and on Feb. 21 he addressed a letter of appeal to Mr. Barrie, the terms of which left no doubt of his anxiety to effect an immediate settlement and of his readiness to do all in his power to promote it; and on the 25th he sent another letter, in almost identical language, to Sir Horace Plunkett.[3] No appeals and no arguments, however, could effect a compromise when interests and sentiments were in such diametrical opposition. On March 12 the Convention, despairing of reaching agreement, passed a compromise proposed by Lord Macdonnell to the effect that customs and excise should be under the control of the Imperial Parliament during the war, and thereafter until the question of such control had been considered and a decision arrived at by the Imperial Parliament, the decision to be taken not later than seven years after the conclusion of peace. The motion was carried, but only by a majority of four in a house of 72 members; the minority included all the Ulster representatives and a number of Nationalists. Three days later (March 15) Mr. Barrie moved an amendment providing for the exclusion of Ulster from the jurisdiction of the Irish Parliament. This was defeated by 52 to 19, the southern Unionists voting with the Nationalists against it. It marked, however, the definite withdrawal of the Ulster representatives from any appearance of compromise with the Nationalist principle, and the Statement of Conclusions reached by the Convention shows that they voted solidly against all proposals which involved recognition of the principle of setting up an Irish Parliament.[4]

*Proposed Constitution.*

The scheme, as ultimately accepted by a majority of the Convention on April 5 1918, provided for the establishment of a Parliament for the whole of Ireland, with an executive responsible to it. The Parliament was to consist of the King, a Senate, and a House of Commons, but the supreme power and authority of the Imperial Parliament over all persons and causes in Ireland was reserved. The Irish Parliament was to have a general power to make laws for Ireland, subject to certain reservations. Imperial matters—right of peace or war, army and navy, treaties and foreign relations, etc.—were specifically excluded from its competence. There were also to be certain restrictions imposed on its power in matters within its competence, mainly directed to safeguarding the liberties of the Protestant minority and the interests of existing Irish officers. To this end also the Convention accepted the principle that 40% of the membership of the House of Commons should be guaranteed to the Unionists, the nominated members to disappear in whole or in part after 15 years. Representation at Westminster was to continue, 42 members being elected by panels formed in each of the four provinces by members of the Irish House of Commons in that province, and a fifth composed of members nominated by the House of Commons. All branches of taxation, other than customs and excise, were to be under the control of the Irish Parliament. The question of customs and excise was to be postponed in accordance with the terms of Lord Macdonnell's motion already quoted.

The various sections of the Report had been carried by majorities varying from 51 to 18, to 38 to 34, and the Report itself was adopted by a vote of 44 to 29, several prominent Nationalists, including the Bishop of Raphoe, voting with the Ulster representatives in the minority. It was clear that on no points had that substantial agreement been reached which would alone have justified the Government in attempting a dangerous constitutional experiment in the midst of the war.[5]

*Failure of the Convention.*

In Ireland it was all but universally recognised that the Convention, for all the common love of country and mutual good-will between Irishmen of different creeds and parties which it had revealed, had been a failure. It belongs to the history of Ireland, but on the future development of that history it had, unhappily, no influence. It was outside the Convention that the fate of Ireland was being shaped. The truth is that the "atmosphere" provided for the Convention by the release of the Sinn

[2] Cf. with this 18 of the "Report of the undersigned Nationalists" attached to the *Report* of the chairman of the Convention, p. 38:—"Federation is not in view. Even if it were, and Ireland were still intent on retaining control of her customs, her sea boundary, and her distinct national character, economic interests would give her a claim in that respect which no member of a federation anywhere else can advance."

[3] The letter to Sir H. Plunkett is printed in the *Report*, p. 20.

[4] See *Report*, p. 24, and compare the division list, Appendix xvii.

[5] The Ulster Unionist delegates attached to the chairman's *Report* a protest of their own. They ascribed the failure of the Convention to the refusal of the Nationalist members to agree to a *modus vivendi* which would both maintain existing fiscal unity, guarantee protection for the Unionist minority, and ensure the safety of Irish industrial enterprises, "the vast proportion of which are situated in the N. E. counties of Ulster, and from which the bulk of the Irish revenue is derived" (p. 30).

Fein prisoners had been far from wholesome. The Sinn Fein organization had never been broken up, but it had languished because its "brains" were in prison. The sickness was now cured, and it at once displayed an astonishing vitality, Mr. De Valera, crowned with the double glory of his share in the rebellion and his victory in Clare, becoming its recognized leader.

While the Convention was continuing its more or less amicable discussions in the academic calm of Trinity College, Sinn Fein orators were touring the country inspiring increasing crowds of ignorant and excitable people with their own venom and their own views as to how Ireland was to find salvation. Their text, generally speaking, was the dictum of Parnell, uttered in 1883: "It is no use relying on the Government; it is no use relying on the Irish members; it is no use relying on the House of Commons. You must rely on your own determination, and if you are determined, I tell you, you have the game in your hands."[1] Their programme remained the same; to capture the parliamentary representation and the elected organs of local government; to boycott and supersede the royal courts and the officers of the law; to organize and arm a force capable of effective resistance to the forces of the Crown. The latter object was pursued with no attempt at disguise. On July 28 the Government issued a proclamation prohibiting the carrying of weapons, or of objects capable of being used as such, in public places. On the following day Mr. De Valera, after addressing an assembly of 10,000 people at Tullamore, reviewed 1,000 Irish Volunteers; and on the same day 100 men carrying hurleys[2] marched from Liberty Hall through Dublin to Terenure. On Aug. 5, the anniversary of Casement's execution, a vast concourse of people assembled at Tralee in county Kerry and went in procession to "Casement's fort." Sinn Fein tricolours were worn and waved, and it was noted that large numbers of Volunteers appeared in uniform.[3] From county Clare the police reported that De Valera's advice to the people to combine "to make English law impossible" had produced a complete condition of lawlessness, the supporters of the Nationalist candidate at the recent election being boycotted together with the police; from Tipperary, that Sinn Fein had become violent and menacing, especially in Thurles, and that the movement was being worked up in concerts, dances, club meetings, Gaelic athletic tournaments, lectures and public meetings; from Cork, that serious disturbances had broken out, including a cowardly attack on female munition workers.[4] A similar agitation, with similar results, was taking place in many other parts of Ireland. Already there were reports of attacks on police barracks, and in many places the drilling of Volunteers was being resumed. At the same time the Sinn Fein clubs, and in some cases the County Councils (*e.g.* Kerry, Aug. 26), were calling upon their Nationalist members to resign. The result of all this was advertised by another victory of Sinn Fein at the polls, at Kilkenny (Aug. 11).[5]

***De Valera's influence.***

It became absolutely necessary for the Government to take action, if any semblance of authority was to remain to it; on Aug. 14 prominent Sinn Feiners were arrested in every province of Ireland; and this was followed by the seizure of arms belonging to the Irish and National Volunteers. The prisoners, many of whom had taken an active part in the German plot of 1916, were sentenced under the Defence of the Realm Act to various terms of penal servitude or imprisonment. But the greatest care was taken not to interfere with the free expression of opinion, so long as this did not amount to incitement to illegal acts; and when meetings were proclaimed, which was comparatively rarely, it was always because, in the opinion of the police, they would lead to grave disorder. Throughout the year, and during the earlier months of 1918, De Valera and his lieutenants continued their agitation practically unchecked. Their cause was helped by an untoward event which occurred on Sept. 25—the death of Thomas Ashe as the result of forcible feeding in prison. For some time past Sinn Fein prisoners had been imitating the suffragette device of the "hunger strike," in order to secure their treatment as prisoners of war or political prisoners. Ashe, the hero of the Ashbourne affair, had been tried for murder and condemned to death by court-martial after the Easter week rebellion, but reprieved. Released by the general amnesty, he was rearrested on Aug. 14, and on the 20th was condemned to one year's hard labour for attempting to cause disaffection among the civil population. He went on hunger strike, was forcibly fed by the prison doctor in the ordinary execution of his duty, and died of heart failure as a result of the process. The affair created an immense sensation, and Sinn Fein exploited it to the full. The funeral of the latest martyr in Dublin was attended by a vast concourse of people; the coffin was draped in the Sinn Fein tricolour and escorted by Irish Volunteers in uniform and armed; the Lord Mayor of Dublin (Alderman O'Neill) and Dr. Walsh, Roman Catholic Archbishop of Dublin, sent their coaches to swell the cortège, while the Dublin Corporation adjourned for a week as a sign of sympathy and respect.

***Death of Thomas Ashe.***

For the Government, which during the inquest was loudly accused of deliberate murder, nothing could have been more unfortunate. On the 29th the authorities decided to modify the treatment of political prisoners; but the hunger strikes continued; the Government, afraid of the effect of forcible feeding, and as yet unwilling to allow the prisoners to take the consequences of their self-imposed deprivation, had recourse to the provisions of the "Cat-and-Mouse Act," under which prisoners on hunger strike could be released but were subject to rearrest when they had recovered their strength. The result in Ireland was to make imprisonment little more than a cheap advertisement, prisoners being released after a few days' abstention from food. By Nov. the situation had become so farcical that Sir John Ross, in the Land Judges' Court, declared that the government of Ireland had been abandoned. Yet even the feeble half-measures employed by the Chief Secretary, Mr. Duke, roused the opposition of the Nationalist members, who saw in obstructing the action of the Irish Executive the only surviving hope of retaining their weakening hold on the country. In reply to Mr. Redmond, who on Oct. 23 opened the attack on the Government in the House of Commons, Mr. Duke enlarged on the peril of the situation, pointing out that 200,000 young men were being enrolled in Ireland for the purpose of a new rebellion. Point was given to this by the news next day that the United States had frustrated an elaborate scheme for a new rising, with German aid, by the arrest of the Sinn Fein agent Liam Mellowes and Dr. Patrick MacCartan, Sinn Fein "ambassador" in America.

The forbearance of the Government was illustrated by the assembling on Oct. 25, in the Dublin Mansion House, of a Convention summoned by Sinn Fein to formulate a constitution for Ireland. This Convention, which claimed to represent 12,000 Sinn Fein clubs with 250,000 members, concluded with a public session on Oct. 27, when the Sinn Fein constitution was announced. The object of the organization was declared to be to secure the international recognition of Ireland as an independent Republic, and to "make use of any and every means available to render impotent the power of England to hold Ireland in subjection by military force or otherwise." Mr. De Valera was elected president, Mr. Arthur Griffith and Father Michael O'Flanagan vice-presidents, Messrs. Austin Stack and Darrell Figgis secretaries. "Departments," under "Ministers," were to be created for military organization, political organization, education and propaganda, foreign relations and finance. After the meeting a convention of Irish Volunteers was held in a large store in Dublin. At this meeting De Valera said that by proper organization and recruiting Sinn Fein would secure

***Sinn Fein Convention.***

[1] Quoted by Darrell Figgis in *Nationality*, Aug. 4 1917. He adds: "That is Sinn Fein!"

[2] Practically a hockey club. The *Daily News*, among others, ridiculed the prohibition to carry these "toys." It was with a hurley that Inspector Mills was murdered in Dublin.

[3] *Irish Times*, Aug. 7 1919.

[4] On Sept. 2 and 3 American sailors walking out with girls were mobbed and ill-treated by the Sinn Fein "Vigilance Committee."

[5] The figures were: Cosgrave (S. F.) 772; Magennis (Nat.) 392.

20,000 fighting volunteers, that the only hope of another rebellion with any chance of success lay in a German invasion of England and the landing of further arms in Ireland, but for that they must prepare. He further said:—

"That there would never be peace in Ireland till they got their independence. When the war was over England would be tottering. The Allies could not win. All nations at the Peace Conference would claim their right to the freedom of the seas, and Ireland was of such international importance in that respect that her claim must be admitted. They wanted an army to back their claim. . . ."

On Nov. 4 at Athy he delivered another speech, important as an index to Sinn Fein principles and methods. England, he urged, did not "desire another front," and therefore, if Ireland were armed, there would be no conscription. Turning to the attitude of the hierarchy, and possible action by the Vatican, he said that England would doubtless like such an intervention, but he claimed for priests in political matters full freedom, including that to join Sinn Fein.[1]

A bitter attack on Mr. Redmond[2] followed, and a stout assertion that Sinn Fein was "not afraid of Sir Edward Carson and his crew."

It is not surprising that the repetition of this sort of language should towards the end of the year have produced a situation with which the Government, hampered by the "atmospheric" theory of administration, were unable to cope. Disciplinary measures, even of a mild sort, had—according to the police reports—an instantaneously good effect; but discipline was all but impossible when the only available punishment, imprisonment, was rendered nugatory by the expedient of the hunger strike, and prisoners were released almost as soon as they were condemned.[3] The sword of justice, dropped from the nerveless hands of the legitimate administrators of the law, was grasped by Sinn Fein, which did not scruple to use "any and every means" to attain its end. Thus, even so early as this, the effective control of affairs in large parts of Ireland was passing out of the hands of the officers of the Crown. The process may be illustrated by one instance. In Dec., according to police reports from Clare, "Sinn Fein continued to rule the county, and persons who were not Sinn Feiners must show sympathy with the movement if they wished to live in peace with their neighbours"—in other words, if they wished to escape the terrible weapon of the boycott or worse.[4] That Sinn Fein was still in touch with Germany was proved when James Ruane, a local Sinn Fein leader, was arrested on Dec. 2 at Kiltimagh in county Mayo, when he was found in possession of two pamphlets printed in Germany and bearing the official impress, "Kriegsausschuss der Deutschen Industrie, Berlin."[5]

The beginning of 1918, which saw affairs in the Convention come to a crisis, saw also the development of grave disorders in large parts of the country. Through the south and west a flood of lawlessness was sweeping; in the counties of Clare, Sligo, Roscommon and Mayo the King's writ had virtually ceased to run. From Clare, especially, the police reported that during the first four months of the year there was "utter anarchy." There were huge cattle "drives," encouraged by the local clergy; illegal drilling was openly carried on; R.I.C. barracks were attacked; on three occasions small patrols of police were overwhelmed and their arms taken; telegraph wires were cut and roads blocked to hamper the movements of the police and troops. "It was not until a large force of soldiers were drafted in, and the county made a special military area[6] with very severe restrictions, that some sort of order was restored." Similar reports, though not so grave, came from other counties; in Galway and in Tipperary, as in Clare, there were numerous raids for arms on isolated country houses, carried out by bands of masked men; and Tipperary, where the police reported a "reign of terror," had to be declared a special military area so early as March 6. On the same day there were serious riots in Limerick.

On March 6, John Redmond died in London, and with him seemed to go the last hope of settling the Irish question on a basis of reasonable compromise. In him, indeed, it is said that the hope had died already, and that his death was hastened by the consciousness of the breakdown of his life's work. On Jan. 11 the Ulster Unionist Council had urged the Government to extend the Military Service Act to Ireland, but three days later, when the new bill was introduced in the House of Commons, Sir Auckland Geddes announced that this course would not be followed. This was a victory for the Irish Parliamentary party, and its reflex was seen in the results of the Irish by-elections, Nationalist candidates defeating Sinn Feiners in South Armagh (Feb. 2), at Waterford (March 23) and in East Tyrone (April 4).[7] The day following this latter election saw the last meeting of the Irish Convention; and the set-back to Sinn Fein seemed of favourable augury for some satisfactory outcome of its labours. But circumstances almost at once arose which again made any peaceful solution of the Irish question impossible.

*Death of John Redmond.*

The March offensive of the Germans, resulting in the pressing back of the British line with an immense loss of men and material, made it necessary for the Government to summon every possibly available man in Great Britain to the colours, the age limit being raised to 50. It was felt, however, that to call elderly men to arms in Great Britain while thousands of young men of military age in Ireland continued to be exempt would strain the patience of the British to breaking point; and when, on April 9, Mr. Lloyd George introduced the Man Power bill, he announced that he proposed to extend obligatory military service to Ireland on the same terms as to England. On the following day the second reading of the bill passed by 323 votes to 100, the clause extending it to Ireland being carried two days later by a slightly smaller majority.

*The Man Power Act. Extension to Ireland.*

The passing of this measure, which two years earlier would probably have been accepted in Ireland without serious demur, at once threw the whole country into fresh turmoil, which Mr. Lloyd George's undertaking to introduce a bill to give self-government to Ireland did nothing to allay. On March 12 Mr. John Dillon had been elected as Mr. Redmond's successor in the leadership of the Nationalist party. Under his auspices Nationalists and Sinn Feiners established a sort of temporary alliance, ominous of the ultimate fate of the Parliamentary party. On April 17, after the defeat of an amendment to exclude Ireland from the Man Power bill, the Nationalists left the House of Commons in a body and decided to transfer their deliberations to Dublin. On the 18th, the day on which the bill received the royal assent, a meeting to denounce it was held at the Mansion House, Dublin, and

[1] On Nov. 25 Cardinal Logue issued a pastoral condemning the agitation. Speaking at Roscommon, next day, De Valera refused to discuss it. The movement, he said, had two sides, destructive and constructive; the destructive side to destroy English misgovernment, and the constructive side to build up a self-respecting, self-reliant nation, a nation able to manage for itself, without looking abroad for help of any sort; and when the opportunity comes for producing Ireland's case before the world, then to ask those nations who are supposed to be fighting for small nationalities if they are not hypocrites. It was on that plea, he believed, that England went into the war; so far as England was concerned that plea was hypocrisy.

[2] These and similar attacks threatened to have unpleasant consequences, and while at Aughavanagh, in Wicklow, Mr. Redmond was protected by a police patrol.

[3] Between Nov. 15 and 21 102 hunger strikers were released from various prisons. From County Clare the police reported that "the arrests for illegal drilling in Nov. had a good effect until the release of the prisoners on hunger strike, which made matters worse." On the other hand they reported that in Dec. the cessation of arrests had made many give up drilling, as done out of mere bravado.

[4] As an indication of the spread of Sinn Fein it is interesting to note the great rise in the circulation of Sinn Fein organs. The *Irishman*, *e.g.*, which in Feb. 1916 had a circulation of only 1,692, had increased this in Nov. 1917 to nearly 15,000 weekly.

[5] *Documents rel. to Sinn Fein Movement*, p. 39.

[6] March 30.

[7] The figures were: S. Armagh—Donnelly (Nat.) 2,324; Dr. MacCartan (the Sinn Fein "ambassador" to the United States) 1,305; Richardson (Ind. Unionist) 40. Waterford—Capt. W. A. Redmond (Nat.) 1,242; Dr. White (S. F.) 764. E. Tyrone—Harbison (Nat.) 1,802; Sean Milroy (S. F.) 1,222.

was attended by the leaders of the Nationalists, of Sinn Fein and of the various labour groups; it was noted that Mr. Dillon referred to Mr. De Valera and Mr. Tom Johnson, the Labour leader,[1] as his "colleagues." On the following day they issued a joint statement protesting against the claim of the Imperial Parliament to impose "conscription" on Ireland, and commissioned the Lord Mayor (Alderman O'Neill) to proceed to the United States in order to lay it before President Wilson.[2] On the 20th Mr. Dillon presided over a meeting of the Nationalist party in Dublin, at which it was decided to cease attendance at Westminster and to remain in Ireland for the purpose of defeating conscription. On the 23rd the Transport Workers' Union carried out a one day's strike in all parts of Ireland, except in the N. E. counties of Ulster, as a protest against conscription. But by far the most serious effect was produced by the action of the Roman Catholic hierarchy. On April 18, the day on which the first anti-conscription conference was held at the Mansion House, the bishops had met at Maynooth, under the presidency of Cardinal Logue, and decided to throw the whole weight of the Church against the Act. They drew up a form of pledge to resist conscription, directing it to be administered by the priests after Mass to all the faithful, and every Roman Catholic parish church in Ireland was soon turned into an active centre of political resistance. In vain loyal Catholics protested, while Protestants were not reassured by the theological arguments by which the learned Father Peter Finlay, S.J., sought to justify the incursion of the hierarchy into politics:—

"No doubt," he wrote, "political consequences of the first magnitude have followed on the action of the bishops; but the issue laid before them was religious and moral, not political. . . . Laws of Parliament may be just or unjust, binding or not binding upon conscience; and when we Catholics doubt their justice and binding force, we appeal, not to politicians or to civil court for guidance, but to the Catholic bishops."[3]

From the point of view of Irish Protestants this justification of the attitude of the Catholic hierarchy was even more disconcerting than the attitude itself. They had seen, from recent cases of the papal "Motu Proprio" *Quantavis diligentia* and the *Ne temere* decree, how completely the Roman Church adhered to the most extreme claims to jurisdiction put forward by the mediaeval popes. They knew that the principle of toleration had been anathematized by three popes during the 19th century, and they naturally asked themselves what use parliamentary safeguards for their religious liberties would be under Home Rule, if the laws of the Irish Parliament were to be subject to the "moral" censorship of the Roman Catholic hierarchy with an ultimate appeal to Rome. The whole "conscription" controversy, indeed, still further increased the unhappy national cleavage represented by religion; for while the Roman Catholic clergy were organizing their forces to resist, the Protestant Archbishops of Armagh and Dublin sent out an "urgent appeal" to the young men of the Church of Ireland to join the colours, hoping that compulsory service would be "cheerfully accepted," while the Moderator and General Assembly of the Presbyterian Church issued a similar appeal.

***Split in the Unionist Alliance.***

Unfortunately for the Protestants, at this crisis in their fate, their own ranks were broken by an angry controversy as to the attitude in the Convention of the five delegates appointed by the general council of the Irish Unionist Alliance. These delegates, under the leadership of Lord Midleton, had interpreted their mandate as meaning that, in the interests of the Empire, they were to arrive at some compromise with the Nationalists in the matter of Home Rule; and, while affirming their own unshaken belief in the system of the Union, they had accepted the principle of Irish self-government and voted on many occasions with the Nationalists against the Ulster Unionist delegates. On Jan. 1 1918 Lord Midleton made his first report to the executive committee of the Alliance, and this was approved by 41 votes to four. It was soon found, however, that the executive committee, which had not been renewed since the beginning of the war, did not in this matter represent the opinions of the great majority in the Alliance. A Southern Unionist Committee was at once formed under the chairmanship of Mr. Richard Bagwell, the eminent historian of Ireland, and on March 4 issued a "Call to Unionists":—

> The circumstances of the present time demand that all true Unionists, especially outside Ulster, should reiterate, with no uncertain voice, their conviction that in the maintenance of the legislative union between Great Britain and Ireland, and in the firm, just, and impartial administration of the law, lies the only hope for the future of our country and security of the Empire.

It pointed out that the present revolutionary movement, which was "gaining strength day by day," aimed—like all preceding ones—at complete separation; it urged that the true policy to be pursued towards Ireland was, in combination with firm and just government, the development of her material resources and the removal of agfarian discontent by the completion of land purchase; and it ended by stating that "the burdens and obligations of the war, already imposed on the rest of the United Kingdom should be shared by Ireland."

This manifesto led to a heated controversy in the press. It had, however, no effect on Lord Midleton and his followers in the Convention, who voted in the majority for the Report. The Southern Unionist Committee at once issued a criticism of the Report, pointing out that the delegates of the Alliance had publicly declared for Home Rule in its most drastic form, and calling on Unionists to "stand firm." That this attitude represented the dominant view in the Alliance was proved when, at a meeting of the General Council held on June 7, 16 out of 20 members elected to fill vacancies on the executive committee were nominees of the Southern Unionist Committee. Lord Midleton's supporters were, however, still in the majority on the executive committee, and it became necessary to amend the constitution so as to make this representative of the views of the General Committee. This was done at a special meeting summoned by the Southern Unionist Committee on Jan. 24 1919. Lord Midleton proposed at this meeting to exclude the northern members from its deliberations, should the question of partition arise. This motion was lost by an overwhelming majority; the amendments to the constitution were carried by 400 votes to 62; and at the subsequent elections to the executive committee the 40 nominees of the Southern Unionists Committee were elected by large majorities. Lord Midleton and his friends, taking this as a vote of censure, thereupon left the Alliance, and formed the separate group known as the "Anti-Partition League." The Unionist Alliance was thus reëstablished on the basis of uncompromising adherence to the Union, with branches in every county in Ireland, including Ulster. It continued to work in close touch with the Ulster Unionist Council, which represented the exclusive interests of Unionists in the six counties. From the Unionist point of view, however, the schism was disastrous; for the seceding members of the Alliance, though few in numbers, included many Irish peers of great influence in the House of Lords, and their defection greatly crippled the resources of the Alliance, which was left practically without representation in Parliament.

Meanwhile excitement among the people had been growing apace. In every Roman Catholic church in Ireland the people were signing the anti-conscription pledge, and to refuse to do so called for more than ordinary courage. It was clear that a change of system was necessary in the administration if the Crown was to preserve any shadow of authority in the country. The change was heralded on May 1 by the retirement of Mr. Duke,[4] and the appointment of Mr. Edward Shortt, K.C., as

[1] An Englishman, formerly a commercial traveller.

[2] It was believed that the Government would create another occasion for disputery by refusing to give the Lord Mayor a passport. The Government, however, consented to issue passports, but made it a condition that the document to be presented to the President should be first shown to the Lord Lieutenant. To this the Irish leaders refused to agree, and it was made the excuse for abandoning the whole enterprise. The Cork Corporation had also protested, and appealed to President Wilson (April 12).

[3] Letter to the *Irish Times*, May 14 1918, afterwards amplified in an article in the Jesuit Sinn Fein quarterly *Studies*.

[4] He became a Lord Justice of Appeal.

Chief Secretary. On the 6th it was announced that the lord-lieutenancy, in succession to Lord Wimborne, had been accepted by Visct. French of Ypres; and on the 11th the new Viceroy and Chief Secretary arrived in Dublin. Sir Brian Mahon had resigned the Irish command two days earlier. On June 5 Sir James Campbell succeeded the Nationalist Sir Ignatius O'Brien—created Lord Shandon—as Lord Chancellor. The spirit of the new order was symbolized by the changes at the viceregal lodge, where Lord Wimborne had maintained traditions of splendour. For this was now substituted the simple discipline of a military household.

*Lord French, Viceroy.*

The new administration was not slow in getting to work. On May 17 De Valera was arrested, a number of compromising documents being found on his person.[1] Next day, a proclamation announced the discovery of a dangerous German intrigue.[2] On the 20th a large number of Sinn Fein leaders were arrested, including Arthur Griffith, Count Plunkett, Countess Markievicz, John Milroy and Herbert Mellowes. These were all deported to England, and further deportations followed on the 22nd and 24th. On the 21st, at a meeting of the Anti-Conscription Committee at the Dublin Mansion House, Messrs. Dillon, Tim Healy, William O'Brien, Joseph Devlin and Tom Johnson combined in denouncing the deportations as "a wicked plot of English politicians," and on June 3 the Dublin Corporation followed their example. On May 25 the Council of the National University—a government institution largely supported by the British taxpayer—advertised its views by reappointing Mr. John MacNeill to the professorial chair which he had forfeited owing to his share in the rebellion.[3] Meanwhile the Military Service Act had not been put in force in Ireland, and on June 3 the Lord Lieutenant issued a proclamation calling for voluntary recruits, announcing that in the event of a satisfactory response the Act would not be applied, and promising grants of land to men who had served in the war. An active recruiting campaign was at once begun under the direction of a committee consisting largely of Nationalists who had served at the front, including Col. Lynch, who had been condemned to death for fighting with the Boers against the British in the Boer War. The response to this appeal, however, was slow. The meetings were exposed to an organized interruption by Sinn Feiners, and this sometimes developed into violence, necessitating the intervention of the police.[4] By Nov. 12, when recruiting was stopped after the Armistice, of some 150,000 men of military age only 11,301 had joined the colours. The only practical outcome of the campaign, conducted as it was by Nationalists with a loud appeal to President Wilson's programme, was to commit the Government irrevocably in the eyes of the Irish people to the principle of "self-determination."

Evidence of the revolutionary activities of Sinn Fein continued to reach the Government, and 40,000 rounds of ammunition, concealed in corn sacks from the North, were seized in Dublin on June 24. The arrest of a German agent named Dowling (alias O'Brien) in April, and his trial in London in July, pointed the moral of these military preparations; and on July 3 the Sinn Fein organization, Sinn Fein clubs, the Irish Volunteers, the Cumann na mBan (Women's Association) and the Gaelic League, were proclaimed as dangerous associations under the Defence of the Realm Act. Next day the whole western sea-board of Ireland was declared a military area under the same Act. From all parts of the south and west came reports of raids for arms by masked men on isolated country houses. In Wexford, in Wicklow, in Longford, in King's county, as well as in such perennially lawless counties as Clare and Tipperary, the charges of the judges to the grand juries, at the summer assizes, referred to a dangerous state of things "which could not go on in any civilized country"—outrages, intimidation, boycotting. The grand jury of county Clare handed in a resolution approving of the steps taken by the Government "to restore the rudimentary elements of law and order," and stating their opinion that "the retention of a competent military authority, together with sufficient forces, was absolutely necessary to the continued maintenance of the peace of the county." Such, however, was not the opinion of Mr. John Dillon and the Nationalist members, who after an absence of three months had returned to Parliament on July 23. On the 29th Mr. Dillon moved that the Irish policy of the Government was inconsistent with the principles for which the Allies were fighting, and in the course of a violent speech spoke of Ireland as "under the unfettered tyranny of military government" and suggested that President Wilson should be called in to settle the question. In his reply Mr. Shortt, the Chief Secretary, threw the blame for the condition of Ireland on the Nationalists, who were trying to outbid the Sinn Feiners in violence instead of restraining them.

*Proclamation of Sinn Fein.*

This was truer than his sanguine assertion that things in Ireland had improved. It had early become apparent that the union of all the Nationalist elements on the common ground of opposition to conscription had been more apparent than real, and that its most obvious outcome was a formidable accession of prestige and power to Sinn Fein. It had persuaded Mr. Dillon to accept, at least for the time, its policy of abstaining from attendance at Westminster; it had secured the control of the anti-conscription funds raised by the Mansion House committee for a Sinn Fein organization; and it had made not the slightest concession in return. The full import of this was revealed during the contest which preceded the election for East Cavan on June 21, and its result. Over the question of a candidate the Nationalist party and Sinn Fein were "at one another's throats." It was suggested that this seat, which had been held by a Nationalist, should be left to a Sinn Feiner, for the sake of preserving "national unity." But on May 3 Mr. Dillon had declared that "if the spirit exhibited by the leaders of Sinn Fein in making an attempt to capture the seat were to prevail, national unity would be obviously impossible."[5] The attempt did prevail, Mr. J. F. O'Hanlon, the candidate of the United Irish League and the Ancient Order of Hibernians, being soundly beaten by Mr. Arthur Griffith.[6]

In the autumn, shortly before the Armistice and the dissolution of Parliament which followed, Mr. Dillon made another effort to retrieve the falling fortunes of his party. On Nov. 4 Mr. T. P. O'Connor moved in the House of Commons that the Irish question should be taken up at the Peace Conference and settled in accordance with President Wilson's principle of "self-determination." This proposal, though it had the support of Mr. Asquith, was naturally rejected. In the course of his speech in opposition to the motion Mr. Shortt challenged the Nationalists to say what settlement they wanted, and drew from Mr. Dillon the admission that he contemplated the coercion of Ulster. The Chief Secretary also took occasion to draw attention to conditions in Ireland, which he painted in gloomy colours contrasting oddly with his optimistic picture of July. All the materials for an armed rising were prepared, he said, and only the week before the armed forces of the Crown had captured at the headquarters of the Irish Republican Brotherhood enough explosives to blow up all Dublin and Belfast. On Nov. 28, immediately after the dissolution of Parliament, Mr. Lloyd George and Mr. Bonar Law, on behalf of the Coalition Liberals, and the Coalition Unionists respectively, issued a joint manifesto on the Irish question:—

*Coalition Policy.*

[1] They included an elaborate scheme for the military organization of Ireland, based on the principle of compulsory service, when the country should have secured its independence. See *Documents* (Cmd. 1108), *cit.* Appendix A (1), pp. 47 ff.

[2] *ib.*, pp. 41 ff.

[3] It is of interest to note, as illustrating the attitude of the Government, that, in common with the other professors of this university who ranked as Government officials, Mr. MacNeill subsequently received a "war bonus" of £200 a year from the Government.

[4] The uncertainty of opinion at this time may be illustrated by the fact that while on July 31 the Galway County Council refused to hear Col. Lynch and Capt. Stephen Gwynn on behalf of the recruiting council, on the next day the Galway Urban Council gave them a sympathetic hearing.

[5] At Bailieborough, E. Cavan. (*Irish Times*, May 3.)

[6] The figures were: Griffith (S.F.) 3,785; O'Hanlon (Nat.) 2,581.

Ireland is unhappily rent by contending forces, and the main body of Irish opinion has seldom been more inflamed or less disposed to compromise than at the present moment. So long as the Irish question remains unsettled, there can be no political peace either in the United Kingdom or in the Empire, and we regard it as a first object in British statesmanship to explore all practical paths towards the settlement of this grave and difficult question, on the basis of self-government. But there are two paths which are closed—the one leading to a complete severance of Ireland from the British Empire, and the other the forcible submission of the six counties of Ulster to a Home Rule Parliament against their will.

Thus the Unionist party, after 30 years' resistance, surrendered to the principle of Home Rule. The surrender was perhaps justified, from the point of view of party tactics, by the political situation after the war. In Ireland, however, its effect was not reassuring. It did not reconcile the Nationalists, still less Sinn Fein, to what remained of the Union; among the Unionists of the South it strained the ties of sentiment connecting them with Great Britain almost to breaking point.

The general election under the new franchise, which practically amounted to universal suffrage, was held on Dec. 14 1918. Save in Ulster and in one or two constituencies in Dublin, the struggle was wholly between the Nationalist party and Sinn Fein,[1] and in this contest Sinn Fein was bound to win. The Nationalist party was disorganized, and its funds all but exhausted. The Sinn Fein leaders, on the other hand, had had plenty of time to perfect their organization after their release in 1917, and the easy conditions of their internment had made it possible to direct it even after their rearrest. Irish-America, too, having taken up their cause, supplied them with plentiful funds. All the conditions, therefore, favoured them. Owing to the state of the country, no police were available for maintaining order. Personation was rife—the dead voted in large numbers, while known opponents of Sinn Fein were warned not to vote if they did not wish to be dead; and since the polling clerks were almost exclusively Sinn Fein, the electors believed, rightly or wrongly, that their voting-papers would be examined and they themselves marked. The result was that there was a vast number of abstentions.[2] All this, in addition to the undoubted swing-round of opinion in the direction of Sinn Fein, secured for the Republicans a sweeping victory. John Dillon himself was rejected, and the Nationalist party, which had crumbled under his leadership, was all but wiped out, retaining only six seats out of 68;[3] the Independent Nationalists (O'Brienites) vanished altogether; Sinn Fein captured 73 out of a total of 105 seats. The Unionists improved their position; before the election they had returned 18 members, they now returned 26, and the 400,000 Protestants of the South were actually represented in the new Parliament by three members—two for Trinity College and one for S. Dublin.

*The General Election.*

The victorious group assumed the title of the Irish Republican party, and styled themselves not M.P., but F.D.E. (*Feisire Dail Eireann, i.e.* members of the Assembly of Ireland). On Jan. 8 1919 they held their first meeting in the Dublin Mansion House, under the presidency of Count Plunkett, and on the 21st the first formal meeting of Dail Eireann[4] was held in the same place. The proceedings were opened with prayer by Father O'Flanagan. Mr. Cathal Brugha (Charles Burgess) was then elected speaker, and a solemn Declaration of Independence was read in English, Gaelic and French, the 29 members present rising and subscribing to it in a body. The proceedings closed with the nomination of Count Plunkett, Mr. Arthur Griffith and Mr. De Valera as "delegates to the Peace Conference." This meeting was public. On the following day a private session was held at which Mr. De Valera was elected "President of the Irish Republic," and a ministry was established, with departments for finance, home affairs, foreign affairs and defence. Among the "ministers" was the redoubtable Michael Collins,[5] who as head of the "War Office" was later to organize the reign of terror.

*Dail Eireann.*

That an opposition Parliament should have been allowed to debate openly, and to set up an opposition Government, in a country under "martial law," may well surprise those who judge events in Ireland by the universal experience of other countries, and the spectacle of the metropolitan police guarding the peace of a rebel assembly would have yet more surprised them. In order to account for this singular phenomenon, and much else that happened during the time of troubles to come, it is necessary to explain the powers possessed by the Irish Government and the principles on which these powers were exercised. Ireland had not been put under martial law in the sense in which the South was after the Civil War in the United States.[6] The Defence of the Realm Act, which gave large powers to the Government to deal more or less summarily with persons dangerous to the State, was a temporary war measure common to the whole United Kingdom, and its operation was very jealously safeguarded. In addition to this, however, the Government had a reserve weapon in the Criminal Law and Procedure (Ireland) Act of 1887, but nearly all the clauses of this Act required a proclamation of the lord lieutenant in council before they came into force. The principle followed was to use these powers only in cases of grave necessity, so as to interfere as little as possible with the ordinary life of the country, and to apply them only temporarily and to certain disturbed areas. Meetings were only interfered with when, in the opinion of the police, they were likely to lead to grave breaches of the peace, and the ban at times fell on Orange demonstrations as well as on those of Sinn Fein. Thus the murder on Jan. 21 1919 of Constable MacDonnell—the first indication of a campaign which was to reach terrible proportions—was followed on the 28th by the proclamation under the Defence of the Realm Act of S. Tipperary as a "military area"; the murder of Mr. J. C. Milling, a resident magistrate, on March 31, led to Westport being proclaimed; the murder of Constable O'Brien and the wounding of several others, during the rescue of a Sinn Fein prisoner from Limerick workhouse infirmary on April 6, led to the proclamation of the district of Limerick.[7]

*Policy of Irish Government.*

The same policy was pursued, during the greater part of the year, towards the various revolutionary associations. They were allowed to carry on their propaganda, but whenever and wherever this led, or threatened to lead, to serious breaches of the peace they were proclaimed. Thus after a series of outrages, including a bomb attack on a police hut (July 21), the ambushing and murder of a constable (Aug. 6), and the murder of a boy of 15 (Aug. 15), Sinn Fein "and kindred bodies" were proclaimed in county Clare. On Sept. 10 they were suppressed in the county and borough of Cork, and on the same date Tipperary, Limerick, Clare and the county and borough of Dublin were proclaimed under sec. 1 of the Crimes Act (1887). All these proclamations were the result of definite outrages, which showed an alarming tendency to increase as

[1] At the suggestion of Cardinal Logue, who pointed out the danger of losing seats to "the enemy," the Sinn Feiners and Nationalists agreed not to stand against each other in certain Ulster constituencies, the Cardinal acting as arbitrator in their apportionment.

[2] "The only totals that can be estimated are those of the seats where a contest took place, and where Sinn Fein was admittedly polled to the last man. Yet in those seats, with a total electorate of over 1,452,000 voters, Sinn Fein polled only 480,000 votes—less than one-third" (*The Times*, Jan. 17 1919).

[3] Mr. Joseph Devlin held his seat in East Belfast, and Major Redmond his father's constituency in Waterford.

[4] Pronounced dahl eerahn.

[5] He had been a junior clerk in the Post Office.

[6] When on May 1, in the debate on the Budget, Mr. Joseph Devlin denied the moral right of the Government to tax Ireland, on the ground that martial law had been substituted for the Constitution, he was merely indulging in the usual wild exaggeration.

[7] The prisoner, R. J. Byrne, condemned to a year's imprisonment, had gone on hunger strike and been removed to the infirmary. During visiting hours 30 armed men, who had mixed with the visitors, suddenly fell with bludgeons and revolvers on the five policemen guarding the prisoner; Byrne himself seized Constable Spillane from behind round the waist, while others shot and bludgeoned him. The constable, however, succeeded in drawing his revolver and shooting Byrne under his arm. The Sinn Feiners got away with the prisoner, but he was mortally wounded. Some of the rescuers were traced to county Clare and arrested.

the year went on, though as yet they were confined to a number of more or less limited areas in the South and West.

On Jan. 25 the situation was further complicated by a great strike of the Belfast shipyards workers; but this had nothing to do with politics, and was settled on Feb. 19. More significant of political undercurrents was the attack by Mr. Joseph Devlin, in the House of Commons (March 4), on the Belfast Harbour bill, the rejection of which he moved on the ground that, under the actual franchise, no Catholic was ever elected on the Board of Commissioners. Asked what religion had to do with this, Mr. Devlin replied, "Religion, or irreligion, has everything to do with everything in Belfast."[1]

*Belfast Strike.*

Meanwhile the result of the general election was leading to certain developments of opinion in the South, which are historically more important rather for the influence they exerted outside Ireland than within it. On Jan. 24 occurred the split in the Unionist party already mentioned, the Anti-Partition League, under the leadership of Lord Midleton, supporting a moderate form of Home Rule for all Ireland. On the same day was established, under the chairmanship of Capt. Stephen Gwynn,[2] the Irish Centre party, which advocated self-government on the Dominion models for a united Ireland within the Empire. This subsequently developed into the Irish Dominion League, of which the secretary and moving spirit was Capt. Henry Harrison, (b. 1867), who in early life, though coming of a well-known north of Ireland family, had cast his lot in with Parnell, becoming Nationalist M.P. for mid-Tipperary (1888–1892), and during the war, having obtained a commission in the Royal Irish Regiment, had won the Military Cross and Bar by distinguished gallantry on the western front. This organization was supported by a certain number of former Unionists as well as Home Rulers of the less extreme type, including Sir Horace Plunkett and Gen. Sir Hubert Gough, and had for its chief organ the *Irish Statesman*, a high-class weekly. Its effect on public opinion was, however, relatively small in Ireland. Its main success was in encouraging Lord Northcliffe to use his powerful influence in the English press in favour of a full measure of Irish self-government. During the year 1919 the columns of the newspapers, both in Ireland and Great Britain, were filled with the most varied suggestions for a solution of the problem,[3] but in Ireland itself mass opinion seemed to have become stereotyped, under one influence or another. With the internment of the leading Sinn Fein orators, the flood of eloquence, punctuated with revolver shots, which enlivened the first half of 1918, had stopped, and Ireland was divided into two camps, by no means silent, but more concerned with acts than arguments. In the North, though no attempt was made to revive the Volunteer force, the Ulstermen remained as determined as ever, and they made full use of the tactical advantage given them by the refusal of the Sinn Fein M.P.'s to attend at Westminster. In the South Dail Eireann claimed the undivided allegiance of Irishmen, and enforced this claim by penalties which, since they were ruthlessly applied, tended more and more to make it effective.

*New Party Groups.*

The prestige of Dail Eireann in Ireland was increased by American support. The proclamation by President Wilson of the principle of "self-determination" as the basis of the coming peace treaty, and its acceptance by the other Powers, gave Sinn Fein a lever which it was not slow to use; and the President himself, before the experience of a month or two in Europe had taught him prudence, had held out hopes that the Irish question might be raised at the Peace Conference. To the Sinn Feiners, at a very critical period, this hope seemed about to be realized when it was announced that Mr. Lloyd George, then in Paris, had authorized the issue of passports to a deputation of three American-Irish gentlemen whose ostensible mission was to report to President Wilson on conditions in Ireland, but whose principal aim was to confer with "President" De Valera on the question of securing international recognition of the Irish Republic at the Peace Conference. These envoys, who appeared to be invested with a quasi-official status from the Peace Conference, arrived in Dublin on May 3, and on the 9th were welcomed by Dail Eireann in special session. On the 12th they left for Paris, to prepare their report and lay it before President Wilson. The nature of this report could hardly be doubtful. The three American "commissioners," Messrs. Frank P. Walsh, Edward F. Dunne and Michael J. Ryan, were closely associated with the Clan-na-Gael and other extremist American-Irish organizations, the first named being chairman of the "American Commission on Irish Independence." It is not surprising then that an eight days' stay in Ireland sufficed to supply them with the most amazing stories of English "atrocities" and of English misgovernment and misbehaviour generally, which they proceeded to present to the American people and the American Congress as facts proved by unimpeachable evidence.[4] But their efforts to persuade President Wilson to champion the cause of Irish independence at the Conference were vain, and on May 31 the American Peace Delegation definitely refused to request the Conference to receive "the representatives of the so-called Irish Republic."[5] In vain they pointed out, in a personal interview with President Wilson, that he himself had stated at the plenary session of the Conference on Jan. 25 that among the instructions of the American delegates, of which "they would not abate one jot," was that of seeing "that every people in the world shall choose its own master."[6] The President had realized by this time that, in loudly championing the principle of "self-determination," he had brought to Europe not peace but a sword. "You have touched on the great metaphysical tragedy of to-day," he said, "my words have raised hopes in the hearts of millions of people. . . . When I gave utterance to those words, I said them without the knowledge that nationalities existed which are coming to us day by day."[7]

*America and Ireland.*

Disappointed in their hopes of obtaining satisfaction from the Peace Conference, the Sinn Feiners determined to use their wide-spread organization in an attempt to wreck its work, and especially the League of Nations, which they had supported so long as they believed that independent Ireland would be represented in its Assembly. To this end an intensive propaganda campaign was set on foot in the United States. On Feb. 4. Mr. De Valera had succeeded, with two others, in escaping from Lincoln gaol; and the release of all interned Sinn Fein prisoners early in March, which regularized his position, enabled him to receive the American delegates in Dublin. After the breakdown of the negotiation at Paris, the "President" decided

[2] Son of the Rev. John Gwynn, D.D., Professor in Dublin University and senior fellow of Trinity, b. 1864. He was Nationalist member for Galway city from 1906 to 1918, enlisted in Jan. 1915, and obtained a commission in April, and served in France till 1917, when he was nominated by the Government as a member of the Irish Convention. He was a well-known writer.

[3] The more important of these are noted under their dates in the "Diurnal" given in *Notes from Ireland* (Ir. Un. All).

[4] "Much of the detailed evidence of atrocities committed against women prisoners in Ireland was furnished us by Countess Markievicz." This was written by Messrs. Walsh and Dunne in a letter to Mr. Lloyd George, dated Paris June 19 1919 (see 66th Congress, 1st Session, Senate Document 106, p. 817). The report of evidence given by the three envoys, with others, before the Foreign Relations Committee of the Senate is given *verbatim* in the Document. The value of this evidence may perhaps be gauged by one or two quotations. "When the Irish get together, north and south, they always agree" (p. 835). "Ireland is the most law-abiding country on the face of the earth" (p. 835). Liberty Hall is the headquarters of "the most conservative labor organization in the world" (p. 853). "England allows no ship to come trans-Atlantic to her (Ireland's) ports" (p. 828). "There is no religious question in the Irish movement" (p. 859). "Mercenary Gurkhas are imported to police Ireland" (p. 906).

to transfer his activities to the United States, which he succeeded in reaching in disguise. The agitation conducted by him in the United States belongs to the history of Ireland only in so far as it reacted upon it. The reaction was, of course, great. Sinn Fein was encouraged by the sympathy with its views manifested by large sections of the American people, culminating in the amazing action of the Foreign Relations Committee of the Senate in adopting the 15th reservation to the Covenant of the League of Nations, which would have committed the United States not only to the support of Irish independence but to that of the principle of self-determination generally. It was helped in yet more practical fashion by the response to the invitation issued in Sept. by Dail Eireann to subscribe to a loan guaranteed by the Irish Republic.

The organization of the terror in Ireland proceeded apace during the year 1919. The Irish Republican army (I. R. A.) was supplied with arms, partly by numerous raids on private houses, partly by the overwhelming of small parties of police and soldiers, and increasingly as time went on by shipments from the United States and elsewhere, which on a coast so wild and indented as that of Ireland there was little difficulty in smuggling in. Illegal drilling continued, and occasionally led to fights with the police, as at Kilrush, in W. Clare, on April 15. But the most effective weapon was the boycott. It had early been applied against those who had dared to vote against Mr. De Valera in E. Clare; at the "President's" request it was now to be applied universally to the police. Before Sinn Fein brought its blessings to Ireland, the Royal Irish Constabulary had been friends of every one. The service was exceedingly popular, there being often a hundred applications for one vacancy in the ranks. It was an armed and disciplined force, it is true, but in so wild and lawless a country as much of Ireland is, this was as necessary as the arming of the sheriffs in the western states of America. The force, moreover, was wholly manned by Irishmen, drawn for the most part from the ranks of the Catholic peasantry. These men very rarely used their arms. Their main duties consisted in checking ordinary crime, in preventing the illegal distillation of *potheen*, in protecting boycotted persons, and in saving the tails of "unpopular" farmers' cattle from the knives of their neighbours. They were debarred from voting or taking any other part in politics. Their functions in this respect were limited to trying to keep the peace between the contending factions, and they never intervened in debates until the champions of rival ideals had exhausted their armoury of abuse and, as is the way in Ireland, continued the argument with weapons more or less lethal. These men, whose courage and faithfulness to their trust had been so often proved, were now to be treated as pariahs and outcasts. On April 26 the executive committee of Cumann na mBan, the quasi-military Sinn Fein women's organization, issued instructions to its members not to be in company with nor to speak to a policeman, not even to occupy the same bench in church.[1] This might have been borne with philosophy; but an economic was added to a social boycott, and in many districts no tradesman or farmer dared to supply the police or their families with the very necessaries of life. In view of this, and of the campaign of wholesale murder to which they were presently subjected, it is perhaps not surprising that, after many months, the discipline of the force suffered, and its members occasionally took the law into their own hands.[2] The first "reprisals," however, were the work not of the police but of soldiers. On Sept. 7 at Fermoy, in Cork, a small party of soldiers leaving Mass were attacked by armed men on the steps of the church, one being killed and three wounded, the assailants making off in a motor with their rifles. The coroner's jury returned an open verdict, which so enraged the soldiers that in the evening they paraded the town and wrecked the shops of the tradesmen who had acted on the jury.

*Beginning of the Terror.*

Speaking at Glasgow on Sept. 1 Mr. Joseph Devlin said that Ireland had never "been more prosperous."[3] It had also rarely been more disturbed; and at Belfast on Sept. 11 Lord French declared that to restore order the Government would, if necessary, use the most drastic means. On the following day Dail Eireann was at last proclaimed as a dangerous association, and extensive military raids on Sinn Fein centres were carried out everywhere, in a systematic search for arms and seditious literature. During the month, also, a considerable number of Sinn Fein newspapers were suppressed in Dublin and the provinces. On the 22nd the seriousness of the situation was advertised by the arming of the constabulary with hand-grenades. Outrages, however, including several brutal murders,[4] continued and were followed by further proclamations and arrests. The arrests were followed in their turn by hunger strikes, and the prisoners continued to be released. Matters became worse in Nov.; systematic attacks on police barracks now became frequent; raids for arms continued, including one on the American steamship "Pensacola" at Cork (Nov. 5); on the 10th and 11th there were serious riots in Cork city; and on the 19th a new precedent was set by the burning down of the petty sessions court at Liscarroll, county Cork. In these circumstances the Government found it necessary to take additional powers. On Oct. 16 the city and county of Dublin had been proclaimed under the Crimes Act; on Nov. 13 the proclamation was extended to considerable areas of the country; on the 24th the Government announced in Parliament that hunger strikers would no longer be released, but must, "if they would not take their food, take the consequences"; and on the 27th the Sinn Fein organization, the Sinn Fein clubs, Cumann na mBan, etc., which had been proclaimed in Dublin on Oct. 16, were banned by proclamation in all Ireland.

Meanwhile abortive efforts had been made to arrive at an accommodation, Lord Southborough's[5] offer of his services to this end (Oct. 30) being contemptuously rejected by Mr. Arthur Griffith in the name of Sinn Fein. The situation was not improved by the issue (Nov. 20) of the report of the Irish Dominion League, which advertised the tendency of the "moderate" elements towards Sinn Fein; by the declaration of Sir Horace Plunkett that "civil management must be substituted for Prussian militarism";[6] and by his denunciation of the proclamation of Sinn Fein. The endorsement of this attitude by an influential section of the British press merely persuaded the Sinn Feiners that their policy of violence was on the eve of success, and that it only needed to be accentuated to make success certain. The month of Dec. accordingly saw a great increase in the number of outrages, which gave evidence also of increasing organization. All Dublin was horror-stricken by the murder on Dec. 1 of Detective-Sergeant Barton, a very popular officer, which was carried out in a populous thoroughfare in the heart of the city. It was the beginning of the terror which was to dominate the country during many months to come. The nature of this terror may be understood by the fact that when, on the 19th, a school-teacher named Blanchfield was murdered near Kinsale, the body lay for hours where it fell, as none of the villagers dared to touch it.[7] On the 20th a murderous attack was made on Lord French, the Lord Lieu-

*Organization of the Sinn Fein Terror.*

[1] The following diatribe against the police was circulated at the same time. It was headed "Aceldama" (the field of blood).

> For money their hands are dipped in the blood of their people . . .
> They are the eyes and ears of the enemy.
> Let those eyes and ears know no friendship.
> Let them be outcasts in their own land.
> The blood of the martyrs shall be on them and their children's children, and they shall curse the mothers that bring them forth.

(Copy this out accurately four times, and send it to four of your friends.)

[2] During 1919 11 policemen were murdered, in addition to many seriously wounded.

[3] Writing in *The Times* (Nov. 4) Prof. A. L. P. Dennis, of Wisconsin University, described Ireland as "a land of plenty."

[4] In Clare, on Oct. 21, a farmer was murdered, and his wife kicked and beaten, by masked men.

[5] Secretary to the Irish Convention (see above).

[6] At the National Liberal Club, Oct. 30.

[7] Policemen, mortally wounded, sometimes lay unattended in crowded streets, no one daring to give them a drink of water.

tenant, as he was motoring from Ashtown station to the viceregal lodge. Happily none of the bombs and shots discharged at the viceregal party took effect; but one of the assailants, a youth named Michael Savage, was killed. On the 22nd the offices of the *Irish Independent* were raided and the machinery smashed, by masked men, because the editor had described this young man as "a would-be assassin." Murders, assaults, highway robberies, burnings, attempts to wreck trains—such was the situation in Ireland when, on the eve of the close of the parliamentary session, the Chief Secretary, Mr. Ian Macpherson, and Mr. Lloyd George, introduced the new Government of Ireland bill.

This measure proposed to set up in Ireland two parliaments, one for the six counties of N.E. Ulster, another for the rest of Ireland. The unity of Ireland was to be preserved by a Council of Ireland, consisting of members nominated by the two parliaments, "with a view to the eventual establishment of a parliament for the whole of Ireland, and to bringing about harmonious action between the parliaments and governments of Southern Ireland and Northern Ireland, and to the promotion of mutual intercourse and uniformity in relation to matters affecting the whole of Ireland, and to providing for the administration of services which the two parliaments mutually agree should be administered uniformly throughout the whole of Ireland." It was proposed, under Sec. 3, that the two parliaments, by identical Acts agreed to by an absolute majority of the House of Commons of each parliament, should have power to establish, in lieu of the Council, a parliament for the whole of Ireland. Imperial services—army, navy, foreign relations, etc.—were reserved to the Imperial Parliament; but certain services, *e.g.* the post-office, were to be transferred if and when the two parliaments should agree to merge into one, while, in this event, the vexed question of customs and excise was to be settled by agreement between the Irish and Imperial Parliaments. The contribution of Ireland to Imperial expenditure was provisionally fixed at £18,000,000 per annum.

***The Home Rule bill, 1920.***

The reception met with in Ireland by this attempt to reconcile the principles of the self-determination of Ireland with that of the self-determination of Ulster and the interests of Great Britain and the Empire was not encouraging. The Sinn Feiners and Nationalists generally refused to have anything to say to a scheme which, in view of the temper of Ulster, seemed to make the partition of Ireland permanent, and certainly fell very short of the ideal of national independence. The Unionists in the South, and especially those of the three Ulster counties excluded from the northern parliamentary area, denounced the bill as a betrayal of their interests, since it left the Protestants elsewhere than in the N.E. in a hopeless minority; while the Roman Catholic hierarchy equally denounced "an impossible scheme" which subjected the Catholics of the North to a Protestant parliament. Only the Ulstermen accepted the settlement, not because they liked it, but because they saw in it the only alternative to the automatic coming into force of the Home Rule Act of 1914.[1]

***Reception in Ireland.***

Even more immediately unhappy was the effort of the Government to clear the way for Home Rule by removing the deep-seated grievance of the Irish school-teachers, which had been one of the strongest recruiting agents of Sinn Fein. The teachers had for long past been grossly underpaid; they were at the mercy of their clerical school managers; and neither of these wrongs could be righted without introducing into Ireland the principle of popular control which had long been established in Great Britain. Two specially appointed viceregal commissions had recently reported on the subject, and their reports had been signed unanimously by the Irish Roman Catholic representatives. When, therefore, on Nov. 24 Mr. Ian Macpherson, the Chief Secretary, introduced in the House of Commons an Education bill embodying the recommendations of the reports, he did so with some confidence that it would be welcomed in Ireland. By the school-teachers it was indeed welcomed; but the hierarchy at once protested against a measure which threatened their autocratic control of the schools, their protest was supported by the Council of the (Catholic) National University, and after nearly a year of abortive effort the bill was shelved.

***The Education Bill.***

One great remedial measure had thus broken down once more on the opposition of the Irish hierarchy; another, the Labourers' (Ireland) Act, passed unnoticed in the general turmoil. The situation, indeed, was rapidly passing beyond the stage when the Government could hope to meet it by a policy of alternate "conciliation" and "coercion." Hitherto the campaign of murder and of intimidation generally had been sporadic and to a certain extent spontaneous. Early in 1920 it received a definite organization, which was developed during the year with such thoroughness that there was scarce a house in Ireland where the ordinary citizen felt safe from the activities of Sinn Fein spies and agents. To speak with disapproval of the policy of murder was to risk incurring a sentence at least of "banishment," conveyed by anonymous letter; and, since the police were powerless to give effective protection, the sentence had to be obeyed. Death was the penalty for disobeying the orders of the "Republic" and the executive of this Republic was a body shrouded in mystery. "Executions" of "traitors," or "informers," or of those who dared continue in the service of the "foreign" Government, were carried out ruthlessly in broad daylight, in the crowded streets of cities, in the smoking-rooms of clubs, in the bar-rooms and bedrooms of hotels, and no one knew by whom the sentences were passed nor what process of trial, if any, was used in arriving at them. The murders were, with a few exceptions, carried out with perfect impunity; for such was the terror that no one dared interfere or come forward as a witness,[2] and in the few cases where arrests were effected the Government had generally to depend on the evidence of soldiers and police, if any happened to have been present.

***The Murder Campaign.***

It is impossible here even to outline the terrible tale of crime which stains the annals of Ireland during 1920, the most bloody since the mutual slaughter of 1798. Most of the victims were of humble rank, usually policemen and soldiers, done to death on the instructions issued towards the close of 1919[3] by Sinn Fein—or the hidden force of the old Irish Republican Brotherhood masquerading under its name. The comparative numbers tell their own tale. From May 1 to Dec. 31 1919 18 policemen had been murdered in Ireland; the number from Jan. 1 to Dec. 18 1920 was 176 killed and 251 wounded.[4] From time to time there were more conspicuous victims. On March 20 the Lord Mayor of Cork, Alderman MacCurtain, was done to death in his own house by a band of masked men. The affair was surrounded with mystery, for the victim was a prominent Sinn Feiner. The coroner's jury, on April 18, found that the murder had been committed by the R.I.C., acting under the directions of the Government, and brought in a verdict of wilful murder against Mr. Lloyd George, Lord French, Mr. Ian Macpherson, Acting Inspector-Gen. Smith, R.I.C., and District-Inspector Swanzy;[5] on the 24th the Cork Corporation resolved to call on the Executive of the Irish Republic to bring this verdict to the notice of foreign Governments—which showed a characteristic lack of the sense of humour. It was very generally believed, however, that the Lord Mayor, who had expressed strong disapproval of the murder campaign, was "executed" as an object-lesson to other weak-kneed supporters of the cause. The same fate was, later, to fall upon the Mayor and Ex-Mayor of Limerick, who, though Sinn Feiners, had used their local influence in favour of peace and order. Of other crimes, three of outstanding atrocity need mention. On March 27 Mr. Alan Bell, an experienced resident magistrate who had

[1] Resolution of the Ulster Unionist Council. *The Times*, March 11 1920. "The decisions of the Council that day had been momentous. They would take no responsibility for the Home Rule bill. . . . It was all very well to say 'Why don't you go on fighting as you did before?' What were they to fight for? Could they fight for more than the freeing of Ulster from a Home Rule Parliament in Dublin? If the bill passed, they had won, and won without fighting." Sir Edward Carson to the Ulster Unionist Labour Association, *ib.*

[2] *i.e.* for the prosecution. Witnesses for the defence, to prove an alibi, could always be found in abundance.

[3] The instructions to murder police and soldiers were published in the *Belfast Newsletter* (Jan. 2 1920).

[4] In addition 54 soldiers were killed and 118 wounded.

[5] Murdered later at Lisburn.

been holding a secret inquiry under the Crimes Act, was dragged from a crowded tramcar near Dublin by a band of armed men and shot dead by the roadside. On July 31 Mr. Frank Brooke, a member of the Irish Privy Council and chairman of the S. E. Railway Co., was shot dead by armed men in his office at Westland Row Station. In neither of these cases were the murderers caught. But the blackest day of crime was Sunday Nov. 21, when, at 9 o'clock in the morning, bands of armed men visited the houses where certain young officers, mainly engaged in court-martial work, were lodged, found them all unarmed, some still in bed and others dressing, and shot them down in cold blood. Some succeeded in escaping, but in all 14 were killed. This crime, which showed the most elaborate preparation, gave proof of the most revolting treachery, and for a moment awakened the British public from its apathy about Irish affairs, received the high approval of Mr. De Valera in America, and—to judge by the description of it by Father Dominic, Lord Mayor MacSwiney's chaplain, as "a wonderful day"—was regarded by the fanatics of Sinn Fein as a glorious victory.[1]

Yet to say that Sinn Fein organized or approved these crimes, without qualification, would be to give a false impression. For certainly all Catholic Ireland did not approve them; and Catholic Ireland, with rare exceptions, was by this time Sinn Fein. In the case of very many people this adherence was due to the terror, but it would be untrue to pretend that this cause alone operated. Among the young people, especially, the Sinn Fein creed had by this time developed into something like a religious fanaticism. Since the rebellion of 1916 a whole new generation of boys and girls had grown up, baptized in the blood of the martyrs, trained to regard Ireland as the centre of the universe and England as the barbarous oppressor who for 700 years past had arrested its development and obscured its glory, and firmly convinced that, if only the yoke of the barbarian could be shaken off, Ireland would once again become a pattern of civilization to the nations. And behind this crude idealism was the economic pressure of the young manhood of the country, cooped within its narrow limits, without work, without money, and without prospects. These were the recruits, inexorably conscribed, of the armies of the "Republic" and the executors of its decrees. The great majority of this army consisted of shop-assistants and town labourers. If the farmers and the petty tradesmen professed and called themselves Sinn Fein, this was often but an accommodation to circumstances; and the term Sinn Fein, covering a variety of aspirations, might mean much or little—at most an intransigeant faith, at least a mantle of protection against an ever-present fear. And the terror was the more poignant since its sources remained obscure. None could tell what sinister forces lurked behind the self-styled "Republic," who really issued the orders in the name of Dail Eireann, or who held command at the elusive "headquarters" of the Irish Republican army. And to the welter thus produced was presently added on orgy of private crime, ancient vendettas being satisfied under the disguise of one or other of the warring forces,[2] while burglaries and highway robberies became common.

*Predominance of Sinn Fein.*

Against certain private crimes Sinn Fein for a time attempted to set its face. With the breakdown of the legal organs of Government, during the early months of 1920, in large parts of the country, the Sinn Fein organization gradually took over the administration. The municipal elections in Jan., though the new principle of proportional representation introduced under the Act of 1919 here and there produced remarkable results,[3] placed Sinn Fein in the majority in most of the corporations and councils of the South and West, which is not surprising, since apart from the intense resentment at the proposed partition of Ireland, the Sinn Fein organization had long since made it clear that those who refused allegiance to the "Republic" would be under its ban.[4] The election of Alderman T. Kelly, who was interned in England, as Lord Mayor of Dublin (Jan. 24), the hoisting of the Sinn Fein flag on the City Hall, and the removal of the sword and mace from the council chamber as "relics of barbarism," advertised the new spirit of the Nationalist municipalities. It was not, however, until May 4 that the Dublin Corporation resolved formally to acknowledge the authority of Dail Eireann and to undertake to give effect to its decrees, and its example was soon followed by other corporations, and county and district councils. On April 14 Sinn Fein "headquarters" had defined its policy with regard to these bodies; all the old councillors were to stand aside and give place to younger men who would refuse to recognize the Local Government Board, and who, being without property, could not be made liable for damages in resisting the Government. The result was, of course, the complete confusion of local administration; for the refusal of the elected bodies to submit their accounts to the Board's inspector was met by the refusal of the Government to make the statutory grants in aid of rates. The mutual boycott continued in many cases into the following year. It was combined with the wrecking and burning of inland revenue offices and the looting of Government money from post-office vans and mail trains. At the same time a general destruction of Government property began, starting with the police "barracks," which in many parts of the country had been left unprotected owing to the necessity of concentrating the police.[5] Many empty country houses, suspected of having been requisitioned by the military, were also burned down.

*Revolt of the Municipalities.*

Meanwhile Sinn Fein had set out to cure the anarchy which it had created by setting up an organized system of justice. Sinn Fein courts were early in operation; on May 12, at Kilfinane in Limerick, two Sinn Feiners were put on trial before such a court for cattle-"driving." Such irregularities were no longer to be permitted, and on the 19th, at Ballinrobe, the first public court established in Ireland under the aegis of Dail Eireann was opened to determine land disputes and effect settlements of agrarian trouble. By the 3rd of next month Sinn Fein courts had been established in 21 Irish counties,[6] and a fortnight later it was reported that a Sinn Fein supreme court was to be established in Dublin. Before the end of the summer, in two-thirds of Ireland, Sinn Fein justice was alone available; the King's writ had ceased to run; the royal judges still went on circuit, but their courts—guarded by police and soldiers—were empty of litigants, who, often unwillingly enough, had to transfer their suits to the improvised tribunals of the "Republic."

*The Sinn Fein Courts.*

These tribunals might or might not be honest and effective. They usually consisted of a Roman Catholic curate and one or two prominent local Sinn Feiners; and sometimes a lawyer's clerk, or others with a rudimentary knowledge of the procedure of the courts, took part in their decisions, which were often reported as reasonable. Substantial court fees were exacted from the litigants, which went to supply a fund for salaries for the members of the court.

In course of time people of all political opinions found it expedient to apply to these courts, if they were to have any redress; solicitors, deprived of practice in the ordinary courts, made no scruple of appearing before them, and even loyalists, compelled to sell their property occasionally, weakened when they found that the Sinn Fein land courts imposed a higher price for land compulsorily purchased than that allowed by the Land Commission. And, so long as it lasted, the authority of these courts was absolute, and for a sufficient reason—the ultimate penalty for disobedience was death.

[1] For an eye-witness's account see "Experiences of an Officer's Wife in Ireland," *Blackwood's Magazine* for May 1921, vol. ccix., No. mccixvii. "Studies in Green," published serially in the same magazine, also give a vivid picture of conditions under the terror.

[2] This accounts for several mysterious murders, charged (according to taste) to Sinn Fein or Crown forces. Outrages were often committed by men dressed in stolen police and army uniforms.

[3] A few Unionists were elected in constituencies which had always been solidly Nationalist, while the Belfast corporation included a minority of Nationalists and Sinn Feiners.

[4] "The candidates for the chairmanship of the Granard Rural District Council are requested to attend the Executive meeting and sign the Sinn Fein pledge." *Nationality*, Aug. 4 1917.

[5] These "barracks" were usually cottages, privately owned, which had been leased to the Government. Their destruction imposed a heavy burden on the ratepayers of the county—including the owners—who were assessed for compensation.

[6] *Freeman's Journal*, June 4 1920.

The existence of these courts was, of course, a criminal offence under the ordinary law of sedition; but in Ireland, after the proclamation of Sinn Fein under the Crimes Act as a dangerous association, they came within the prohibitions of the Crimes Act of 1887, and every person taking part in them was liable, after conviction before a court of two resident magistrates, to a sentence of six months' imprisonment. But the difficulty of the Government in dealing with them lay in the fact that evidence was almost impossible to procure as to their personnel or the proceedings that took place before them. It was, in short, not until the ordinary law was superseded by military administration that the Sinn Fein courts were dissolved, not by the ordinary processes of law, but by force. Once scattered, under the influence of counter-terror, they ceased to appeal even to the sentiment of the people, who on the whole had had reason to fear the incidence of a justice wholly irresponsible and arbitrary in its methods.[1]

For the highly idealized Sinn Fein account of the organization and work of these courts, see "The Republican Police and Courts of Justice," in the *Irish Bulletin*, vol. v., No. 46, Aug. 4. For the Sinn Fein Land Settlement Commission, see *ib.* No. 49, Aug. 9.

In the spring of 1921 the King's writ was once more running in the "disturbed" counties, the courts were sitting, juries were attending, and litigants were appearing to press their suits.

*Sir Hamar Greenwood and the Constabulary.*

This change, with many others, was due to the more consistently vigorous policy introduced by Sir Hamar Greenwood, who had succeeded Mr. Ian Macpherson as Chief Secretary on April 4 1920. Though formerly a Liberal Home Ruler, he realized that the distempers of Ireland had passed beyond hope of cure by any panaceas which British Liberalism was prepared to apply, and that the choice for the Government lay between yielding to force or opposing force to force. The first necessity was to restore the *moral* of the forces of the Crown. The men of the R.I.C. had for more than a year borne with amazing patience and courage the campaign directed against them. But with the intensification of this campaign towards the middle of 1920 their patience and their discipline had begun to break down. Time after time they had seen men they had arrested, for serious crimes against the State, released after a few days of easy imprisonment. Again and again they had been "let down" owing to a clamour in Parliament and the press which threatened to become inconvenient to ministers. They were murdered wholesale, and none of their neighbours dared to help them in their death agonies, still less to give evidence against their assassins, not one of whom was punished. They were subjected by order of the "Republic" to a rigorous boycott, and the tradesmen, the farmers and the creameries refused to supply their wives and their babies with the very necessaries of life, since to do so was to involve themselves in the same penalty. For armed and organized men to endure this for ever was not in human nature, and least of all in Irish human nature. In short, there was apprehension that the police, realizing that Sinn Fein had succeeded in breaking down the law, would begin to take the matter into their own hands.

*The "Black-and-Tans."*

The Royal Irish Constabulary, indeed, was by this time but a remnant of a once magnificent force. The campaign of murder and boycott had largely done its work; the men were resigning under a threat of murder or other outrage on their parents, and any young man who was announced as going to join the force was promptly shot. At the same time the catalogue of crimes of all descriptions in Ireland was reaching appalling proportions; and it became necessary for the Government to adopt a far stronger policy, if the country was to be saved from lapsing into utter anarchy. In March Mr. Ian Macpherson, in answer to a question in the House of Commons, had estimated the numbers of the Irish Republican army at 200,000, thus outnumbering the forces of the Crown in Ireland by about five to one. In July the troops in Ireland were increased to 60,000, and the supreme command was taken over by Sir Nevil Macready, a general[2] with a long and distinguished record. On the 10th the Government issued instructions for the reorganization of the R.I.C., the depleted ranks of which were to be filled up with English and Irish ex-service men; and at the same time there was created an auxiliary police force consisting of 1,500 ex-officers, divided into 15 mobile companies, for the purpose of carrying out special duties wherever they might be required. Since there were not enough of the dark green uniforms of the R.I.C. to supply all the new recruits, these were clothed temporarily in military khaki, with a black hat and arm band to distinguish them as constables—whence the name "black-and-tans." They must be distinguished from the auxiliary police, whose uniform continued to be khaki with a black glengarry cap, and who were therefore also sometimes known as "black-and-tans." The whole of this force was placed under the control of Maj.-Gen. Sir Henry Tudor,[3] who was established in the Castle as Police Adviser.

The presence of this force soon altered the condition of things in Ireland. The military, who after the great disbandment had consisted mainly of raw boys hardly able to bear the weight of their rifles, had been no match for the strapping guerrillas of Sinn Fein. The "black-and-tans" and the auxiliary cadets (it is well to distinguish them) were men hardened by years of service at the front and brave to recklessness, as they needed to be. Systematically distributed over the disturbed areas of the country, they proceeded to break up the Sinn Fein organization; soon its leaders were "on the run"; and the authority of the Crown was gradually reëstablished in wide districts where for months past the *de facto* Government had been that of the "Republic." In the performance of this difficult and very dangerous task serious irregularities were sometimes committed, but on the whole the "black-and-tans" were not unpopular; for they broke the Sinn Fein terror and—as the women put it—saved the boys from being forced into the murder gangs.[4] Soon, however, the wildest reports began to circulate about the outrages committed by them, reports grossly exaggerated, but none the less having a basis in fact. There is, indeed, no evidence whatever to support the accusations of outrages on women, or indeed of any gross crimes committed on innocent people, and these may be characterized as absolute lies. But there is evidence that some of these men—by no means all—brought to Ireland the loose view as to the rights of property which had been current during the war at the front, and helped themselves to what they needed without always discriminating between the loyal and the disloyal.

*Reprisals.*

More serious were the issues raised by the "reprisals" carried out by the force, or rather by some of its members, when any of them were murdered. In matters of this sort it is not the function of the historian to approve or to condemn, but to explain; and in this case the explanation is not far to seek. The general attitude of the "black-and-tans" is explicable by the abnormal conditions under which they worked. They found themselves in a country nominally and even apparently at peace, for its normal life continued through all the troubles, and among a people polite and outwardly even demonstratively friendly. They soon discovered that this was all illusion; that the country was a prey to civil strife in its most cruel and barbarous form; and that the seeming urbanity of the people was too often a treacherous mask. It is not surprising if, not knowing the people as the old R.I.C. men had intimately known them, they were often unable to distinguish realities from appearances, and confounded the veiled Sinn Feiner with the real Sinn Feiner, and the loyalist with both. As for reprisals, they are best explained by instances.

[1] Dail Eireann had fixed a prescription of 20 years as giving legal title to land. A Sinn Fein Court in county Cork ordered the sale of his farm by a man whose family had held it since 1847, and the distribution of the proceeds among people who claimed to be descendants of the owner who had emigrated to America after the great famine. (Private information.)

[2] B. 1862. In addition to distinguished war service in Egypt, S. Africa and the World War, Sir Nevil Macready was commissioner of the London Metropolitan Police 1918–20 and had dealt successfully with the great police strike.

[3] B. 1871. Served with distinction in the S. African War and throughout the World War. He commanded the 9th Division in France in 1918.

[4] From private information. Reports about this, as about most matters in Ireland, are very contradictory.

The first serious act of reprisal took place at Balbriggan, county Dublin, on Sept. 21, when District-Inspector Burke, an exceedingly popular officer, and another constable were shot dead in the bar of a public-house. The murderers used expanding bullets, and when the disfigured corpses of the two constables were carried into the police barracks the men "saw red," and that night the houses and shops of the Sinn Fein leaders in the town went up in flames. Similar scenes followed the ambushing and murder of six constables at Rinneen, county Clare, on the 29th. The infuriated police descended on the neighbouring towns of Miltown-Malbay, Lahinch and Ennistymon, set fire to certain houses and shot two men.[1] Continued murders of police led, at the end of Oct., to a renewal of these reprisals, armed men invading and causing much destruction in the towns of Granard, Tralee, Ballymote, Tipperary, Athlone, Killorglin, Miltown-Malbay, Longford and Templemore.[2] The discovery of five constables lying on the high road, with their brains battered out, led to similar reprisals at Tubercurry (Oct. 2). In vain their officers tried to restrain the enraged men; they turned savagely upon them and threatened to shoot them if they interfered.[3] The ambushing of a party of auxiliary police at Dillon's Cross, Cork, on Dec. 18, was followed by incendiary fires in Cork city, in the course of which the City Hall and the Carnegie Library were destroyed, but there is no information as to who was responsible, though public opinion fixed responsibility upon the police. But though, in these other cases, the discipline of the police gave way, the cases were far more numerous in which it stood the awful test. No reprisals followed the treacherous massacre of the young officers in Dublin on Nov. 21. No reprisals followed the horrible affair of Macroom, county Cork, when (Nov. 29) 17 auxiliary cadets were lured into an ambush of 100 Sinn Feiners disguised as British soldiers, and 15 of them murdered, no quarter being given and the dead savagely mutilated.[4]

The irregular reprisals, moreover, were not all the work of the police. When Inspector Swanzy was murdered at Lisburn on Aug. 8 1920, the Protestants, who were in a great majority in the town, doubly enraged by this outrage in evangelical Ulster, rose and—in spite of all the efforts of the local clergy to stop them—burned many Catholic houses. The murder of a policeman in Belfast was followed, on Sept. 25, by attacks of Orangemen on Sinn Feiners and a renewal of the sectarian riots which in July had kept the city in a turmoil and now again necessitated its occupation by the military.[5]

The temper of the constabulary placed the Government in a delicate position. To approve of irregular reprisals was impossible, to condone them was dangerous, and worse. Yet to take stern and drastic measures against them was equally impossible in view of the general feeling among the troops and the police, for this might easily have led, either to their resignation *en masse* (which was what Sinn Fein was aiming at), or to their getting utterly out of hand and sweeping with fire and sword through the country. Above all, to have shown the slightest sign of a disposition to "let the police down" again, would have been almost certainly disastrous. It is not the present writer's intention either to attack or to defend the apparently equivocal attitude at first assumed by the Government towards this question of reprisals, which was bitterly criticised, but merely to state the conditions by which it was determined. It is certainly true to say that Sir Hamar Greenwood, by his consistent championship of the forces of the Crown against their critics and detractors, succeeded in winning their confidence and thus in re-creating the essential conditions for the restoration of effective discipline. One lesson, moreover, the irregular reprisals had taught the Government, namely, that fear will open the lips that fear has sealed. On the very night of the Balbriggan reprisal, for the first time, men came to the police to denounce the murderers, moved by fear that their own houses might be burned.

In view of the refusal of people to come forward except under pressure of this kind, the Government decided to make certain areas collectively responsible for the murder of soldiers and police. Where ambushes were elaborately prepared for days beforehand, telegraph wires being cut, and the roads for miles round being made impassable by trenches or felled trees, it was assumed that these treacherous attacks must have been delivered if not with the connivance, at least with the acquiescence, of the people. While, then, irregular reprisals were to be sternly repressed and punished, Gen. Macready issued an order that houses in the immediate neighbourhood of an ambush were to be burned, not as a reprisal, but as a punishment for the failure of the inhabitants to give information which by law they were bound to do. This was the origin of what were known as "official reprisals," which began to be carried out early in 1921.

Such was the condition of things in Ireland—frankly recognized as "a state of war"—when, on Dec. 23 1920, the new Government of Ireland bill became law. It had few friends even in Parliament; it had been debated in empty Houses; it received no welcome outside, except in Ulster, where it was welcomed as an ark of salvation from worse things. It gave, it is true, greater powers to the Irish legislatures than those given by the Act of 1914; it provided machinery for safeguarding the essential unity of Ireland in spite of "partition," and for securing corporate unity whenever the dissevered halves of the Irish people should arrive at an understanding. But the machinery for conciliation is useless without the driving force of the spirit of conciliation; and to the mass of the Irish people, who do not know the meaning of the word compromise, it seemed but a cumbrous device for burdening their shoulders with a responsibility which was not theirs. In the North preparations at once began to put the Act in force whenever "the appointed day" should be named, Sir James Craig for this purpose taking over the Ulster leadership from Sir Edward Carson. In the South nobody believed that the day would ever be named, at least so far as Ireland outside Ulster was concerned; for it was thought improbable that sane men would try inflammatory constitutional experiments in a political powder magazine. In this, however, the South was mistaken; for in April the Government fixed the appointed day, and on the 21st instructions were sent to Dublin to make all the preparations necessary for the elections. At the same time it was announced that the lord lieutenancy had been accepted by Lord Edmund Talbot (created Viscount Fitzalan of Derwent), a brother of the late and uncle of the actual Duke of Norfolk, who, as a Roman Catholic, had become eligible for the office owing to the removal of the last remnant of Catholic disabilities by the Act.[6] The attitude of the Government at this stage on the question of "reprisals" can be best explained by quoting from a letter written on April 19 1921 by Mr. Lloyd George to the Bishop of Chelmsford, who with 19 other English Protestant prelates and ministers had addressed to him a strong remonstrance against "the whole reprisals policy" and a plea for negotiations for a "truce."[7] The Prime Minister wrote:—

*The Government and "Reprisals."*

That there have been deplorable excesses I will not attempt to deny. Individuals working under conditions of extraordinary personal danger and strain, where they are in uniform and their adversaries mingle unrecognizable among the ordinary civilian population, have undoubtedly been guilty of unjustifiable acts. A certain number of undesirables have got into the corps, and in the earlier days discipline in the novel and exacting conditions took some time to establish.

There is no question that, despite all difficulties, discipline is improving, the force is consolidating, and that the acts of indisci-

[1] The fires were put out by the military, assisted by police.

[2] *Irish Times*, weekly ed., Nov. 6 1920.

[3] Private information. All these reprisals up to Oct., were the work of the old R.I.C., not of the "black-and-tans."

[4] It was reported at first that Macroom had been burned, but this was contradicted next day. One fire broke out, but was extinguished with the aid of the soldiers and auxiliary police.

[5] During 1920 the partisan war had been assuming more and more a "religious" character, many outrages on Protestant churches and murders of Protestant farmers being reported from the South.

[6] Hitherto the Lord Lieutenant had by law to be Protestant.

[7] It may be noted that no such remonstrance came from the Protestant bishops or Presbyterian ministers of Ireland.

pline, despite ambushes, assassinations and outrages, often designed to provoke retaliation for the purposes of propaganda, are becoming increasingly infrequent. I venture to believe that when the history of the past nine months in Ireland comes to be written, and the authentic acts of misconduct can be disentangled from the vastly greater mass of reckless and lying accusations, the general record of patience and forbearance displayed by the sorely tried police, by the auxiliaries as well as by the ordinary Constabulary, will command not the condemnation but the admiration of posterity.

The deplorable condition of Ireland Mr. Lloyd George ascribed mainly to the intransigeance of Sinn Fein:—

I do not wish to minimize in the least Great Britain's share of responsibility for the present state of the Irish question. But at last all parties in Great Britain had united, in the general election of 1918, in asking and securing from the electorate a mandate to give to Ireland the Home Rule which had been pleaded for by Gladstone and asked for by all the leaders of Irish Nationalism since Isaac Butt, including Parnell, Dillon and Redmond. The only unsettled question was the treatment of Ulster, and as to that, both the Liberal party had recognized in 1914, and the Irish Nationalists in 1916, that if there was to be a peaceful settlement Ulster must have separate treatment.

Sinn Fein rejected Home Rule and demanded in its place an Irish Republic for the whole of Ireland. Sinn Fein went further. It deliberately set to work to destroy conciliation and constitutional methods, because it recognized that violence was the only method by which it could realize a Republic. The rebellion of 1916 was its first blow to conciliation and reason. Its refusal to take part in the Convention was the second. Its proclamation of a Republic by the Dail Eireann and abstention from Westminster was the third. Its inauguration of the policy of murder and assassination in order to defeat Home Rule, rather than to discuss the Home Rule bill in Parliament or enter upon direct conference outside, was the fourth.

I do not think that anybody can doubt that the principal reason why the war did not bring a peaceful settlement, and why Ireland is more deeply divided to-day than it has ever been, has been the determination of Sinn Fein to prevent such a settlement and to fight for a republic instead.

But there is another aspect of the question to which I must allude. Sinn Fein does not confine its activities to attacks on servants of the Crown. It has inaugurated a reign of terror in Ireland which is certainly equal to anything in Irish history. Its hold on the country is due partly, no doubt, to the fanatical enthusiasm it invokes, but partly it is due to terrorism of the most extreme kind. Its opponents in Ireland are murdered ruthlessly, usually without any form of trial, with no chance of pleading their case, simply because the Sinn Fein leaders think them better out of the way.

The case of Sir Arthur Vicars[1] has excited horror because it is the murder of a well-known man. But it is only typical of what is going on all over the country. I may mention two other instances.

In the first, William P. Kennedy, a Nationalist Irishman of the school of Dillon, refused to close his premises, at Borris, county Carlow, on the occasion of the death of Lord Mayor McSwiney of Cork.[2] He was boycotted, and thereupon took an action for damages against a number of his enemies, Michael O'Dempsey being his solicitor. A short while after, both Kennedy and O'Dempsey were shot from behind a wall in front of Kennedy's house.

In the second case William Good, an ex-captain in the army, who had resumed his studies at Trinity College, Dublin, after being demobilized, returned home to attend the funeral of his father who had been murdered at his own door a few days before. He drove in to Bandon on marketing business. On his return he was waylaid by armed and masked men, carried some way and done to death, the following notice being found:—"Tried, convicted, and executed; spies and informers beware."

The last two cases seem even worse. The first was the atrocious case recorded in the newspapers of April 8, where an unarmed, defenceless, and war-crippled ex-soldier was murdered with revolting brutality in the presence of his mother and sister, who were spattered with his blood. The second is in the papers this morning, where a poor woman named Kitty Carroll, the sole support of her aged father and mother and invalid brother, was dragged from her house by a party of masked men, who murdered her and attached to her body this legend: "Spies and informers beware! Tried, convicted, and executed by I.R.A."[3]

I cite these cases because I think it is essential that people should realize the character of the Sinn Fein policy, the principles upon which it acts, and the nature of its campaign. Sinn Fein has never issued any condemnation of murder. Assassination and outrage are the weapons which it has deliberately chosen as the means by which it is to gain its ends. I should like to repeat that it was not until over 100 of their comrades had been cruelly assassinated that the police began to strike a blow in self-defence. . . . The present state of affairs is due to one cause, and one cause only—that there is still an irreconcilable difference between the two sides. The one side—or, rather, the group which controls it—stands for an independent Irish Republic; the other stands for maintenance in fundamentals of the Union, together with the completest self-government for Ireland within the Empire which is compatible with conceding to Ulster the same right of self-determination within Ireland as Nationalist Ireland has claimed within the Union. . . .

A truce in itself will not bridge the gulf, though it might be useful if there were any doubt on either side as to where the other stands, or a basis for discussion were in sight. What really matters, if we are to attain to peace, is that a basis for a permanent settlement should be reached.

I fully admit, and I have always admitted, that the declared policy of Sinn Fein and the policy of His Majesty's Government are irreconcilable. I believe that the policy of establishing an Irish Republic is impossible for two reasons; first, because it is incompatible with the security of Great Britain and with the existence of the British commonwealth; and second, because if it were conceded it would mean civil war in Ireland—for Ulster would certainly resist incorporation in an Irish Republic by force—and in this war hundreds of thousands of people, not only from Great Britain but from all over the world, would hasten to take part.

On the other hand, I believe that the policy of the Government—the maintenance in fundamentals of the unity of the kingdom, coupled with the immediate establishment of two parliaments in Ireland with full powers to unite on any terms upon which they can agree upon themselves—is not only the sole practical solution, but one which is both just and wise in itself.

But the present struggle is not about the Home Rule Act at all. Fundamentally the issue is the same as that in the War of North and South in the United States—between secession and union.

At the outbreak of the great American struggle nearly everybody in these islands sympathized with the South and was against the North. Even Gladstone took this view. Only John Bright never wavered in his adherence to Lincoln's cause. That war lasted four years. It cost a million lives and much devastation and ruin. There was more destruction of property in a single Confederate county than in all the so-called "reprisals" throughout the whole of Ireland.

Lincoln always rejected alike truce and compromise. As he often said, he was fighting for the Union and meant to save it even if he could only do so at the price of retaining slavery in the South. . . .

Is not our policy exactly the same? It is by reason of the contiguity of the two islands and their strategic and economic interdependence that it is necessary to fight secession and to maintain the fundamental unity of our ancient kingdom of many nations from Flamborough Head to Cape Clear, and from Cape Wrath to Land's End. I believe that our ideal of combining unity with Home Rule is a finer and a nobler ideal than that excessive nationalism which will take nothing less than isolation, which is Sinn Fein's creed to-day, and which if it had full play would Balkanize the world. . . .

I do not see, therefore, how we can pursue a different line of policy. It has never been our policy to refuse compromise about anything but the Union itself and the non-coercion of Ulster. Throughout the whole of last year when the Home Rule bill was before Parliament, I invited negotiations with the elected representatives of Ireland, stating that the only points I could not discuss were the secession of Ireland and the forcing of Ulster into an Irish Parliament against its will. . . .

To these overtures there was never a reply. And there has never been a reply, for the good reason that the real Sinn Fein organization is not yet ready to abandon its ideal of an independent Irish Republic, including Ulster. That there are many Sinn Feiners who recognize the folly and impossibilism of this attitude is certain. But I regret that no less certainly up to the present the directing minds of the Sinn Fein movement, who control the Irish Republican army—the real obstacle to peace—believe that they can ultimately win a republic by continuing to fight, as they fight to-day, and are resolutely opposed to compromise. . . .

So long as the leaders of Sinn Fein stand in this position, and receive the support of their countrymen, settlement, is in my judgment, impossible. The Government of which I am the head will never give way upon the fundamental question of secession. Nor do I believe that any alternative Government could do so either.

Such was the situation when, on May 2 1921, the new Lord Lieutenant took the oath of office, with all the old world ceremonial, in Dublin Castle. The realities of the situation were more clearly suggested three days later. On May 5 Sir James Craig, the Ulster leader, accepted an invitation to a conference with the Sinn Fein "President," Mr. De Valera. Rumour was rife as to the significance of this meeting. Sinn Fein had declared "war"

*Lord Fitzalan Viceroy.*

[1] Formerly Ulster King-at-Arms and head of the Irish Heralds College. He was dragged from his house by a roving band of armed men on the night of April 14 1921 and riddled with bullets, his house being burned.

[2] He died as the result of a hunger strike of 63 days on Oct. 25 1920 in Brixton prison. This ended the policy of hunger strikes.

[3] She had rashly given information, *through post*, to the police of the existence of a still for the illicit distribution of whisky. This came out after the date of the Prime Minister's letter.

against secessionist Ulster; the campaign of outrage had been extended to the North; and in the South a boycott of goods coming from Belfast was said to be spreading consternation in Northern trading circles. It was suggested that De Valera had merely invited Sir James Craig in order to impress upon him the ultimate consequences of this policy to Ulster, and to invite him to come to terms with the "Republic." The general opinion, however, was that the meeting was a genuine sign of a desire to find a *modus vivendi*, and this impression was deepened by the manifesto issued by the Ulster leader next day. Sir Edward Carson, in resigning the leadership, had said that the supreme object of the new Government of the six counties ought to be peace. "Rather than fight these people," he said, "try to win them over to us." Similarly Sir James Craig now put in the forefront the "earnest desire for the peace of Ireland."

There was little enough evidence of the growth of a spirit of compromise. Sinn Fein had decided to take part in the elections for the new Parliament, but without thereby receding an inch from its intransigeant position. In the actual conditions of the country it was clear that no one would dare to stand in opposition to a Sinn Fein candidate, and the unopposed return of a Republican member for every constituency in the South and West of Ireland, combined with the solid refusal of those returned to attend the new Parliament or to take the oath of allegiance, would be the best possible advertisement to the world of the deliberate verdict of the Irish people on the policy of "partition." In effect, when on May 13 the nominations were made, it was found that in no single constituency was there to be a contested election. Of the 128 constituencies of the South and West 124 returned Sinn Feiners unopposed. The four members for Dublin University, also returned unopposed, were not Sinn Feiners; but they were nominees of no party and were bound by no pledges save to study the interest of the university and to work for a settlement which should bring peace and unity to Ireland. The elections for the Northern Parliament, which took place on the 23rd, produced results scarcely less unequivocal as an expression of the temper of the Protestant North. The Unionists had only counted on winning 32 of the 52 seats; they actually won 40. Six Nationalists, including Mr. Joseph Devlin, were returned, and six Sinn Feiners, including De Valera, Arthur Griffith, and Michael Collins, all in the preponderantly Roman Catholic constituencies. Both Nationalists and Sinn Feiners announced their intention of not taking their seats.

***Elections for the Irish Parliaments, 1921.***

The triumph of Sinn Fein at the elections was followed by an intensification of the "war," which was now carried into "the enemy's country." During the week-end May 14–6 large numbers of armed and masked men engaged in shooting and burnings in London, St. Albans and Liverpool, the objects of these attentions being the relatives of members of the R.I.C. In Ireland itself the same week-end witnessed two horrible crimes—the murder of District-Inspector Maj. Biggs and of Miss Barrington, daughter of Sir Charles Barrington, between Glenstal and Newport, and the murder of District-Inspector Blake and his heroic young wife, together with two young army officers, as they were returning from a tennis party at Ballyturin House in Galway. On the 22nd, the day before the Ulster elections, there was read in all the Roman Catholic churches a letter of Pope Benedict XV. to Cardinal Logue, in which His Holiness, while urging peace, gave discreet encouragement to the Sinn Fein cause by suggesting that the Treaty of Versailles had not given "sufficient consideration to the desires of the nations." Three days later the Customs House, a lovely example of late 18th century classical architecture and the most beautiful building in Dublin, was entered by a large band of armed men and set on fire; it burned for three days, till only the shell remained. This act was ordered by Dail Eireann, which justified its action in the *Irish Bulletin* by saying that the destruction of this noble monument was necessary in order "to save the lives of four million people." Of the attackers more than 100 were arrested, while 30 or 40 are said to have been trapped in the building and burned to death. Some inconvenience was caused to the Government, owing to the destruction of the records of the Local Government Board and the Board of Inland Revenue, but far more to private individuals, since an immense number of deeds and other documents were lost. Claims for damages amounting to several millions of pounds sterling were immediately lodged against the Dublin Corporation.

***"War" in Ireland and England.***

On the day following this outrage (May 26) Mr. Lloyd George declared in Parliament that it would be necessary to send more troops to Ireland, and two days later a considerable number were accordingly dispatched. Meanwhile Sir James Craig had gone to London, and on the 31st it was announced that further efforts were to be made to secure peace. The omens were not auspicious. In Sinn Fein Ireland the more turbulent elements were entirely out of hand, and the utter insecurity of life and property, together in many cases with the complete interruption of ordinary communications, were quickly strangling the economic life of the country. The organization of the I.R.A. in the county districts had been largely broken up, and many once disturbed areas were now peaceful; but "flying columns," which owed their mobility to "commandeered" motor-cars and bicycles, scoured the country, ambushing small parties of constabulary—as in Kerry on June 2—levying "taxes," burning country houses and kidnapping gentlemen, and sometimes ladies, of unpopular views. The cutting of telegraph and telephone poles, and the digging of trenches across roads, were organized on a large scale, men of all classes and opinions being forced at the revolver's point to take part in this work. On June 2 telephone posts were cut down at Liverpool, and on the night of June 7–8 hundreds of wires were cut in places so far apart as Cardiff, Hatfield and Bexley; the outrages in England culminated on the night of June 16 in a series of attacks on signal boxes and signalmen in the suburbs of London with the object of wrecking trains, attacks which were renewed at Manchester on the 18th. On June 9 the Government published as a "white paper" (Cmd. 1326), under the title of "Intercourse between Bolshevism and Sinn Fein," the text of a proposed treaty between the Russian Soviet Government and the Irish Republic which Dr. McCartan, M.P. for King's county, had gone to Moscow to negotiate.

Meanwhile, on the 7th, the Northern Parliament had been opened at Belfast, and the Government constituted. Sir James Craig became Prime Minister; Mr. H. McD. Pollock, chairman of the Belfast Chamber of Commerce, Minister of Finance; Sir R. Dawson Bates, Minister for Home Affairs; Mr. J. M. Andrews, Minister of Labour; the Marquess of Londonderry, Minister of Education, and Mr. E. M. Archdale, Minister of Agriculture and Commerce. The Hon. Hugh O'Neill, son of Lord O'Neill, was elected Speaker. The Parliament was opened by Visct. Fitzalan, the Lord Lieutenant, whose speech excited particular attention because of its reference to the Government of Ireland Act. "The Act," he said, "is not perfect. It needs amending, and I should not be surprised if it were amended in the near future."

***The Northern Parliament.***

The significance of this statement was taken to lie in the fact that in parliamentary circles in London the opinion was gaining ground that, before applying "crown colony" Government to the refractory South of Ireland as provided for in the Act, an attempt should be made to win it over by further concessions. On June 21 the Earl of Donoughmore, a large landowner in county Tipperary, moved in the House of Lords that "the situation in Ireland urgently requires that His Majesty's Government should be prepared to propose and authorize negotiations to be opened on such terms as they think calculated to terminate the present deadlock." In opposing the motion the Lord Chancellor, speaking presumably on behalf of the Government, denied that anything in Lord Fitzalan's speech implied any intention of the Government to bring in an amending bill, and said that the amendments referred to were only concerned with minor matters. He admitted the gloom of the situation;

***The Government and Sinn Fein.***

that there was a "small war in Ireland"; and that "our military methods had failed to keep pace with and to overcome the military methods of our opponents." The establishment of the Northern Parliament had emphasized the fact that there was not one Ireland, but two Irelands. The only hope lay in the representatives of these two Irelands coming together and working out a basis of agreement, and from this point of view the meeting of Sir James Craig and Mr. De Valera was of hopeful augury. If it were still necessary to deal with the situation by force, the force would be forthcoming, whatever sacrifices this might involve for the people of Great Britain. As for the suggestion that the Government should negotiate, "those with whom we should negotiate are most illusive . . . there will be no peace until an adjustment is made—if, indeed, that be possible—with those actually carrying on, or inspiring, the policy of violence."

This speech showed an accurate appreciation of the situation in Ireland; it was less accurate as an interpretation of the mind of the Government, or at least of the Prime Minister.

*The King in Belfast.*

On the next day (June 22) a new phase of the question was opened by the visit of the King and Queen to Belfast to open the first session of the new Parliament. The news that the King intended to open the Parliament in person had been received with misgiving in the South of Ireland, not because of any possible danger involved, but because it was feared that this action might compromise the position of the Crown as an impartial influence, and that Republican sentiment, which in Ireland is not very deep or strictly logical, might be still further alienated by this royal patronage of Belfast to the neglect of Dublin. These fears were, however, speedily belied. Their Majesties were, indeed, received in Belfast with splendid demonstrations of popular loyalty, but in his speech from the throne the King made it clear that his visit was not intended for Belfast or the six counties alone. "This is a great and critical occasion for the six counties," he said, "but not for the six counties alone, for everything which interests them touches Ireland, and everything which touches Ireland finds an echo in the remotest corners of the Empire. . . . I appeal to all Irishmen to pause, to stretch out the hand of forbearance and conciliation, to forgive and forget, and to join in making for the land they love a new era of peace, contentment, and good-will."

Two days later (June 24), a troop train carrying the 10th Hussars, who had formed part of the King's escort in Belfast, was blown up by a land-mine at Adavoyle, some 10 m. south of Dundalk; three soldiers and a guard were killed, and a large number of horses were mutilated and killed. On the same day Mr. Lloyd George addressed a letter to Mr. De Valera, as "the chosen leader of the great majority of Southern Ireland," inviting him to attend a conference in London, "to explore to the utmost the possibility of a settlement," and to bring with him for the purpose any colleagues whom he might select. A similar invitation was addressed to Sir James Craig, the Ulster Prime Minister, who at once accepted. Four days later (June 28) the Parliament of Southern Ireland was opened in the Council Chamber of the Department of Agriculture; but the only members of the Lower House present were the four representatives of Dublin University, together with 15 out of 64 senators, and the Parliament was at once adjourned. On the same day a special issue of the *Irish Bulletin*, the official publication of the Sinn Fein "Government," published the "President's" reply to Mr. Lloyd George. Mr. De Valera said that he was in consultation with such of the principal representatives of the Irish nation as were available, that he and they desired most earnestly to bring about a lasting peace between the English and Irish peoples, but that he could see no avenue by which a lasting peace could be reached if the British Premier "denied Ireland's essential unity and set aside the principle of national self-determination." He added that he was seeking a conference with certain representatives of the political minority in Ireland. The five gentlemen invited to this conference were, as announced in the same number of the *Bulletin*, Sir James Craig; the Earl of Midleton; Sir Maurice E. Dockrell, Unionist member for S. Dublin in the Imperial Parliament; Sir Robert H. Woods, an eminent surgeon who had been elected as a Unionist for Dublin University mainly as a representative at Westminster of the medical faculty; and Mr. Andrew Jameson, head of the famous firm of whisky distillers and chairman of the Dublin Chamber of Commerce. Sir James Craig refused the invitation on the ground that he had already accepted the Prime Minister's invitation to London. This refusal and Mr. De Valera's comment on it illustrated the fundamental cleavage between Sinn Fein and the Ulster Unionists. "Mr. Lloyd George's proposal," wrote the "President," "because of its implications is impossible of acceptance in its present form." Irish political differences, he urged, ought to be settled on Irish soil, and in negotiating with Great Britain the Irish delegation ought to act as a unit on some common principle. It seemed, indeed, from the first as though it would prove impossible to find a basis even for discussion, let alone a settlement. Throughout the preliminary negotiations the Sinn Fein President and officials carefully avoided using a single phrase susceptible of being interpreted as a modification of their claim to be the legitimate Government of Ireland negotiating with a foreign Power. The representatives of the six counties, on the other hand, "stood with both feet on the Better Government of Ireland Act," and, as Sir James Craig put it, made no offers because they "had nothing to give away."

*Negotiations for a Settlement.*

On June 30, as an earnest of the genuineness of the Government's desire for an accommodation, four members of Dail Eireann, Messrs. Arthur Griffith, John McNeill, Staines and Eamon Duggan, were released from Mountjoy gaol, where they had been interned for eight months, in order that they might take part in the discussion. Meanwhile, the four "representatives of the minority"—they were, of course, representatives in no strict sense—had accepted the invitation of Mr. De Valera, and the first conference between them and the Sinn Fein leaders took place at the Dublin Mansion House on July 4. The fact that the conference did not at once collapse, but was adjourned, was announced in the *Irish Bulletin* of the 5th as affording gratifying proof "that Irishmen of hitherto widely divergent opinions can continue to deliberate upon the best means of showing a united front to England at this crisis." To emphasize the moral of this phenomenon, Mr. De Valera directed that the day of the first meeting of the conference should be celebrated by a display of American flags, in significant commemoration of the Declaration of American Independence.

On the 5th Gen. Smuts visited Dublin and had a meeting with the Republican leaders. On the 8th the conference reassembled at the Mansion House, and at its close Mr. De Valera addressed a letter to the Prime Minister accepting his invitation to a conference in London.

*The "Truce."*

At the first Mansion House meeting it had been agreed that it would be impossible to conduct negotiations with any hope of achieving a satisfactory result unless there was a cessation of bloodshed in Ireland, and Mr. Lloyd George had subsequently addressed a letter to Lord Midleton concurring in this view. Gen. Sir Nevil Macready, the British commander-in-chief in Ireland, accordingly attended the second Mansion House conference, with a view to discussing a cessation of hostilities, and as a result of this, on Saturday the 10th, a formal truce was signed on the one part by Gen. Macready and on the other part by Risteard Ua Maolchatha (Richard Mulcahy), chief of the staff of the Irish Republican army. This truce was to take effect as from noon on the following Monday (July 11), so as to allow time for the news of it to be communicated to all parts of the country. In Dublin, where the news was welcomed with universal rejoicing, the suspension of hostilities came into effect at once, the curfew being suspended, and the unarmed soldiers and "black-and-tans" mixing freely with the people. Mr. De Valera had issued a proclamation as President on the 9th calling on all "soldiers and citizens" to observe the strictest self-control and discipline during the truce. It was, however, a question of

curious interest as to how far this direction would be obeyed. If it were not obeyed, it would show that the Sinn Fein Government had no power to come to decisions in the name of the nation; if it were obeyed, it would prove that this Government was responsible for the whole policy of outrage, terrorism and murder by which the extremists had sought to gain their ends.

The signs during the days spent in negotiation were not hopeful; indeed the week-end before the coming into force of the truce was one of the bloodiest on record in Ireland. On July 8 the murder of a constable by Sinn Feiners in Belfast led to serious rioting, in the course of which 14 people were killed and over a hundred wounded, and this rioting continued intermittently for over a week, with further casualties. On the 9th Mr. George B. O'Connor, who had been a Unionist candidate in Dublin, was murdered in Cork, where, on the evening of the same day, four unarmed soldiers were kidnapped and done to death.[1] On the same date three soldiers were killed in an ambush in Castleisland; one was murdered in Doneraile; an R.I.C. sergeant was murdered in Castlerea; and near Clonmel a girl of fifteen was killed by Sinn Feiners in an effort to murder her brother, an ex-soldier. On the 10th a farmer was murdered at Kilbride, Portarlington. On July 7 the *Irish Bulletin* denied the statements made in certain British journals that there had been an "easing-up" on the part of the Crown of its measures of repression since Mr. Lloyd George's letter, and described the "terror" as still "in full blast," and in its issue of the 8th it gave a lurid account of the "war on women and children." Except in Belfast, however, not only the operations of the Crown forces, but Sinn Fein outrages, seem to have ceased from the coming into force of the truce, officers of the British army and the R.I.C. in some cases concerting with officers of the I.R.A. measures for the preservation of order.[2]

Sinn Fein, with its accustomed ability, meanwhile exploited the situation in order to secure foreign support for its claim to independence. On the 9th Mr. De Valera addressed a series of messages to the United States, to France, to Norway and to Denmark, of which the general moral was that, in the event of the coming conferences leading to the satisfaction of Ireland's just demands, "British prestige will be restored, and Young Ireland will live in history as having saved, by its courage and by its steadfastness, the ideals for which millions were led to offer up their lives in the Great War." To impress upon the outside world the nature of this courage and steadfastness the *Irish Bulletin* issued on July 13 a number of "thrilling stories of the Guerrilla War," as a counterblast to "the British Government's ignoble propaganda against the Republican army, the daily descriptions of these unpaid Irish Volunteers as 'murder gangs' and 'hired assassins.'" On the 12th Mr. De Valera travelled to London, accompanied by Mr. Arthur Griffith, Mr. Austin Stack, Mr. R. O. Barton and Mr. Erskine Childers, and on the 14th had his first interview with Mr. Lloyd George. Next day the Prime Minister held a separate conversation with Sir James Craig and other members of the Parliament of Northern Ireland. Sir James Craig returned to Ireland almost at once, and there issued a declaration which showed that he had not budged an inch from the position he had always taken up. To De Valera's talk about self-determination for the whole of Ireland he opposed the accomplished fact of self-determination for Northern Ireland, whose Parliament the King had so recently opened, and pointed out that De Valera himself had acquiesced in this fact by standing as a candidate for the Belfast Parliament. From this position the North had no intention of receding, though it would meet the South at any time on equal terms, and work with her in a spirit of good-will and coöperation.

*De Valera Appeals to the World.*

*Attitude of Ulster.*

[1] They were being "treated" by a friendly publican in celebration of the truce.

[2] The *Irish Bulletin* of July 21 rightly pointed out that this disposed of the legend of a "moderate" and an "extreme" section of Sinn Fein.

De Valera, on the other hand, continued the conversations, and on July 20 Mr. Lloyd George handed to him the proposals of the Government, which were still, however, kept secret from the public till Aug. 15. After a preamble enlarging on the desire of the British people that nothing should "hinder Irish statesmen from joining together to build up an Irish State in free and willing coöperation with the other peoples of the Empire," the document went on to offer to Ireland forthwith "the status of a Dominion," with "complete autonomy in taxation and finance," the right to "maintain her own Courts of Law and Judges, . . . her own military forces for home defence, her own constabulary and her own police," that she should "take over the Irish postal services and all matters relating thereto, education, land, agriculture, mining and minerals, forestry, housing, labour, unemployment, transport, trade, public health, health insurance and the liquor traffic," and "in sum, that she shall exercise all those powers and privileges upon which the autonomy of the self-governing Dominions is based," subject, however, to six conditions, "vital to the welfare and safety of both Great Britain and Ireland, forming as they do the heart of the Commonwealth." The control of the seas round Ireland was to be reserved for the British navy; the Irish territorial force was to be kept "within reasonable limits," to conform in numbers with the military establishment in Great Britain; the Royal Air Force was to have facilities in Ireland for air defence and communications; voluntary recruiting for the Empire forces was to be permitted in Ireland; no protective duties were to be imposed between all parts of the British islands; and Ireland was to assume responsibility for a share of the debt of the United Kingdom and of the liability for war pensions, this share, failing agreement, to be determined by an independent arbitrator appointed from within His Majesty's Dominions. The conditions of settlement on these lines were to be embodied in a treaty ratified by the British and Irish Parliaments, but the settlement must "allow for full recognition of the existing powers and privileges of the Parliament and Government of Northern Ireland, which cannot be abrogated except by their own consent." The British Government would leave Irishmen to determine by negotiations among themselves whether the new powers should be taken over by Ireland as a whole and administered by a single Irish body, or taken over separately by Southern and Northern Ireland, with or without a joint authority to harmonize their common interests. The Government would willingly assist in the negotiations of such a settlement. But they would not consent to any proposals which would kindle civil war in Ireland.

*The Government's Offer.*

On July 22 Mr. De Valera returned to Dublin to consult his colleagues as to the answer to be given to this offer. A meeting of Dail Eireann, by permission of the Government, was convoked for Aug. 16. It was noted, however, that De Valera had taken the position throughout that he was negotiating with Great Britain as the elected head of the Irish republic and on equal terms. To the National University, which had elected him chancellor during his absence, he sent a letter acknowledging this honour done to "the Head of the State." There were ominous signs, too, that Sinn Fein was in no mood for compromise. In the execution of the Government's order for the release of the interned and convicted members of Parliament in order that they might attend the Dail, what the *Irish Bulletin* described as "a disastrous exception" was made in the case of John McKeon (Sean McKeown), a commandant of the Irish Republican army who had been convicted of the murder of a district inspector of the R.I.C. while resisting arrest. This exception was resented by Sinn Fein, and the Government gave way rather than incur a break-down at this part in the negotiations. Mr. De Valera, however, did not wait for the meeting of Dail Eireann before intimating on his own account to Mr. Lloyd George ("on the occasion of our last interview") that his offer was unacceptable; and on Aug. 10 ("having consulted my colleagues") he addressed to the Prime Minister a letter confirming this

*Reply of De Valera.*

judgment. The Government's draft was appreciated and accepted "to the extent that it implies a recognition of Ireland's separate nationhood and her right to self-determination"; but the offer of "Dominion status" was rejected as "illusory" unless the "right to secede" was sufficiently guaranteed. The "independence" of Ireland was claimed "on the basis of moral right"; and Mr. De Valera asserted "for myself and my colleagues our deep conviction that true friendship with England . . . can be obtained and most readily through amicable but absolute separation." The present proposals were such as the Irish people could not be asked to accept, though he would have been ready to recommend "a certain treaty of free association with the British Commonwealth group" if it would secure the allegiance of "the present dissenting minority," or to negotiate treaties about trade, armaments, etc. They were prepared to leave Ireland's share of the national debt to be determined by three arbitrators, one chosen by Ireland, one by Great Britain, and a third by agreement, or, in default, "to be nominated, say, by the President of the United States." The question at issue with "the political minority" (*i.e.* Ulster) was one "for the Irish people themselves to settle," but "we cannot admit the right of the British Government to mutilate our country, either in its own interest or at the call of any section of our population." They did not "contemplate the use of force," however, in bringing Ulster to terms, and if conciliation failed the question might, he suggested, be submitted to "external arbitration."

On Aug. 15 the Government at last published the text of the terms offered to Mr. De Valera on July 20, his reply on Aug. 10, and a rejoinder from Mr. Lloyd George on Aug. 13, together with a letter addressed to De Valera on Aug. 4 by Gen. Smuts advising him to accept the "Dominion status" offered and "to leave Ulster alone for the present" in the sure hope that, sooner or later, economic considerations would lead her to seek union with the rest of Ireland. In Mr. Lloyd George's rejoinder on Aug. 13, he declared emphatically that no right of Ireland to secede from allegiance to the King could be admitted, and no claim that she should negotiate with Britain as a "separate and foreign Power," nor could the relations between Southern and Northern Ireland nor any other question be allowed to be referred to foreign arbitration. He repeated that, if the conditions of the Government's offer were accepted in principle, their application in detail would form material for discussion.

On Aug. 16, Dail Eireann assembled at the Dublin Mansion House. The proceedings, which were conducted according to all the forms of an ordinary parliament, began by the taking by all the members of an oath "to support and defend the Irish Republic and the Government of the Irish Republic." Then followed the address of "President" De Valera, in which he asserted once more the right of Ireland to complete independence, "which could not be realized at the present time in any other way so suitably as through a Republic," and declared it to be impossible to negotiate to any effect with the British Government, because the two parties to the negotiations had no common basis of principle.[1] At the adjourned meeting on the following day he reasserted this attitude yet more uncompromisingly. "We cannot, and we will not," he said, "on behalf of this nation, accept these terms." As for the Six Counties, the Irish Republic would "go a long way in order to satisfy the sentiments of Ulster"; but he insisted that "the minority problem in Ireland had its origin in British policy."[2]

De Valera's attitude caused something like consternation in those circles in England which believed or affected to believe that Sinn Fein might be conciliated by the concession of "Dominion status." English Radical organs like the *Nation*, which had consistently supported Sinn Fein and vilified the police and the soldiers in Ireland, betrayed their discomfiture by efforts to find in De Valera's utterances phrases which might be twisted into an expression of some willingness to compromise.

[1] *Ir. Bull.* v., No. 55, Aug. 17.
[2] *Ir. Bull.* v., No. 56, Aug. 18.

The Northcliffe Press,[3] whose criticisms of the Government had previously done so much to encourage Sinn Fein, enlarged on the far-reaching character of Mr. Lloyd George's offer, and for the first time for about two years warned De Valera that British opinion would not tolerate an Irish Republic. On Aug. 19 the Prime Minister, in the House of Commons, declared that the terms offered to Ireland by the Government had defined the issues more clearly than they had ever been defined before, and that their rejection would be "an unmistakable challenge to the authority of the Crown and the unity of the Empire in the very heart of the Empire." In the House of Lords the Lord Chancellor defended the action of the Government in attempting to reach a settlement, but went still further in warning Sinn Fein that, in the event of a rejection of the offer, Great Britain would be committed to hostilities in Ireland on an unprecedented scale. This declaration by Lord Birkenhead was attacked by a small section of the Liberal Press as provocative, but, in general, British newspapers of all complexions, with surprising unanimity, emphasized the inevitable result of a refusal by Sinn Fein to come to terms. On the other hand the *Irish Bulletin* commented caustically on the contradiction involved in threatening dire consequences in the event of the Irish "declining as 'a free Dominion' to 'join voluntarily' 'a free association' of 'free nations'" (v., No. 57, Aug. 19). The *Bulletin*, indeed, which represented day by day the views of the republican leaders, denied that the British offer was really one of "Dominion status" as understood in the overseas Dominions; and it protested against the publication of Gen. Smuts's letter, the comments contained in which, it argued, were not justified by the actual proposals made by the Government, which implied the "military subjection of Ireland," and were "incompatible with an independent voice in foreign affairs." The rights and privileges of the Dominions, it argued, were all summed up in the right to secede, which "gives them the authentic stamp of freedom; that is, of free choice; self-determination." The *Bulletin* denied, however, that the phrase "the right to secede" was applicable to Ireland, "which can never be said to 'secede' from an authority never acknowledged."[4]

On Aug. 21 Dail Eireann met in secret session in order to agree upon its formal answer to the Government's terms. From all parts of the world came messages urging the Sinn Fein leaders to listen to reason. They were, however, in a singularly difficult position, and therefore, both in order to safeguard themselves and to add weight to whatever decision might be arrived at, they determined to consult those who might be considered more closely in touch with opinion throughout the country than the members of the Dail, who had been elected under the conditions already described. For this purpose the executive council, representing all the district councils of Sinn Fein in Ireland, was summoned to Dublin to sit concurrently with Dail Eireann, and met at the Mansion House on Aug. 24. On Aug. 26 a public session of the Dail was held. At the outset of the proceedings Mr. De Valera announced that, as this was a new Dail, the "Ministry" had resigned. On the motion of Mr. McKeon, Mr. De Valera was next reëlected "President of the Irish Republic," and in this capacity proceeded to nominate

[3] In 1919 *The Times*, departing from its previous policy, had published a scheme of its own, on Home Rule lines, for an Irish settlement.

[4] This claim, frequently repeated by De Valera and others, that Ireland never acknowledged the sovereignty of the Crown, is, of course, quite without foundation either in history or in public law. It was examined, from the point of view both of a historian and a canonist, by Father Walter McDonald, D.D. (d. 1920), Professor of Moral Philosophy in the Roman Catholic College of Maynooth, in his *Some Ethical Questions of Peace and War* (1919). In this, Father McDonald demolished the Sinn Fein position with pitiless logic, his intimate knowledge of Ireland and its history giving his arguments special weight. The book was violently assailed in *The Catholic Times* (No. 22, "Ireland's Plain Rights"), to which Father McDonald replied in a *Postcript in Reply to Certain Criticisms* (1920). For the issues of principle involved in the Sinn Fein claim *see* SELF-DETERMINATION.

a new "Ministry," all of whom were at once elected. The most notable perhaps of the appointments were those of Michael Collins as Secretary for Finance, and Countess Markievicz, a popular figure at Liberty Hall, as Secretary for Labour.

Before the nomination of the new "Ministers" the "President" read the letter addressed by him on the previous day to the Prime Minister, in which he announced the Dail's unanimous rejection of the proposals for a settlement made on behalf of the Government. In this document Mr. De Valera once more enlarged on the principle of self-determination, stigmatizing as fundamentally false "in Ireland's case to speak of her seceding from a partnership she has not accepted, or from an allegiance she has not undertaken to render," and as fundamentally unjust "the claim to subordinate her independence to British strategy." Dail Eireann, he concluded, was willing to appoint representatives to negotiate a peace "on the broad general principle of government by consent of the governed"; the responsibility for a renewal of the conflict would rest upon the Government, if it refused to come to terms on this principle.

The Prime Minister replied, in the name of the Cabinet, on Aug. 26. In a lengthy statement, he declared it to be "playing with phrases" to say that the principle of government by the consent of the governed involved the recognition of the demand to recognize Ireland as a foreign Power. The demand that Ireland should be treated as a separate sovereign Power, with no allegiance to the Crown and no loyalty to the sister nations of the Commonwealth, was one which the most famous national leaders in Irish history, from Grattan to Parnell and Redmond, had always explicitly disowned. In reply to the contention that Ireland had never undertaken to render allegiance to the Crown, Mr. Lloyd George pointed out that for over a hundred years the representatives of Ireland in the Imperial Parliament had, without protest, taken the oath of allegiance. The British Government had offered to Ireland all that O'Connell and Thomas Davis asked, and more; and from all quarters of the world had come nothing but praise for the generosity of their policy. The Government did not believe that the permanent reconciliation of Great Britain and Ireland could ever be attained without a recognition of their physical and historical interdependence, which made complete political and economic separation impossible for both. Pressing this point, Mr. Lloyd George quoted from President Lincoln's first presidential address:—

> Physically speaking we cannot separate. We cannot remove our respective sections from each other, nor build an impassable wall between them. . . . It is impossible, then, to make that intercourse more advantageous or more satisfactory after separation than before. . . . Suppose you go to war, you cannot fight always; and when, after much loss on both sides and no gain on either, you cease fighting, the identical old questions as to terms of intercourse are again upon you.

"I thought I had made it clear," wrote Mr. Lloyd George, "both in my conversations with you and in my two subsequent communications, that we can discuss no settlement which involves a refusal on the part of Ireland to accept our invitation to free, equal and loyal partnership in the British Commonwealth under one Sovereign." He pointed out that action was being taken in various directions[1] which, if continued, would prejudice the truce and must ultimately lead to its termination. While, therefore, he was prepared to make every allowance as to time which would advance the cause of peace, he added that the Government were not prepared to prolong a mere exchange of notes, and that it was essential that some definite and immediate progress should be made towards a basis upon which further negotiations could usefully proceed. They could not proceed unless the essential facts of the situation were recognized and admitted. Mr. De Valera's letter, unfortunately, had shown no progress towards such an understanding.

[1] *e.g.* Reorganization of and recruiting for the I.R.A., and organised attacks by Sinn Feiners in Ulster, aimed at exciting reprisals, which culminated in serious rioting in Belfast.

A second phase of the negotiations between Mr. Lloyd George and Mr. De Valera opened after the definite rejection by Dail Eireann of the British Government's proposals of July 20. Cabinet meetings were held, on the Prime Minister's summons, at Inverness, in order that his holiday in Scotland might not otherwise be interrupted; and eventually, on Sept. 7, they resulted in his sending to Mr. De Valera an invitation to a conference at Inverness for which the date of Sept. 20 was proposed. The basis of the conference was to be, "How the association of Ireland with the community of nations known as the British Empire can best be reconciled with Irish national aspirations"; and the Prime Minister's letter of invitation laid down no other condition than that the British Government could not accept the setting up of an Irish Republic or any repudiation of allegiance to the Crown. On Sept. 14 Mr. De Valera's answer, as agreed to by Dail Eireann, was published, in circumstances distinctly embarrassing to a continuation of the negotiations. In its first paragraph it accepted the invitation, but it then went on aggressively to reaffirm that Ireland had already declared its independence as a sovereign state, and that its representatives would enter into the conference on that basis. This reply had been sent a day or two earlier to Mr. Lloyd George at Inverness by Sinn Fein emissaries, and he had sent word to Mr. De Valera that he was willing to treat it as withdrawn if it were redrafted and an acceptance sent without the latter part, which would make a conference impossible. But this diplomatic suggestion was ignored by Mr. De Valera, who incontinently sent the Sinn Fein reply, as originally communicated, to the press. Once more the negotiations had come to a dead-lock. On Sept. 15 Mr. Lloyd George telegraphed to Mr. De Valera, cancelling his invitation to the proposed conference, on the ground that it was impossible to proceed with it now that Mr. De Valera had insisted on the independence of Ireland as a sovereign state—a point on which the British Government could not give way. At the same time he intimated that, owing to his being unwell, he would take time for consultation with his colleagues before taking further steps. On Sept. 16 Mr. De Valera sent a reply telegram, expressing surprise at the way in which his acceptance of the proposed conference had been received, and saying that his own view was that the negotiators must meet "without prejudice" to the claims made on either side. The inevitable comment on this rejoinder, and one that was generally made, was that, if that was what he had meant, he would have been well-advised to use that phrase, which would have contained no offence, rather than make an aggressive statement which was bound to be offensive. Any lawyer, or experienced negotiator, would have known that "without prejudice" would be harmless.

*First Conference Proposal Fails.*

Up to Sept. 29 the *détente* was maintained, further communications passing meanwhile between Mr. Lloyd George and his colleagues, among whom Lord Birkenhead played an active part in counselling moderation. The British Cabinet then decided to assume that Mr. De Valera had not intended deliberately to wreck their proposal for a conference, and on Sept. 29 a new invitation was sent to him, opening a third phase in the *pourparlers*. After premising that the result of the previous correspondence with regard to a meeting at Inverness was that the British Government could not now accept it as the basis of negotiations, since it might be argued, if they did, that they had recognized the claim made for Irish independence, "which no British Government can accord," Mr. Lloyd George wrote that they were, nevertheless, keenly anxious to make, "in coöperation with your delegates, another determined effort to explore every possibility of settlement by personal discussion." He therefore sent "a fresh invitation to a conference in London on Oct. 11, where we can meet your delegates as spokesmen of the people whom you represent, with a view to ascertaining"—and here the formula of Sept. 7 was repeated—"how the association of Ireland with the community of nations known as the British Empire may best be reconciled with Irish national aspirations." On Sept. 30 Mr. De Valera sent in reply a simple acceptance of

*London Conference Accepted.*

this invitation, merely adding the words, "our respective positions have been stated and understood."

Thus at last the two sides were brought to the council-table, after three months' parley. Mr. De Valera did not include himself among the Sinn Fein delegates, and Dail Eireann nominated for this purpose Mr. Arthur Griffith (in the Gaelic form, Art of Griobhtha), Mr. Michael Collins (Michael O. O. Silcain), Mr. Robert C. Barton (Riobard Bartun), and Mr. George Gavan Duffy (Seorsa Ghabgain ui Dhubhthaigh), with Mr. Erskine Childers as principal secretary. They duly attended in London, and the conference began as arranged on Oct. 11, the British Government being represented by Mr. Lloyd George, Mr. Austen Chamberlain, Lord Birkenhead, Mr. Winston Churchill, Sir L. Worthington-Evans, Sir Gordon Hewart and Sir Hamar Greenwood. For many weeks there were "alarums and excursions" in the press as to the way in which the attempts at a settlement were proceeding; and from time to time, owing to "die-hard" criticisms and objections on both sides, and to the unwillingness of Ulster, as now represented by the Parliament of Northern Ireland and its Premier, Sir James Craig, to waive any point in its own newly acquired status, agreement seemed to be unobtainable. It must suffice here to say that, at last, on Dec. 6, a scheme was found to which both the Sinn Fein delegation and the British Government's representatives were able to affix their signatures. It was in the form of a definite treaty for the establishment of an Irish Free State, and is of such historic importance that its terms must be set out in full:—

*Agreement for Irish Free State.*

Article I.—Ireland shall have the same constitutional status in the community of nations known as the British Empire as the Dominion of Canada, the Commonwealth of Australia, the Dominion of New Zealand and the Union of South Africa, with a Parliament having powers to make laws for the peace, order and good government of Ireland, and an executive responsible to that Parliament, and shall be styled and known as the Irish Free State.

Article II.—Subject to provisions hereinafter set out, the position of the Irish Free State in relation to the Imperial Parliament and Government and otherwise shall be that of the Dominion of Canada, and the law, practice and constitutional usage governing the relationship of the Crown or the representative of the Crown and of the Imperial Parliament to the Dominion of Canada shall govern their relationship to the Irish Free State.

Article III.—The representative of the Crown in Ireland shall be appointed in like manner as the Governor-General of Canada and in accordance with the practice observed in the making of such appointments.

Article IV.—The oath to be taken by members of the Parliament of the Irish Free State shall be in the following form:

"I . . . do solemnly swear true faith and allegiance to the Constitution of the Irish Free State as by law established, and that I will be faithful to H.M. King George V., his heirs and successors by law, in virtue of the common citizenship of Ireland with Great Britain and her adherence to and membership of the group of nations forming the British Commonwealth of Nations."

Article V.—The Irish Free State shall assume liability for the service of the public debt of the United Kingdom as existing at the date hereof and towards the payment of war pensions as existing at that date in such proportion as may be fair and equitable, having regard to any just claims on the part of Ireland by way of set-off or counterclaim, the amount of such sums being determined, in default of agreement, by the arbitration of one or more independent persons being citizens of the British Empire.

Article VI.—Until an arrangement has been made between the British and Irish Governments whereby the Irish Free State undertakes her own coastal defence, the defence by sea of Great Britain and Ireland shall be undertaken by His Majesty's Imperial Forces, but this shall not prevent the construction or maintenance by the Government of the Irish Free State of such vessels as are necessary for the protection of the Revenue or the Fisheries. The foregoing provisions of this article shall be reviewed at a conference of representatives of the British and Irish Governments to be held at the expiration of five years from the date hereof with a view to the undertaking by Ireland of a share in her own coastal defence.

Article VII.—The Government of the Irish Free State shall afford to His Majesty's Imperial Forces (*a*) in time of peace such harbour and other facilities as are indicated in the annex hereto, or such other facilities as may from time to time be agreed between the British Government and the Government of the Irish Free State, and (*b*) in time of war or of strained relations with a Foreign Power such harbour and other facilities as the British Government may require for the purposes of such defence, as aforesaid.

Article VIII.—With a view to securing the observance of the principle of international limitation of armaments, if the Government of the Irish Free State establishes and maintains a military defence force, the establishments thereof shall not exceed in size such proportion of the military establishments maintained in Great Britain as that which the population of Ireland bears to the population of Great Britain.

Article IX.—The ports of Great Britain and the Irish Free State shall be freely open to the ships of the other country on payment of the customary port and other dues.

Article X.—The Government of the Irish Free State agrees to pay fair compensation, on terms not less favourable than those accorded by the Act of 1920, to judges, officials, members of the Police Forces and other Public Servants who are discharged by it or who retire in consequence of the change of government effected in pursuance hereof.

Provided that this agreement shall not apply to members of the Auxiliary Police Force or to persons recruited in Great Britain for the Royal Irish Constabulary during the two years next preceding the date hereof. The British Government will assume responsibility for such compensation or pensions as may be payable to any of these excepted persons.

Article XI.—Until the expiration of one month from the passing of the Act of Parliament for the ratification of this instrument, the powers of the Parliament and the Government of the Irish Free State shall not be exercisable as respects Northern Ireland, and the provisions of the Government of Ireland Act, 1920 shall, so far as they relate to Northern Ireland, remain of full force and effect, and no election shall be held for the return of members to serve in the Parliament of the Irish Free State for constituencies in Northern Ireland unless a resolution is passed by both houses of the Parliament of Northern Ireland in favour of holding such elections before the end of said month.

Article XII.—If before the expiration of the said month an address is presented to His Majesty by both houses of the Parliament of Northern Ireland to that effect, the powers of the Parliament and the Government of the Irish Free State shall no longer extend to Northern Ireland, and the provisions of the Government of Ireland Act, 1920 (including those relating to the Council of Ireland) shall, so far as they relate to Northern Ireland, continue to be of full force and effect, and this instrument shall have effect, subject to the necessary modifications.

Provided, that if such an address is so presented, a commission consisting of three persons, one to be appointed by the Government of the Irish Free State, one to be appointed by the Government of Northern Ireland, and one, who shall be Chairman, to be appointed by the British Government, shall determine in accordance with the wishes of the inhabitants, so far as may be compatible with economic and geographic conditions, the boundaries between Northern Ireland and the rest of Ireland, and for the purposes of the Government of Ireland Act, 1920, and of this instrument, the boundary of Northern Ireland shall be such as may be determined by such Commission.

Article XIII.—For the purpose of the last foregoing article the powers of the Parliament of Southern Ireland under the Government of Ireland Act, 1920, to elect members of the Council of Ireland, shall, after the Parliament of the Irish Free State is constituted, be exercised by that Parliament.

Article XIV.—After the expiration of the said month, if no such address as is mentioned in Article XII. hereof is presented, the Parliament and Government of Northern Ireland shall continue to exercise as respects Northern Ireland the powers conferred on them by the Government of Ireland Act, 1920, but the Parliament and Government of the Irish Free State shall in Northern Ireland have in relation to matters, in respect of which the Parliament of Northern Ireland has not power to make laws under that Act (including matters which, under the said Act, are within the jurisdiction of the Council of Ireland), the same powers as in the rest of Ireland, subject to such other provisions as may be agreed in manner hereinafter appearing.

Article XV.—At any time after the date hereof the Government of Northern Ireland and the Provisional Government of Southern Ireland, hereinafter constituted, may meet for the purpose of discussing the provisions, subject to which the last foregoing article is to operate in the event of no such address as is therein mentioned being presented, and those provisions may include: (*a*) safeguards with regard to patronage in Northern Ireland; (*b*) safeguards with regard to the collection of revenue in Northern Ireland; (*c*) safeguards with regard to import and export duties affecting the trade or industry of Northern Ireland; (*d*) safeguards for minorities in Northern Ireland; (*e*) the settlement of financial relations between Northern Ireland and the Irish Free State; (*f*) the establishment and powers of a local militia in Northern Ireland and the relation of the Defence Forces of the Irish Free State and of Northern Ireland, respectively, and if at any such meeting provisions are agreed to, the same shall have effect as if they were included amongst the provisions subject to which the powers of the Parliament and of the Government of the Irish Free State are to be exercisable in Northern Ireland under Article XIV. hereof.

Article XVI.—Neither the Parliament of the Irish Free State nor the Parliament of Northern Ireland shall make any law so as either directly or indirectly to endow any religion or prohibit or restrict the free exercise thereof or give any preference or impose any dis-

ability on account of religious belief or religious status, or affect prejudicially the right of any child to attend a school receiving public money without attending the religious instruction at the school, or make any discrimination as respects State aid between schools under the management of different religious denominations, or divert from any religious denomination or any educational institution any of its property except for public utility purposes and on payment of compensation.

Article XVII.—By way of provisional arrangement for the administration of Southern Ireland during the interval which must elapse between the date hereof and the constitution of a Parliament and Government of the Irish Free State in accordance therewith, steps shall be taken forthwith for summoning a meeting of Members of Parliament elected for constituencies in Southern Ireland since the passing of the Government of Ireland Act, 1920, and for constituting a provisional Government. And the British Government shall take the steps necessary to transfer to such provisional Government the powers and machinery requisite for the discharge of its duties, provided that every member of such provisional Government shall have signified in writing his or her acceptance of this instrument. But this arrangement shall not continue in force beyond the expiration of twelve months from the date hereof.

Article XVIII.—This instrument shall be submitted forthwith by His Majesty's Government for the approval of Parliament and by the Irish signatories to a meeting summoned for the purpose of the members elected to sit in the House of Commons of Southern Ireland and, if approved, shall be ratified by the necessary legislation.

Signed on behalf of the British delegation:

LLOYD GEORGE. L. WORTHINGTON-EVANS.
AUSTEN CHAMBERLAIN. HAMAR GREENWOOD.
BIRKENHEAD. GORDON HEWART.
WINSTON S. CHURCHILL.

On behalf of the Irish delegation:

ART O GRIOBHTHA (ARTHUR GRIFFITH).
MICHEAL O COILEAIN (MICHAEL COLLINS).
RIOBARD BARTUN (ROBERT C. BARTON).
E. S. DUGAN (EAMON J. DUGGAN).
SEORSA GHABGAIN UI DHUBHTHAIGH (GEORGE GAVAN DUFFY).

Dated the 6th of December, 1921.

ANNEX

An annex was attached to the treaty. Clause 1 specifies that Admiralty property and rights at the dockyard port of Berehaven are to be retained as at present date and the harbour defences and facilities for coastal defence by air at Queenstown, Belfast Lough and Lough Swilly to remain under British care, provision also being made for oil, fuel and storage.

Clause 2 provides that a convention shall be made between the two Governments, to give effect to the following conditions: That submarine cables shall not be landed or wireless stations for communication with places outside of Ireland established, except by agreement with the British Government, that existing cable rights and wireless concessions shall not be withdrawn except by agreement with the British Government, and that the British Government shall be entitled to land additional submarine cables or establish additional wireless stations for communication with places outside of Ireland, that lighthouses, buoys, beacons, &c., shall be maintained by the Irish Government and not be removed or added to except by agreement with the British Government, that war signal stations shall be closed down and left in charge of care and maintenance parties, the Government of the Irish Free State being offered the option of taking them over and working them for commercial purposes, subject to Admiralty inspection, and guaranteeing the upkeep of existing telegraphic communication therewith.

Clause 3 provides that a convention shall be made between the two Governments for the regulation of civil communication by air.

On the announcement being made that the agreement had been signed, the greatest relief was felt on practically all sides. Ulster, it was noted, might "contract out"; and the misgivings of the Ulster leaders about the terms on which the Irish Free State was to be set up were on that account regarded as of minor moment. From all parts of the world, congratulations began to pour in on Mr. Lloyd George. Summonses were at once sent out for Parliament to meet, in order to ratify the treaty; and the Government took immediate action for recognizing its validity by releasing all Sinn Fein prisoners. It was not known till Dec. 8 that there was opposition in the Sinn Fein camp itself. On that day, however, Mr. De Valera issued a "message to the Irish people," disavowing and disapproving of the agreement. It ran as follows:—

***De Valera's Opposition.***

"You have seen in the public press the text of the proposed treaty with Great Britain. The terms of this agreement are in violent conflict with the wishes of the majority of the nation, as expressed freely in successive elections in the past three years. I feel it my duty to inform you immediately that I cannot recommend acceptance of this treaty either to the Dail Eireann or to the country. In this attitude I am supported by the Ministers of Home Affairs (Austin Stack) and of Defence (Charles Burgess). A public session of the Dail Eireann is being summoned for Wednesday (Dec. 14). I ask the people to maintain in the interval the same discipline as heretofore. The members of the Cabinet, though of divided opinions, are prepared to carry on public service as usual. The army, as such, is, of course, not affected by the political situation and continues under the same orders and control.

"The great test of our people has come. Let us face it worthily without bitterness, and above all, without recrimination. There is a definite constitutional way of resolving our political differences. Let us not depart from it, and let the conduct of the Cabinet in this matter be an example to the whole nation."

In spite of this repudiation from Mr. De Valera, the situation was dominated by the fact that the agreement had been signed by all the Sinn Fein delegates to the conference. As the leading Irish plenipotentiary, Mr. Griffith thus became its chief champion.

So far as the British Government was concerned, no time was lost. On Dec. 16 Parliamentary sanction was obtained, after comparatively short debates in both Houses, in which adverse criticism played a very small part, except for a hot denunciation by Lord Carson, in the Lords, of the betrayal of the Unionist cause in Ireland. The fact that Mr. De Valera was hostile to the agreement, and that Dail Eireann had met on Dec. 14 and was starting what seemed likely to be an interminable debate, with rather doubtful prospects, created, however, a somewhat delicate situation for the Government. It was not till Jan. 7 that the discussion in Dail Eireann was at last concluded, Mr. Griffith's motion for the approval of the agreement being carried by a narrow majority of 64 to 57. During the debates a profound gulf was disclosed between Mr. Griffith and his supporters on the one side, chief among whom was Mr. Michael Collins, and Mr. De Valera and the irreconcilable Republicans on the other. Many things were said, indeed, which might seem to bode ill for the future, should the result only be to create opposing factions in the new Irish Free State. Mr. De Valera passionately urged his view that the delegates had had no right to abandon "the republic." Great play was made with the contention that the agreement had been signed "under duress"—the suggestion being that the British Government had finally threatened a renewal of "war" should it not be signed. The fact was entirely ignored that "duress" had been exerted much more from the Sinn Fein side, since it was only the intolerable situation of the past two years that had made English opinion ready to accept "dominion status" for Ireland at all. No "threat" had, in fact, been made except in so far as Mr. Lloyd George had frankly intimated that a break-down in the negotiations, resulting from a refusal of Sinn Fein to accept anything but an independent republic for Ireland, would leave Great Britain no option but to fight. Mr. Griffith, Mr. Collins and their supporters, while anxious to show themselves no less determined than Mr. De Valera to stand for the independence of the Irish Free State, hotly resented the charge that the Sinn Fein delegates were not acting within their mandate. In all parts of Nationalist Ireland, moreover, resolutions were passed in favour of ratification and peace.

***Irish Free State Adopted and Started.***

The final division developed into a theatrical resignation of De Valera as "President," and the reconstitution of the Dail Eireann "Cabinet." On Jan. 10 a further meeting of Dail Eireann was held, at which only Mr. Griffith's 64 supporters attended, and he was unanimously elected "President" in Mr. De Valera's place, an adjournment then being taken till Feb. 14. On Mr. Griffith's summons, the Irish Southern Parliament (under the Home Rule Act of 1920) was convened on Jan. 14, and formally ratified the agreement. A Provisional Government, for the purpose of bringing the new Irish Free State into being, was constituted at the same time, consisting of Mr. Michael Collins, Mr. William Cosgrove, Mr. Eamon J. Duggan, Mr. P. J. Hogan, Mr. Finian Lynch, Mr. Joseph McGrath, Prof. John McNeill, and Mr. Bryan O'Higgins,—Mr. Griffith himself not being included, since he wished to continue for the present to act as the head of the Dail Eireann. With the formation of the Provisional Government, as provided by the agreement, a

start was made at once with the transfer of authority to the new administration; on Jan. 16 Lord Fitzalan, at Dublin Castle, handed over the reins of Government to Mr. Michael Collins, as acting Premier; and the Irish Free State came formally into being.

Here, at a dramatic turn in Irish history, our record breaks off in Jan. 1922. The 19th-century Union had been definitely dissolved. Ireland, under the Act of 1920 or under the Treaty of 1921, had been given self-government. Southern Ireland, under Sinn Fein, had been granted a constitution which put her on practically the same footing as Canada. Northern Ireland, under its separate Government, had, however, declined so far to make common cause with it. The future would have to show how this latest experiment in the loose federalism of the British Empire would succeed.

AUTHORITIES.—Of the vast mass of literature on the Irish question published in 1910–21 very little has any independent critical value. The numerous books or pamphlets written on one or other of its aspects are for the most part useful only as reflecting particular points of view. Subject to this last limitation, it may be said that the Sinn Fein propaganda works are almost wholly useless for purposes of scientific history, and must be used with extreme caution. The Government publications are valuable as "sources," in so far as they either reprint original documents or, as in the case of the Report of the Royal Commission on the Rebellion of 1916, provide evidence of first-hand witnesses under judicial examination. These publications, however, only cover a very small field.

By the courtesy of the Chief Secretary the present writer was given access in 1921 to the unpublished documents in the archives of the Castle, without conditions or censorship of any kind. Among these he found the confidential reports submitted annually by the county inspectors of the R.I.C., and they are of exceptional value for the light they throw on the general conditions of the country and the shifting phases of popular sentiment in the several counties. These reports are printed, together with an annual statistics of crime and other matters with which the police are concerned. In addition to these, the enormous number of unprinted reports on special cases, *dossiers* of the depositions of witnesses, recommendations of particular policies by the police and military authorities, with the departmental comments upon them, and so on, were freely placed at the writer's disposal for the elucidation of particular points.

Of great value, especially as affording some sort of check on the official records, are the Sinn Fein official publications, especially *Sinn Fein* and, later, the *Irish Bulletin*. As a record of Sinn Fein policy and activities they are indispensable, but, as propagandist publications, they must of course be used with caution. As regards the Irish Press it may be said generally that the local newspapers are more valuable as historical material than those published in Dublin, since they throw a more intimate light upon the life of the people.

Of the publications referred to in the text, *Notes from Ireland* needs some comment. This was published monthly, and later every quarter, by the Irish Unionist Alliance. Its intention is, therefore, to present the case from the Unionist point of view. Subject to this caution, its volumes provide an invaluable supply of historical material. It gives a whole series of quotations from speeches and from the Press of all political complexions, which may be relied on as accurate; it also provides in its "Diurnal" a very full chronological record of events. For this record the weekly editions of the more important Irish newspapers, e.g. *The Irish Times*, may also be referred to. A complete collection of all published materials for the recent history of Ireland is preserved at the National Library in Dublin. (W. A. P.)

### IRISH (GAELIC) LANGUAGE AND LITERATURE

The decade following 1910 was a period of much activity in the publication of literature written in the Irish language (see 5.622 *seq.*). This activity took two forms, one the editing of older texts which had never seen the light before, and the other the creation of wholly new works. The Irish Texts Society in London, the learned magazine *Erin* published in Dublin, the *Zeitschrift für celtische Philologie*, published at Halle, the *Revue Celtique* of Paris, and the *Celtic Review* of Edinburgh (which ceased publication after 1915) were the principal media for the publication of the older texts. The Irish Texts Society in especial published a number of handsome volumes, all *editiones principes* of important works, the *Poems* of Dáibhi o Bruadair in three vols., the *Contention of the Bards* in two vols., an ancient Irish book on astronomy, the fourth vol. of Keating's history, the poems of Carolan, an Irish version of the wars of Charlemagne, and some lives of saints. The *Cath Catharda*, an extended Middle Irish version of Lucan's *Pharsalia*, had already been finished by Whitley Stokes in 1909. It was the last work of that great scholar and was published posthumously in Leipzig as one of the *Irische Texte* series. In the following year Kuno Meyer printed his researches into the Finn Saga, with the oldest texts bearing upon it, in the *Proceedings* of the Royal Irish Academy, Todd Lecture series. The same scholar published in the *Preussische Akademie der Wissenschaften* a masterly article on the early Irish poetry of the first half of the seventh century, in 1913. He died in 1919, and in the same year appeared the first half of his work on *Fragments of the Oldest Lyrics of Ireland*. Two other works which have lately appeared are Manus O'Donnel's *Life of Columcille* and O'Clery's recension of the *Book of Conquests*. The first was published in America in a sumptuous volume by the Irish Foundation of Chicago, and edited by Father Kelleher and Miss Schöperle; the second was published by University College, Dublin, and edited by Professors MacNeill and Macalister.

The *Gaelic Journal*, which had been founded in 1882, came to an end in 1906, with the 197th number, and the want of a scholarly magazine dealing with the phases and difficulties of the more modern language was keenly felt. In 1912 T. O'Rahilly started a magazine *Gadelica*, to which he himself was the chief contributor, which reproduced all the best and most scholarly features of the old *Gaelic Journal*. Unfortunately this magazine came to an end in 1913, and nothing of quite the same kind has since taken its place.

Other *editiones principes* of valuable Irish texts published by various scholars are Sean O'Neachtain's *Adventures of Edmund O'Clery*, edited by O'Neachtain; the poems of Pádraigin Hackett, many of which had been wrongly ascribed to the historian Keating, edited by Prof. O'Donoghue; a collection of *One Hundred Ulster Poems* by Morris; the romance of *The Son of the Eagle* by Brian O'Corcorain, who died in 1487, edited by Digby and Lloyd; Art MacCooey's poems, edited by Morris; the poems of John Murphy "na Raithineach," edited by O'Donoghue; *The Maguires of Fermanagh*, an historical tract, edited by Dinneen; *The Flight of the Earls*, edited by Walsh; *The Book of the MacSweeneys*, by the same; and many others. All these works, now for the first time given to the press, have had a considerable effect in directing the eyes of the Irish people to their own past. They showed them what their language was capable of doing, and they stimulated modern writers.

It would be invidious to mention the names of some of these new authors while leaving out others whose claims to mention may be just as good. But the name of the late Canon Peter O'Leary, parish priest of Castlelyons, must be mentioned above all others. Although he began to write late in life, after the rise of the Gaelic League, he produced an amazing number of excellent works, of which his first book, *Séadna*, is nearly sure to live. He wrote another long Irish novel, *Niamh*, about the battle of Clontarf; he retold the old stories of Ireland in several volumes; he translated much of *Don Quixote*, *The Catiline Conspiracy*, the *Imitatio Christi* (of which two other Irish versions have been also printed), the *Fables of Aesop* and other works. He also wrote two volumes of sermons. His great merit is that he was the first to turn his back resolutely upon everything that was bookish and old and unclear, and to turn for his mode of expressing himself to the folk speech of his native county of Cork, which he wrote with a clarity and power that have never been surpassed. How suitable the speech of the people became in his hands to express the whole gamut of the emotions was to many a revelation. He died in 1920, and has left his trace upon the language more deeply than any other writer of his time. Father O'Leary stands for the most representative writer of the Southern half of Ireland. Pádraig O'Conaire (or Conry) would probably be regarded by many in 1921 as the best living writer of the Northern half. No two people could well be more different. Coming from Connemara, he had spent a considerable time in England, and many of his stories, notably the powerful tale called *Exile*, deal with life outside of Ireland. In him we see a determined tramp camping out beneath a tent or the stars, and walking all over the country, stick in hand, or driving a donkey before him with his belongings. Entirely *fin de siècle*, he never resorted to the past for his subject-matter, which he draws wholly from his own experience or imagination. In many ways he reminds the reader of Maupassant.

Of late many stories have been translated from modern European languages into Irish, and these have helped to make the idiom flexible, although they are not original work. Irish literature got a great set-back during the political troubles following the rebellion of 1916. Two monthly magazines which published stories and folklore were burnt, one in Munster and one in Connacht. The Connacht editor was "on the run" in the mountains, and of the joint editors of the Southern paper one was "interned" and the other had his house burned, with all the MSS. which he had spent half a lifetime collecting, and all the songs and music he had taken down from old people, now for the most part dead. Pádraig O'Conaire too had his little hut in the Dublin mountains burnt and several plays destroyed. The most scholarly work, and the latest upon Irish saga literature, is that of Thurneysen published at Halle in 1921, *Die Irische Helden- und Königsage*, a volume of over 700 pages, the first part of which contains a general treatment of the subject and the second the Ulster saga.

It is difficult to say with any certainty how far the Irish language has maintained itself in Ireland since 1910. The action of Dáil Eireann (the "Irish Republican Parliament") in making it the official language of their first meeting, nothing else being spoken on that day, gave it a great lift in popular estimation. Many people might have been noticed, especially young men and women, wearing a gold ring on their dress, in the streets of the bigger cities and towns. This was to show that they spoke Irish and wished to be

addressed in that language. It was observed that many of these people came to a violent end, and the wearing of this ring was consequently to some extent discontinued. Finally it may be said that whilst the reading, writing and speaking of the Irish language have increased very much amongst the cultured classes in the towns, the language, where it is still naturally spoken in the north-west, west and north, has not fared equally well, and it is in many of these places barely holding its own against English. (D. Hy.)

**IRIGOYEN, HIPÓLITO** (1853– ), President of Argentina, was born in Buenos Aires in 1853. He attended private schools, the Colegio Nacional, and for three years the Facultad de Derecho, in Buenos Aires. He early became identified with the activities of the Union Civica (*see* 2.472), of which his uncle, Leandro N. Alem, was a founder, and in 1890 he was in charge of a revolutionary force attacking Buenos Aires. From 1891 to 1909 he was professor of civic instruction in the Universidad de Buenos Aires, and for many years held at the same time a similar chair in the Escuela Normal de Mujeres. On the death of Alem he succeeded him as head of the Radical party, which nominated him president in 1916. On March 12 he was elected president, receiving 152 out of the 298 votes of the Electoral College, and on Oct. 12 was inaugurated as the successor of Dr. Saenz Peña (*see* ARGENTINA). He was the first Radical to hold this office. He possessed considerable wealth and neither as teacher nor president did he accept his salary, but turned it over regularly to the Sociedad de Beneficencia for use in charities.

**IRON AND STEEL** (*see* 14.801*).—Developments in the second decade of the 20th century in iron and steel were improvements in processes and equipment rather than new methods. An increase in the *per capita* consumption, far greater than the remarkable increase of the preceding decade, forced attention to means of securing maximum outputs as well as to the ever-present effort to secure economies. Larger units of manufacture were generally favoured and so-called "duplexing" and "triplexing" were outstanding features in steel-making. The latter part of the decade was marked also by a marvellous growth in popularity of the electric furnace, until at the end of 1920 there were 960 such furnaces in the world for steel-making alone, against 114 in 1910. The World War gave an artificial stimulus in general to plant expansion to meet the demands for ships and shells and resulted in a realignment of national capacity. In the main the following analysis is devoted to the economic side of the evolution of the decade.

*Iron Blast-Furnace Construction.*—Design was influenced by local experience of experts in the different iron-producing districts. Profiles depend on raw materials—quality of coke, nature and concentration of ores. Generally speaking, tendency toward greater bosh and shaft angles continued (bosh angle 75° to 80°; shaft angle 84° to 86°). The size of stack increased only in the districts treating low-grade ore, while with high-grade ore (50% to 62% iron) the 500- to 600-ton-per-day size became the standard and many old furnaces were enlarged. In the Minette district of Europe, where the ore charged contained between 30% and 35% iron, the 200- to 250-ton unit became popular in all new construction. The cubical capacity of a blast furnace range between 40 and 100 cub. ft. per ton of pig-iron blown in 24 hours. Individual parts of blast furnaces received particular attention. The hearth construction became reënforced and often cooled to avoid breakouts of the molten metal, and greater attention was given to brickwork to limit the downward destructive action of the metal. Emergency tuyeres at mid-height of the bosh—standard in the Minette district—lost their popularity and disappeared in nearly all new furnaces. For the handling of the material—ore, limestone and coke—mechanical devices won increased favour owing to the enormous masses involved and to the growing scarcity of labour. In America the simple skip hoist was almost universally adopted in new plants, while in Europe the drop-bottom-bucket hoist became popular and its design was ingeniously varied. It is noteworthy that the drop-bottom bucket, which was originated in America (Duquesne works) and was perfected in Germany during the years 1905–10, was little used in the United States 10 years later. It had been supplanted by the cup-and-cone top with a rotary distributor (McKee), while in Europe the double cup-and-cone construction, giving low drop height and assuring less breakage of the softer coke, was preferred. These two solutions were more or less linked to the hoist system adopted. The furnace interiors were bricked up in America of standard-shaped refractories giving a multitude of joints, while it was customary all over Europe to use special large-volume brick, shaped to reduce the joints. Both systems seemed to give satisfaction to the operators, and comparisons were not possible owing to the difference in the operating conditions. Speaking generally, the American design with a plate lining involved less steel for construction, while the Luxemburg-Lorraine type of blast furnace was conservative and substantial.

*Blast-Furnace Operation.*—General progress was marked; greater familiarity with the chemical problems and increased mechanical equipment made operation more easily controllable, results more positive and disturbances less frequent. The use of excessively fine ore was accompanied by a high-solution loss of coke, and agglomerating of ore was recognized as desirable. This led to increasing attention to sintering fine ore mixed with flue-dust, and recharging of dust without treatment seemed likely to die out. Higher temperature of the air blast was a noteworthy development, as each increase of 200° F. has been reflected by 4% to 5% reduction in coke consumption. In the Minette district 850° to 900° F. blast temperatures were quite common. The blast pressure, which remained without much change, varied according to districts and the forcing of the operation, from 4 to 15 lb. per square inch. In case of a relatively cold spell within the furnace due to overfluxing, bad coke or dropping of a hanging, the introduction of kerosene (paraffin) through the tuyeres proved a quick remedy, although it necessarily required care and progressive application to avoid accidents. The use of this cure rendered superfluous the auxiliary tuyeres at mid-height of bosh. The use of the oxygen torch to burn out the iron notch in case of metallic incrustations extremely difficult to remove proved a great help to the working crews. Mechanical appliances in cast-houses were installed in increasing numbers to supplant hand work, especially in sand casting floors. Cranes equipped with lifting magnets and pneumatic hammers elastically suspended proved a step toward the best method of moulding, breaking and handling of sand-cast pig-iron. For all qualities of pig-iron the continuous casting machines continued to be the accepted standard. In plants adjoining steel-works transport ladles of larger size (30 to 50 tons) and designs assuring better insulation and easier skimming of slag were evolved.

*Blast-Furnace Gas.*—Continuously increasing price of coal and coke affected the economics of the blast-furnace gas and made it a by-product of great importance. The fuel value of this original waste became more and more recognized in America. The first effort, to avoid all gas losses so far as possible, led to the installation of double furnace tops, which became universal. Next gas-cleaning processes were developed to remove dust impurities from the by-product fuel, thus increasing its adaptability to combustion and securing greater efficiencies in its utilization. To facilitate operation and render supervision automatic, pressure-regulating devices were evolved and accumulators were installed to equalize supply and provide steady outflow. Gas-cleaning attracted the attention of operators in European countries greatly in need of fuel, because the calorific value of the gas counterbalanced the cost of purification. In America the coal shortage, due to inordinate demand and dislocation of railway service, produced the same result. The first step in gas-cleaning was the installation of a dust collector close to the off-takes and the downcomers of each blast furnace. In it the coarse dust was deposited by a slowing-down of the gas flow and a sudden change in its direction. This apparatus was independent of all further cleaning methods.

To separate the fine dust particles two different processes were applied: (1) wet method; (2) dry filtration.

(1) By the wet method the gases were cooled by injection of water, and the dust particles, passing through the fog artificially produced, were arrested by scrubbers. Experience led to a subdivi-

** These figures indicate the volume and page number of the previous article.*

sion of the operations, called medium cleaning and fine cleaning, with apparatus protected by patents. The sludge of dust and water was removed by the application of centrifugal force, separating gas and liquid in specially designed fans or washers (Theissen, Brassert, etc.). The disposal of the water created a problem, as contamination of rivers is against the law in most industrial countries. In deposit ponds the settling of the impurities was incomplete and its removal a tedious manual operation; and the Dorr thickener, developed in ore-concentration districts, was adopted, as assuring continuous service automatically by means of a special mud pump requiring little attention. A drawback of wet systems was that the sensible heat of the blast-furnace gas was absorbed by the cleaning water and lost beyond recovery. On the other hand, it permitted the installation of smaller gas-piping and dispensed with the insulation of the lines against heat loss, thus saving appreciable capital outlay in the case of long-distance distribution. Another drawback of the wet method was that recovery of the dust required driving off the water from the heavy mud in any briquetting or concentrating process attempted.

(2) The dry methods of gas-cleaning had their advocates where every little economy was watched, such as retaining the sensible heat of the gas and saving the expense of water-handling in keeping the dust dry. To separate the dust out of the hot gases, filtration appeared to be the best process. With mechanical filtration, finely woven cloth or asbestos-fabric bags or slag-wool layers let the gas pass at low velocity but retained the solid dust, which was removed periodically by return currents of clean gas. The principle was adopted in the Beth-Halberg system in Europe and the Kling-Weidlein apparatus in the United States.

Through the researches of Dr. F. G. Cottrell, in the United States, electricity promised to serve as a filtering medium in the so-called electric precipitation process. By creating high-tension discharge currents in the flow of the gas the solid particles became separated from the gas. At the end of the decade 1910–20 high potential electric deposition had its noteworthy applications among non-ferrous blast-furnace installations. The utilization of the thermal value of blast-furnace gas was sometimes credited against the conversion cost of ore, plus limestone, plus coke, into pig-iron. A ton of iron blown, requiring 2,200 lb. of coke of about 80% pure carbon (equal to 1,700 lb.), produced an amount of gas, expressed in cub. ft., equal to 90 to 100 times that weight, or some 160,000 cub. ft., averaging about 100 B.T.U. per cub. ft. In assuming a value of 2 cents or 1d. per 1,000 cub. ft., the gas would represent an asset of some $3.20, or 13s. to 14s., per ton, a figure indicating the great importance of the by-product gas in the cost-sheet of the plant. The gross valuation must be diminished by such factors as the cost of cleaning, but a net surplus of about $1 per ton per day was not uncommonly left after allowing for material and conversion outlays of the plant.

The chief ways in which blast-furnace gases were utilized were as follows:—

(*a*) *Cowper or Hot-Blast Stoves.*—The absence of dust in the gas provided for rational stove design, as the complicating side issues of clogged-up passes and slagged-up checker holes disappeared, as well as the periodic waste of cooling, cleaning and warming-up of each unit. The clean gas meant a reduction of the area of heating surfaces and brick volume expressed by fewer stoves per blast furnace—three to four per furnace against four to five 10 years earlier. Then began a systematic study of the heat-transmission phenomena within the mass of checker work, a study which in 1920 was not yet completed. Close observation and scientific research, coupled with improved combustion methods regulating more closely and more positively the two elements of combustion—gas and air,—promised at that time to lead to a further reduction of the number of stoves, and also to higher blast temperatures and less gas consumption.

(*b*) *Boilers.*—Clean blast-furnace gas allowed for advantageous use in connexion with steam boilers; first, through more efficient combustion, in effect less gas per pound of steam produced; second, higher ratings of boilers, in effect more steam per unit of boiler evaporating surface or fewer boilers for a given plant capacity; and, third, quick adaptation to any load required, in effect flexibility or ease of operation. Many efficient burners were invented and some were installed on a large scale.

(*c*) *Metallurgical Furnaces.*—The removal of flue-dust made possible a wider distribution of the blast-furnace gas, and in Europe use was made of the surplus gas with success in all kinds of furnaces. The low calorific value coupled with the small amount of air required for complete combustion opened fields where so-called mellow heating flames are demanded, such as core drying, mould drying, annealing, roasting and ore concentrating.

(*d*) *Gas Engines.*—The principle that clean gas was indispensable for internal-combustion engines was long recognized, but its practical application did not occur until after 1910. Also a cool gas was regarded as essential to secure adequate volumetric efficiency of each cylinder. Among gas engines the four-cycle type outranked considerably the two-cycle type. Devices for close regulation were developed on the principle of qualitative-quantitative mixture. The built-up cylinder seemed to win greater favour than the one-piece casting. The safety of operation reached a parity with that of steam-engines or turbines, the gas being clean. The exhaust heat of the engines, representing some 40% of the energy, was utilized to generate steam, and 70% was thus recovered in some instances.

Of all the various uses made of the gaseous by-products of the blast furnace only the heating of the hot-blast stoves was universally applied. All experts agreed that 30% to 40% of the gases are best employed for that purpose. The surplus of 60% to 65% was utilized for the other purposes already mentioned. In the utilization to produce blast pressure and to develop power, the battle for supremacy between the gas-engine using blast-furnace gas and the steam boiler using the gas to supply energy to engine or turbine remained undecided. Thermal efficiencies were not the only issues at stake. In Europe the gas-engine had the firmer standing, while in America the boiler seemed to be the more in favour. Even for generating the blast pressures, the competition between gas-engine-driven air compressors, steam-engine blowing engines and turbo-blowers had gone on without absolutely proving the superiority of any one combination. Varying economic conditions in each country and different local considerations, as well as the purely technical aspects of the problem, were deciding factors. Europe, with its skilled workmen and more stabilized market conditions, presented a background different from that of America with its fluid trade conditions and its unsettled, unskilled labour.

The fact that the dust in blast-furnace gas is made up of coke, ore and flux additions, combined with the fact that the cleaning plants provide for collecting it, led to the reintroduction of the material into the furnaces. By previous nodulization, as in rotary kilns, or briquetting under presses with or without binding agent, the flue-dust became available for use. Numerous processes were developed, of which the Dwight-Lloyd sintering system gave good results, judging from the number of installations in America.

*Plant Layout and Size.*—A single blast furnace built alone on a site, no matter how well chosen, proved not to be a logical industrial enterprise. The number of such plants existing was the result of competition, of fluctuating market conditions, and constituted an economic waste, speaking generally. With combined units the accessory equipment became cheaper in installation cost and in terms of iron output and more efficient in operation, through flexibility and insurance against breakdown. Three to six furnaces grouped in well-laid-out plants were established as an economic whole. To avoid the loss of the sensible heat of the molten pig-iron and to refine the metal without cooling, steel-works were logically joined to blast-furnace plants. The two separate departments were thus combined in one industrial unit, with the added advantage that the surplus of power available at the furnaces could be absorbed in the rolling-mills.

*Electric Pig-Iron Furnaces.*—Tests at Trollhättan, Sweden, made on a coöperative basis by steel interests and the Government, were conclusive only for high-grade pig-iron similar to the Swedish charcoal pig-iron. Since 1918 the Domnarfret works in Sweden had operated several shaft-type furnaces (with gas circulation using 60% to 62% of iron ore and charcoal as a reducing agent). Mixtures of charcoal and coke up to 50% coke were found satisfactory. Per ton of pig-iron produced, 3,400 lb. of ore (containing 61·5% Fe), 120 lb. of lime and 740 lb. of charcoal were charged; 15,000 cub. ft. of gas at 240 B.T.U. per cub. ft. were captured at the top; 2,150 kilowatt-hours was the electric energy consumption per 2,000 lb. of pig-iron. The problem of using electric current for supplying heat in the blast-furnace reactions had particular interest for the eastern Pyrenees in France, British Columbia, Brazil, Italy, as well as Sweden and Norway, where fuel is scarce and low-priced electricity might be made available.

*The Steel Plant.*—The usefulness of mixers as an important adjunct of the steel-making plant was universally recognized, as numerous installations attest. Their field was established in equalizing qualitatively the successive outgivings of the blast furnaces and in desulphurizing the molten metal. To accelerate the removal of sulphur, less than 0·5% of manganese proved most helpful. The shape of the mixer that gave best results was the simple cylinder rotating on its axis. The most popular size proved to be 1,000 to 1,400 tons' containing capacity. Simple oil or gas burners without regenerating chamber in the United States, with pre-heating checkers sometimes in Europe, completed the equipment. In Germany a 2,000-ton-capacity mixer was reported built, but only after considerable discussion as to its size. The mixer was, of course, brought into being for receiving metal from the blast furnace and delivering to the ladle for transport to the steel plant as needed. Slag that floats on the top of the bath must be skimmed off from time to time.

*Converter Plants.*—No noteworthy development took place in the acid operating (Bessemer) converter or in the basic operating (Thomas) converter for making steel. The 20- to 25-ton-capacity vessel remained nearly universal. A 40-ton size was proposed in 1918 by a Belgian engineer. As between Europe and the United States, the hydraulic tilting mechanism of the former did not give way to the electric drive of the latter, nor did the gas-engine blowing units succumb to the turbo-blowers of American practice.

*Open-Hearth Plants.*—Without radical change in type, sizes of open-hearth furnaces increased up to and above 100 tons' capacity, but the tendency was toward fully controllable sizes. The practice in the United States settled to 80 to 100 tons and in Europe 40 to 50 tons. Volumes of checker chamber increased to get better so-called flywheel effect. Greater attention was paid to port and head construction to lengthen life, and to a reinforced roof. Reversing valves

were marketed for reducing flow resistance and waste of gas. Waste-heat boilers were more generally installed, but not universally adopted because of their interference with concentration and general electrification of plants. Marked superiority or inferiority was not shown for the tilting construction of furnace when tested by use beside the stationary type. Natural gas disappearing in America, producer gas was the more generally adopted fuel. Powdered coal was tried with some success but without proved superiority; one difficulty was that checker chambers got clogged by ashdust. By-product tar and crude oil proved fuels well suited for the purpose if available at low price and in large quantities.

*Electric Steel Furnaces.*—The electric steel furnace for refining and melting iron and steel developed to a surprising extent in the decade 1910–20 in size and in number of installations. It proved ideally suited for quality products and high-grade materials, because no complication through fuel medium exists and because atmosphere and temperature are attainable practically at will. From 500-lb. capacity, single furnaces were built to 40 tons, with most of them of 5- to 8-ton capacities. (For electric furnace statistics, see *Iron Age*, Jan. 1 1921.) Of the 960 known electric steel furnaces in existence in Jan. 1921, 356 were in the United States, 150 in England, 100 in Germany, 69 in France and 43 in Canada. Of the total, 308 were Héroult arc furnaces, 102 Rennerfelt induction furnaces and 90 Greaves-Etchells furnaces. The electric furnace was adopted for making metal mixtures, ferro-alloys, special steels of high quality in large amounts—strict repetition being possible in an absolute positive way. A disadvantage was that the metal is not at rest but always in motion, through electric or magnetic influences. Though agitation was often desirable, the action hampered the separation of the slag and the rising of impurities out of the molten mass. A remedy for this was repeated skimming of slag and careful supervision. One unusual utilization of the electric furnace was the making of pig-iron out of scrap, especially in the United States, to supply deficiencies in the amount of low phosphorus pig-iron, particularly in the manufacture of ordnance. It amounted to a synthetic reconversion of steel into pig-iron. Fine coke was added to the slagged refined scrap for carburization, and the method promised to be commercially feasible in regions having electric power but little local fuel available and situated so that delivered pig-iron was high in price. For deoxidation in the refining process and for recarburization, ferromanganese and spiegeleisen retained their popularity in spite of high prices under erratic market conditions. In Europe pre-heating, often pre-melting, of the addition was the current practice, to save in the amount needed and to accelerate effects. In America the wasteful method of cold additions prevailed. Ferrotitanium, with carbon or carbon-free, was used, as well as ferrosilicon and aluminium in small quantities. Some steel plants made additions in the ladle, others finished the operation in the furnace.

*Steel-making Operations.*—The outstanding feature of steel-making operations was the recognition of splitting the refining process into two phases, or the two-slag method, to increase production and to lower production costs. The efforts of Bertrand-Thiel and Talbot recognized in effect this principle; and duplexing and triplexing were only operating variations of the same principle, to remove the impurities of the pig-iron stepwise in the furnaces best suited for each purpose. Thus sulphur and manganese pass out in the mixer; silicon and part of the carbon in the converter; the rest of the carbon and phosphorus in the open-hearth furnace; additions were made and alloys were added in the electric furnace. The plant necessitated considerable equipment, but it secured ease of operation, exact control of results and made possible quantity production. Below 1,600 tons per 24 hours, savings in operation were regarded as hardly possible, as in slack market periods overhead expense was too large. During the World War about 10 duplexing plants, refining in an acid converter and finishing in basic open-hearth furnaces, were built in the United States under the pressure created by an ammunition famine. Electric duplexing plants (meaning melting and preparing in open-hearth furnaces and finishing in electric furnaces) were built in large numbers, offering a special-quality product on a large scale.

A number of new independent efforts were made to produce steel direct from the ore without the interpolation of the iron blast furnace, but none could be said to have been proved feasible on a scale beyond that of the laboratory.

The problem of casting crude steel, particularly the ingot problem, received close study. The mould may be stationary, located in pits, or put on railway bogies moved on tracks by locomotives. Both systems have their field, the former being more suited for small plants. The sizes of the ingots varied from 1,000 lb. to 6 tons. In America 6,000-lb. and 8,000-lb. ingots were in wide use, while in Europe 4,000-kgm. to 5,000-kgm. sizes were adopted in large up-to-date plants. To facilitate the stripping operation, that is the separation of mould from ingot, about 80% of moulds were made slightly conical with top smaller than bottom. Most of the pouring was done direct into the mould from the ladle, some by attaching to the ladle a little dished pan to break the jet and to produce a quiet overflow pouring, while in another class the metal flowed upward from the bottom by means of a special riser connecting through refractory channels with the several moulds. About 20% of the steel-makers used the conical mould that is larger at the top than at the bottom, and in some cases a refractory or heated top was placed on top of the mould to secure better results; these moulds require a tilting-over to allow for the stripping. All these mould forms were evolved by the study of the cooling of steel in ingot form and the defects occurring in the metal—the volume shrinkage due to change of physical state from liquid to solid; cooling by strata; crystallization and segregation phenomena; inclusion of solid and gaseous impurities, called blowholes, piping, sonims, etc. One type of ingot mould which was well received in America provided a bulk of metal in the lower part, thus to absorb more heat from the lower strata of the molten steel and leave the upper ones as the last to freeze or solidify and afford an opportunity for the segregation of gaseous and solid impurities.

*The Shaping of Steel.*—Rolling-mills (used if the demand for a product is large and if its shape lends itself to a continuous process, like rails, angles, plates, bars, etc.) and the forge-shop (if the shapes to be produced are complicated, short in length, unsuited for the rolling-mill), both change the shape of the metal heated at high temperature, about 2,000° to 2,300° F. Both require finishing departments to straighten, shear or bundle the rolled product or to clean off the fins, rough off the unevenness of the forging operations, and they may need annealing and pickling facilities to improve the quality of the product. A special process of milling the top and bottom of rail blooms, to remove cracks and roughness from the semi-finished steel and also surfaces decarbonized in the heating furnaces, was put into use at the Lackawanna mills in America and resulted in a reduction in the number of finished rails classed as seconds.

In the period 1908–20 the development of the rolling-mill was influenced, first, by the great manufacturing principles of concentration and specialization, and, second, by the electrification of the motive power. Concentration demanded large production in one unit and suitable equipment to attain that aim; in other words, mechanical devices in preference to hand operation. Specialization was applied to the shape to be rolled as well as to the mill used for production. Standardization of rails, beams, and angles, the reduction of the number of profiles, and the simplification of shapes were consequences, as well as the installation of mills for specific purposes. The application of these rational principles was accelerated by the use of the electric motor. The advantages were recognized about 1905, but the next 15 years brought their practical realization. The numerous little steam-engines disappeared and the electric motor revolutionized the handling of the material by cranes and overhead trolleys as well as the mill accessories, like tables, skids, transfers, etc. The first step was the creation of central power plants where electricity was generated either in turbine or gas-engine generators, preferably with the help of the surplus gas from the blast furnace. Many steel plants in 1920 were equipped with 20,000- to 40,000-K.W. power stations. The second step was the development of speed-reducing devices made necessary by the high speed of electric motors. The advance of the gear-cutting industry and the advent of spiral-type teeth, single or herringbone, and the development of new types of teeth giving less wear, more rolling surface, and, later, the use of special hardened, heat-treated steels were eagerly taken up by the designers of mill machinery to increase the quality of their product. Reduction gears transmitting up to 5,000 H. P. came into daily use, and the ratio of 10 or 12 to 1 in one reduction gave satisfactory service. The third step was the development of speed-regulating devices, especially in connexion with alternating-current motors, to secure efficient operation for variable conditions. The fourth step was the solving of the load problem of large, intermittently operating motors, reversing their direction of rotation by means of the motor-flywheel set advocated by the Austrian engineer Ilgner in connexion with suitable controllers of which the Ward-Leonard system was the prototype. Much work and inventive genius were concentrated on these difficulties to bring about in less than 15 years the high efficiency and great safety of operation by electricity of steel-mills. The development of the rolling-mills by 1921 is shown in the diagram.

A rolling-mill proper consists of its motor (steam-engine or electric motor), a universal coupling (speed-reducing drive or not), pinion stand transmitting power to all rolls by means of toothed pinions, together with spindles and couplings, and one or more roll stands solidly bolted to foundation shoes. A roll stand has two housings with adjusting mechanism and is fitted with two or three rolls and called either two-high or three-high, according to the number of rolls. But rolling-mills bear various other designations that are confusing. Sometimes they are characterized by their roll diameter (a 20-in. mill or a 35-in. mill); sometimes they are called after their inventor (Mannesmann mill, Lamberton mill); sometimes they get their name from the product (blooming-mill, plate-mill, wire-mill); sometimes their direction of operation is judged most important and then they are called reversing or non-reversing mills. Slabbing-mills are large mills with two horizontal rolls of 30- to 40-in. diameter and two vertical rolls of 24- to 32-in. diameter, built to roll slabs, which have a rectangular section. They roll the four sides of the slab without the need of handling or tilting. They are expensive in installation, requiring two reversing motors developing 15,000 and 10,000 H.P. respectively. They are seldom provided for in new plants (perhaps the latest installation being that in the Gary plant, Indiana, 1910) and were superseded either by universal-mills or blooming-mills. Blooming-mills have two horizontal rolls of 24- to 40-in. diameter, mostly of the reversing type equipment, with manipulators for the mechanical turning-over of the ingot, and side-

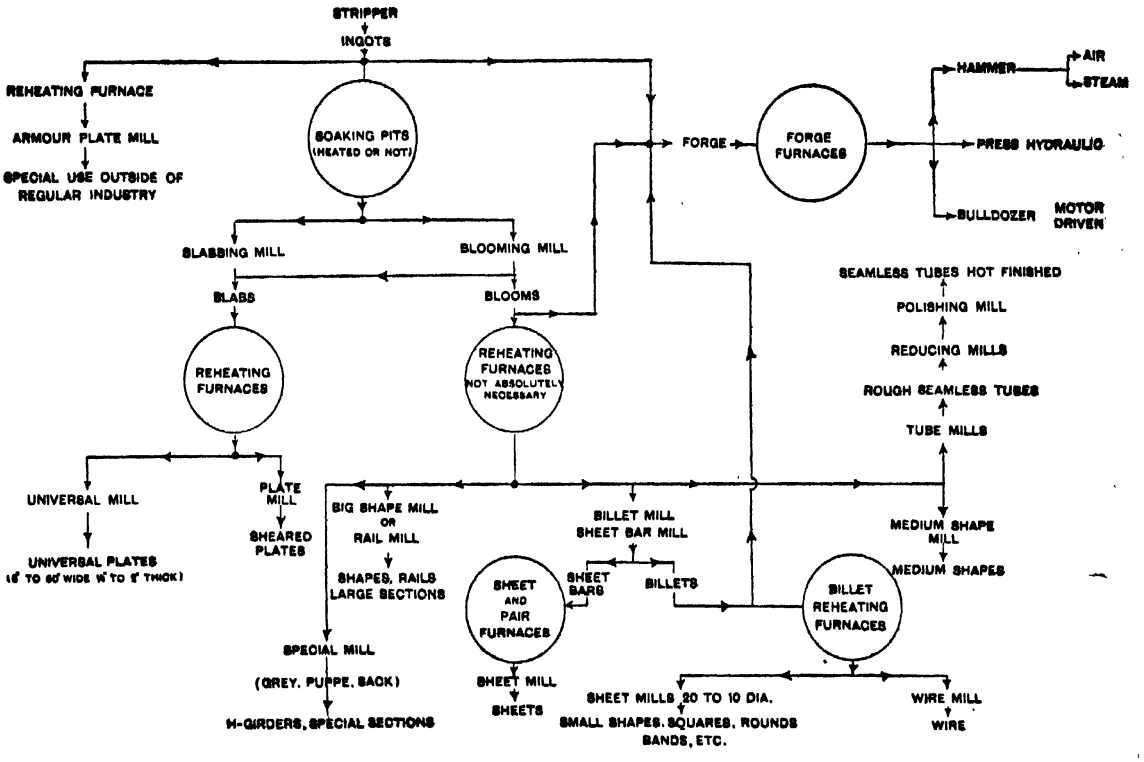

FIG. 1.—Steps in the Process of Making Various Forms of Steel.

guards; they roll either blooms or slabs. Plate-mills carry cylindrical rolls to produce sheared plates (or plates which are subsequently sheared to required width), but may have in addition two sets of vertical rolls driven from the main pinion housing, to produce universal plates which require no shearing, both sides of the slabs being rolled. Both forms may be of the three-high continuous running or the two-high reversing type. Their roll diameters are 24 up to 42 in. The three-high or Fritz form of plate-mill is often called the Lauth type and is characterized by the fact that the middle roll is smaller and not direct-driven, but rotated by friction from the upper or lower roll. For large blooming-mills preference for the reversing drive was shown in the decade 1910–20. Three-high blooming-mills were seldom built in the larger units because of clumsy accessories. For the heavy plate-mills, also, the two-high reversing type was preferred. For small knocking-down or cogging-mills and the smaller plate-mills, the two types were in competition, with no apparent superiority of either system.

For driving continuous mills electricity was preferred to the steam-engine. The uniflow steam-engine found favour up to 3,000-H.P. units, but installations were few. Where the effort was to bring about a complete electrification of the plant, steam-engines proved unpopular, possible economy being counterbalanced by complication of maintenance and other administrative considerations. For the reversing drive of large units, requiring loads up to 20,000 or 25,000 H.P., the electrical drive was not necessarily in the ascendency. The high initial cost of the motor generator flywheel set with direct-current motor directly connected to pinion and mill was made the chief argument against universal adoption of electricity, and numbers of old plants were reluctant to change their somewhat obsolete steam equipment. In America only a few engines as large as 25,000 to 30,000 H.P. (Weirton and Lukens) were installed in new work, and in England large vertical engines were built. The electrical units, however, increased considerably in number and size and considerable progress was realized in the matter of manœuvring capacity, in standardization of winding and accessories, in records of output and efficiency of running. In 1920 the electrical industry was aggressively working on betterments, while the partisans of the steam-engine rested on past laurels. Parity existed on all points except first cost of installation. Even for smaller mills of the reversing type electrical drives were built, such as 24-in. mill (Mark, Indiana Harbor), 26-in. mill (Atlanta, Ga.). Two-high reversing plate-mills also disputed the field with the three-high type in the medium-sized equipment, and latest universal-mill installations were of the reversing type electrically driven. The largest mill for plates, 192 in. wide, at Lukens, Pa., which was completed in 1918, was of special design, reversing, and steam-driven. (*Iron Age*, Jan. 2 1919.)

In shape, billet and smaller mills no revolutionary change was made. In shape- or rail-mills great subdivision of rolling-passes into individually driven stands proved to be an exaggeration, and later installations concentrated the drives. The use of a second reversing roughing-mill, however, bade fair to become standard, in relieving the burden of the first blooming-mill and in preparing quickly for the finishing stands. Billet and sheet-bar mills, usually of the continuous type, were standardized into two units, the 24-in. mill of four to six stands and the 21-in. mill of six stands. Patented mills for special beam shapes having wide flanges were built under Grey patents in Differdange, Luxemburg, in 1904, and in Bethlehem, Pa., 1908 and 1915, and under Puppe patents in Peine, Germany, in 1914, and Sack patents in Rombach, Lorraine, in 1912. Mechanical solutions of the reversing problem were attempted by the Lamberton mill or the Fawell mill but were not put into any wide use. Sheet-mill construction changed little except that the electric drive became universal. The design with two overhung flywheels on pinion shaft proved efficient and final. The reduction ratio showed a tendency to increase from 8 to 1 to 12 to 1.

| | | Billets (in.) 5x5 to 2x2 | Bars (in.) below 1½x1½ |
|---|---|---|---|
| Bloom ingots (in.) 12x12 to 24x24 | Blooms (in.) 6x6 to 12x12 | Sheet bars (in.) 15x2 to 8x½ | |
| Slab ingots (in.) 20x8 to 40x16 | Slabs (in.) 10x3 to 36x10 | Plates up to 190 in. wide | |

The concentration of production in large well-balanced plants with adequate resources and sales organization permitted a logical subdivision of the rolling-mill programme with a subsequent reduction of production cost. The smallest bloom section, 6x6 in., had a tendency to grow toward 8x8 in., as some experts claimed that 50 sq. in. was the economic limit of the range of a large mill. To reduce the time required for roll changing, complete spare housings, completely mounted, came to be good mill practice, these being dropped on the shoeplates by the cranes. In some specialty plants sometimes two or three housings were changed together.

*Furnaces.*—The development of soaking, reheating and annealing furnaces was influenced by the increasing price of fuel and considerable efforts were made to boost heating efficiencies. In Europe gas-firing with recuperation and regeneration of waste heat was the favourite, especially because producer-gas firing was much used and remarkable results achieved. In America continuing shortage of natural gas for industrial purposes in regions such as the Pittsburgh district made a substitute market for crude oils, coke-oven gas and powdered coal. Especially since 1915, the use of powdered coal developed to a surprising degree for all kinds of metal-heating appli-

*Estimated.

cations. Mechanical stokers were evolved in numerous designs to dispense with hand labour and to control by mechanical contrivances the combustion of coal in an efficient way.

*Mill Equipment.*—Roller tables, skids, transfers, cooling-beds and tilters were perfected and installed in increasing numbers owing mainly to the efficiency and handiness of electric motors. Variable-speed drives gained in favour. Straighteners, saws, punches and shears were made in conformity with the availability of electric power. Hydraulic devices were pushed in the background and electric drives supplanted engines in the field of these mill accessories.

*Metallographic Progress.*—Metallographic knowledge spread in the decade 1910–20 from the university laboratory to the steel-mill, outgrowing the narrow circle of students to become the helpmate of the operator. Pyrometers or temperature recorders and the scientific control of temperature came as a matter of course in numbers of steel-mills. The variety of alloy steels offered for practical uses was due to the theoretical investigations of the metallograph. Chromium and vanadium, nickel and cobalt, tungsten and molybdenum added their special properties to steel, and improved heat-treating methods enhanced these qualities with a skill and positiveness hitherto unknown.

Beyond the realm of iron and steel making, properly regarded, but coming within the purview of the industry, the remarkable development of the second decade of the 20th century was the heat treatment of metals. It went hand-in-hand with the study (by means of the microscope, and thus of the photomicrograph) of grain structure and the transformations which take place in the so-called solid solutions, according to the degree of heating and cooling given to the metal. Practical applications of the investigations of the scientist were numerous, and the history of the temperature experience of a given metal product going into an article of commerce was accepted as every bit as important as the chemical constituents, for two pieces of steel, identical chemically, may be made to behave physically very differently according to their crystalline state.

Other developments which must be briefly enumerated were: Efforts to test a material's fitness or agreement to specifications without destroying it, as by X-ray photographs (sheets), or by magnetic analysis (by noting changes in permeability of an article of constant cross-section, as a rifle-barrel, wire or steel rail, by moving it through a magnetic field); these, however, were not definitely of commercial dependence, pending further investigation; success in making large chains of cast-steel links followed by heat treatment, such as annealing; efforts to cast in centrifugal moulds, such as cast-iron pipe by introducing molten iron into the rotating mould; commercial recovery of potash from blast-furnace flue-dust deposits at the base of hot stoves finding a market; making iron pipe by an electrolytic process of depositing iron on a rotating cathode in a ferrous-chloride electrolyte; commercial manufacture of a stainless steel having 10% to 15% of chromium, which, Harry Brearley in England discovered, gave amazing resistance to corrosion, so that it became the base of an important cutlery industry and offered a satisfactory material for rifle-barrels, turbine blades and steel articles subject to both erosion and corrosion; additions to the numberless varieties of alloy steels, largely to secure some desired physical characteristic for specific steels, such as increased tensile strength in terms of lighter members of a fabricated steel product; elements like cerium and zirconium entered the ferro-alloy circle, but a delineation of the various alloys and of their definite fields of usefulness was not completed.

*Production.*—The appended table was compiled to give some measure of the relative producing capacity of the leading industrial nations of the world. The figures are of actual production—before the World War for such countries as France, Belgium and Russia, but during the war for the United States, the United Kingdom (in steel) and Canada. Authoritative information was not obtainable as to the realignment of Europe's capabilities after the war, but the effect of the Versailles Treaty was to bring Germany down close to the level of England in this respect, and to raise France, on the completion of rebuilding plans, to 80% of Great Britain's capacity.

The world's steel-making capacity was put in 1920 at 100,000,000 tons in round numbers. Nearly one-half was credited to the United States, which could make four times as much as Great Britain. The United States' percentage of the world's pig-iron-making facilities was somewhat over 45%. More than one-third of the total annual output of iron ore in the world came from the United States, and of the American production 85% came from the Lake Superior district. The Lorraine ore fields supplied about 25% of the world needs and 80% of it went to France and Germany.

World statistics of the production of ore, pig-iron and crude and finished forms of steel are obtainable from the National Federation of Iron and Steel Manufacturers, London. (W. W. M.)

**IRVING, HENRY BRODRIBB** (1870–1919), English actor, elder son of Sir Henry Irving (*see* 14.855), was born in London Aug. 5 1870. He was educated at Marlborough and New College, Oxford, and was called to the bar in 1894; but he quickly abandoned this profession for that of the stage, for which his inherited aptitude had always been very marked. At Oxford he had belonged to the O.U.D.S. and had played the leading parts in Browning's *Strafford* and Shakespeare's *King John*. His first professional appearance in London was made Sept. 1891 with John Hare at the Garrick theatre in Robertson's *School*. Three years later he joined Mr. Ben Greet's company, where he met Miss Dorothea Baird, whom he married in 1896 at the time of her great popular success in Du Maurier's play of *Trilby*. His earliest notable success was in Barrie's *The Admirable Crichton* in 1903, and he followed it by an interesting impersonation of Hamlet in 1905. His picturesque appearance and strong likeness to his father induced him to repeat many of his father's famous parts; but he did original work of a high order in Stevenson's *Dr. Jekyll and Mr. Hyde*, in Stephen Phillips's *The Sin of David*, in Walter Hackett's *The Barton Mystery*, and in other romantic and melodramatic productions, many of them produced at the Savoy theatre, London, of which he was lessee and manager from 1913 until his death. Throughout his life he was a keen student of criminology, and he published a *Life of Judge Jeffreys* (1898); *French Criminals of the 19th Century* (1901); *A Book of Remarkable Criminals* (1918) and other papers on the subject. He died in London Oct. 17 1919.

His younger brother, LAURENCE SYDNEY BRODRIBB IRVING (1871–1914), English actor, was born in London Dec. 21 1871.

He was educated at Marlborough and abroad, being destined for the diplomatic service; but he joined Frank Benson's Shakespearean company in 1893 and made his first professional appearance in London a year later with J. L. Toole in Barrie's *Walker, London*. He married the actress Mabel Hackney, and with his wife played in Brieux's *The Three Daughters of M. Dupont* and *The Incubus*, as well as in *The Unwritten Law*— his own adaptation of Dostoievsky's *Crime and Punishment*—and in Lengyell's *Typhoon*. In 1912 he acted Iago in Herbert Tree's production of *Othello*. He wrote *Peter the Great*, produced by his father in 1898, *Bonnie Dundee* and *Richard Lovelace*, as well as a number of translations and adaptations of plays. Both he and his wife lost their lives when the "Empress of Ireland" sank in the St. Lawrence river May 29 1914.

**ISOSTASY**, in Geology.—When the Great Trigonometrical Survey of India was initiated, it was found that the deflection of the plumb-line by the Himalayas was much less than the calculated amount due to the theoretical attraction of the visible mass of the mountains. Sir G. B. Airy suggested that this might be caused by the presence of a mass of matter, of less than the average density, under the mountains; this explanation was further investigated by Archdeacon J. H. Pratt, who applied the term *compensation* to the negative effect of the underlying defect of density, in compensating the direct effect of the attraction of the visible mass of the mountains. In 1892 Major C. E. Dutton, discussing the greater problems of physical geology, deduced a general principle that the weight of matter under any unit area of the earth's surface tended to become uniform, and suggested that this was brought about by an underground transfer of material to balance the visible surface transport from regions of erosion to those of deposition. To this principle he gave the name *isostasy* (ἴσος, equal, and στάσις, position), not as a synonym for Pratt's compensation, but as a name for the principle and process by which it was brought about. In 1909 there appeared a very complete and elaborate investigation of the subject, by J. F. Hayford, in which the word isostasy is used throughout as synonymous with what Pratt called compensation, and this use of the term has since become general among geodesists. Some inconvenience results from this change in the meaning attached to the word, for it is still largely understood by geologists in the sense intended by its inventor, as the process by which the fact implied by Pratt's word, compensation, is brought about (*see also* GEOLOGY).

**ISRAËLS, JOSEF** (1824–1911), Dutch painter (*see* 14.885), died at The Hague Aug. 12 1911.

**ISVOLSKY, ALEXANDER PETROVICH** (1856–1919), Russian statesman, was born in 1856 in the government of Vladimir, of a family which for generations had appertained to the lower officialdom. At the age of 20 he received his first diplomatic appointment at Rome, and was thence transferred to Philippopolis and Bucharest, where, by the patronage of Princess Urusov (wife of a future Russian ambassador at Paris), he made his reputation. Thence he was sent to Washington and the Vatican. At this time he was already so much the coming man that, upon the retirement of Count Lobanov, his mother-in-law, Countess Toll, saw fit to inform Count Muraviev that her son-in-law, upon his appointment as foreign minister, would bear him in mind. Muraviev, who already carried his nomination in his pocket, resented this condescension, and relegated Isvolsky to Belgrade and to Munich, where he had the rank of a minister plenipotentiary. Returning to favour in 1899, he was promoted to the Legation at Tokio, where, however, under the influence of German reports concerning the Japanese army—and especially its artillery—he misjudged Japan's advent as a Great Power. His eleventh-hour conversion could not avert the conflict of interests which led to the war of 1904–5, from which Russia emerged defeated, but enabled him to veil a serious diplomatic error by relinquishing the odium of failure to his successor, Rosen. He himself went to Copenhagen, where he negotiated the passage of Admi. Rozhestvensky's fleet through the Great Belt (Oct. 1904). There also, in July 1905, he had his historic interview with the Emperor William II. in which an alliance between Russia, Germany and France was proposed. Isvolsky was ignorant of the "personal" treaty of defensive alliance "between Germany and Russia, entered into by the respective sovereigns at Björkö." Though this secret compact did not bear his signature (since he had not been present), the Russian Minister for Foreign Affairs, Count Lambsdorff, fell over its repudiation, and was, in May 1906, succeeded by Isvolsky.

Russia's military prestige was at a low ebb, her finance in a state of chaos, the Tsarist régime discredited and the country in the throes of revolution. At this time, Isvolsky displayed great physical courage in that he went about St. Petersburg unattended, but also great lack of faith in the existing order, since, having discovered that through an irregularity his pay depended on the Privy Purse, he caused it to be charged to the Treasury as the first act of his tenure of office. He also raised his brother to the office of Procurator of the Holy Synod and his Goadachev relations to high diplomatic appointments.

Slowly he restored the national prestige, for he asserted loyalty to France as the first principle of policy and brought about the Anglo-Russian agreement in Persia of Aug. 31 1907, which was followed on June 9 1908 by a meeting between King Edward VII. and the Tsar Nicholas II. near Reval. The long Balkan troubles of 1908-12, which originated in Count Aehrenthal's exploitation of Russia's transitory weakness, called for great care, especially during the crisis of 1908–9, which laid bare Russian impotence. After four years at the Foreign Office, which gained Russia the time she needed to recuperate, Isvolsky succeeded M. Nelidov as Russian ambassador in Paris. He lived to see the World War of 1914 and the Russian revolution of 1917, which forced him into impoverished retirement at his villa at Biarritz. He died on Aug. 18 1919. An accomplished man of letters, a competent critic of art, a linguist of rare perfection and charming in manner, but cynical and pleasure-loving, he was certainly one of the chief diplomatic personages in the reign of the last of the tsars. He married Marguerite Carlovna, *née* Countess Toll, a Balt of great charm whose influence at court was impeded by her ignorance of the Russian tongue. By her he had one son, who fought in the Dardanelles.

(W. L. B.)

**ITAGAKI, TAISUKE,** COUNT (1837–1920), Japanese statesman (*see* 14.887), died in 1920. True to his radical principles, he forbade his son to apply for the succession to his title, and it lapsed.

**ITALIAN CAMPAIGNS, 1915–8.**—At the outbreak of the World War the Italian general staff had no worked-out plan for an offensive campaign against Austria-Hungary. The omission was not due to the fact of the Triple Alliance, for the prospect of war on the N.E. front had always been faced, but to the relative military position of the two countries. The Habsburg Empire had a great superiority over Italy in organized and potential man-power and in material, but the controlling factor which seemed to deny the possibility of Italian offensive action was the frontier drawn in 1866. The Trentino salient, thrust down like a great wedge to within a few miles of the Lombardo-Venetian plains, dominated the strategical situation. Nor was the hampering influence of the frontier confined to a practical veto upon attack. Its length in relation to Italian military strength, and above all the fact that the threat of the Trentino came so far west in the long line, meant that Italy's defensive frontiers were far from being coterminous with her political boundaries. The first possible line of defence was held to be the Tagliamento, with its fortified bridgeheads at Osoppo, Codroipo and Latisana; plans had been drawn up with the Piave as the main line of resistance, though with the intention of meeting the enemy in the plain E. of the river; but there was much to be said for the contention that the true military frontier of Italy was still the line of the Mincio and the Po.

The plans and studies of peacetime had been based upon the supposition of a duel between Italy and Austria-Hungary, and the outlook changed in view of the general conflagration. The prospect of a break with Austria-Hungary was at once considered by the Italian general staff, and by Aug. 21 1914 a scheme of offensive operations had been outlined. This plan was based upon the supposition of Italy's entry into the war within a month and upon the consent of the Italian Government to provide at once for the requirements put forward by Gen. Cadorna, chief of the general staff. As neither condition was fulfilled, the plan need not be discussed, and it was in fact withdrawn by Cadorna a month later. The preparations of the winter and spring and the march of events on the French and Russian fronts determined the plan of operations which it was hoped to carry out upon Italy's entry into the war.

Gen. Cadorna, who took command of the Italian armies on the declaration of war, had worked out his scheme on the idea that Italy's object should be to hold on the N. and push towards the E. He had not sufficient strength to attack in both sectors. This decision, however, did not imply a passive defensive on the mountain front. On the contrary, the choice of the eastern sector for the main offensive demanded an active defensive, or rather a limited offensive, on the mountain front, and especially in the Trentino. If the operations towards the E. were to be developed with reasonable security it was absolutely essential to improve the position in the Trentino, to reduce, at least, the threat to Italian communications caused by the great salient. The long frontier may be divided into three sectors: (1) the Trentino salient; (2) the great barrier of the Cadore and Carnic Alps; (3) the eastern frontier from Pontebba to the sea. In the first of these sectors the Austrians had an overwhelming advantage in the natural lie of the terrain and the use which had been made of it. The salient was well protected on the flanks; on the W. by the great Alpine mass that is broken only by two feasible passes, the Stelvio and the Tonale, and on the E. by the mountains N. of Asiago and the great rocks of the western Dolomites, a wall that had only two gaps, the narrow valley of the Brenta and the road that runs from Feltre by Fiera di Primiero and the Passo di Rolle. The Austrians were in this position, that they could defend the salient with a comparatively small number of troops thanks to the immense natural strength of the positions they occupied and the system of fortifications which had been prepared, while within their mountain walls and behind these fortifications they could concentrate forces for an attack through the comparatively narrow mountainous zone which lay between the frontier and the plains. Three classic military routes led into Italy, through the Guidicaria, Lagarina and Sugana valleys, and other roads had opened up the difficult country between the Adige and the Brenta. East of the Trentino, from the Marmolada through the Alps of Cadore and Carnia as far as Pontebba, operations on an important scale were almost equally difficult for both sides, in face of the natural advantages that lay with the defensive. The Italians had a greater depth of mountainous zone to back their first lines, but the Austrians, with the Pusterthal and the Gailthal, were very much better off for lateral communications. The third sector of the front, from Pontebba to the sea, was less unfavourable to an Italian attack, but here also the conditions were very difficult. Between Pontebba and the Isonzo great mountains blocked the way, while the upper and middle reaches of the Isonzo flow through a wild, mountainous country with few roads. South of Tolmino indeed the mountain masses decrease in height and steepness, but the country still has the aspect of a giant ridge and furrow. The plain of Friuli narrows rapidly as it approaches its eastern limits, and at the old frontier the gap between the lagoons and the foothills of the Julian Alps is not 15 m. in width. And this gap has little depth; less than 10 m. to the E. of the old frontier begins the plateau of the Carso. The approaches from the W. are completely commanded from the Carso and the hills about Gorizia, and to the E. the ground rises again. Here, too, Italy had to fight over country where the enemy had a very great advantage in position. Still, the natural obstacles were much less formidable towards the Isonzo than elsewhere along the frontier; communications were fair in the plain and there was space for an attack upon a relatively wide front. Above all, a successful advance in this direction would lead somewhere, would threaten a vital part of the monarchy. An invasion of the Trentino held no such promise. At the most, success would have meant the reduction of the salient and the occupation of the "unredeemed" territories, for northern Tirol must be considered impregnable. The choice of Cadore and Carnia for the main offensive was open to the same objection. Given the strong defensive positions near the frontier, the Austrian superiority in communications and the distance of any objective of first-class importance, the prospects of an advance in strength afforded by this region were not tempting, the less so as the district afforded little in the way of supplies. There was a further argument in favour of attacking towards the E., that an attack in this direction would be calculated to occupy a much greater number of enemy troops than an attempt to advance in the mountains. The fact that Austria-Hungary was already heavily engaged elsewhere gave the Italian general staff the chance of attacking but there were corresponding obligations. The Italian campaign had obviously to be planned as part of a whole, and it was the duty of the Italian command not merely to strike for Italian aims but to coöperate in the general struggle.

Cadorna decided on the plan that offered the chance of the greater success, and he framed his scheme of operations on the supposition that in May 1915 he could expect simultaneous offensive action on the part of Russia and Serbia. The objections to an offensive in the direction of Trieste and Laibach were obvious enough: a successful advance meant the lengthening of a front that was already very long in proportion to the number of troops and guns available, and, moreover, increased the menace of the Trentino salient. But the drawback was lessened by the expectation of Allied action on the N.E. and S. fronts of Austria-Hungary, which would prevent the enemy from taking advantage of this weakness.

Cadorna's plan, completed in detail while the Russians were still upon the Dunajec, was as follows. Gen. Roberto Brusati with the I. Army was to conduct a limited offensive against the Trentino salient, with the object of shortening the line and securing strong defensive positions. Gen. Nava with the IV. Army was to push N. from Cadore to threaten the enemy communications in the Pusterthal and coöperate in an advance from Carnia. This advance was to be conducted by a separate force under Gen. Lequio, consisting mainly of mountain troops, which was to move in the direction of Tarvis. The II. and III. Armies, under Generals Frugoni and Zuccari respectively, were to cross the Isonzo and attack E. with all speed. A large number of troops, with units brought up to war strength by the recall of several classes, had been in the neighbourhood of the frontier for many months. They were not in sufficient strength for attack, but were aligned with the object of covering mobilization; for the enemy was already fully mobilized, and the prospect of a sudden attack on his part had to be considered.

As the discussions between Rome and Vienna gradually led towards the final break, the Austro-Hungarian command prepared for defence. In addition to the strong permanent works already existing on the main routes, "barrier lines" were constructed in the valleys and on the open sectors of the front; many of the fortress guns were removed and placed in well-concealed positions, and wire was lavishly employed. At the end of April the Austrian covering troops, under the command of Gen. von Rohr, numbered about 80,000 infantry, 1,400 cavalry and 54 batteries, in addition to fortress troops and guns. Two divisions under Gen. von Koennen-Horac were stationed in the Trentino; one division under Gen. von Langen watched the approaches to Carinthia; two divisions under Generals von Boog and von Kuczera were upon the middle and lower Isonzo respectively, or, rather, E. of the river, in the mountains, on the Carso and about Gorizia. These divisions were improvised formations, with a considerable proportion of second-line troops and volunteer battalions.

When Italy denounced the alliance with Austria-Hungary, on May 3 1915, Vienna was already convinced that war was certain. The attempts to continue discussions had only been undertaken for the purpose of gaining time, and military preparations were hastened. It was the first intention of Gen. Conrad von Hötzendorf to wait for the Italians at Klagenfurt and Laibach and attack them as their columns came out of the mountainous country, but the plan was not approved by the German command. Falkenhayn declined to give the 10 divisions which Conrad required for this plan, and it was abandoned. Conrad wished to smash Cadorna's offensive by manœuvre and counter-attack. Falkenhayn was not only unwilling to spare the troops for this plan but he doubted whether Cadorna would allow himself to be led into Conrad's trap; he feared the difficulties of recovering territory once abandoned, and he realized the great natural strength of the Isonzo and Carso lines. It was decided to conduct an obstinate defensive rather than to attempt Conrad's plan. The command of the Austro-Hungarian armies on the Italian front was given to the Archduke Eugene, who had commanded the Balkan armies. His chief of staff was Gen. Krauss, and under his direction Gen. Dankl, lately in command of the I. Army, was entrusted with the Tirol and Trentino sector; Gen. von Rohr commanded on the Carinthia front, while Gen. Boroevich von Bojna, lately in command of the III. Army, took charge of the Isonzo–Carso front. It was not until May 21, three days before the declaration of war, that the main body of Boroevich's army, consisting of five divisions brought from the Serbian front, began to be entrained from near Agram. When war was declared the Isonzo front, from Tolmino southward, was lightly held by three divisions under Gen. Ludvig von Goiginger.

Meanwhile Cadorna had to adapt his plans to the quickly changing circumstances. The Russian armies N. of the Carpathians had given way under the attacks of Mackensen and Boehm-Ermolli, and had begun the great retreat that was to go so far. There was no word of movement, even of demonstration, on the Serbian front. The request of the Allies that the Serbian armies should resume action, or at least make a show of action, met with no response, and in May the Austro-Hungarian troops on the Serbian front were reduced by five divisions, their place being taken by three newly formed German divisions, which had not yet completed their establishment. Various reasons, military and political, have been given for the inaction of the Serbians, but in the present connexion it is simply the fact that matters, the fact which allowed five Austro-Hungarian divisions to be transferred *en bloc* from the Serbian front to the Italian theatre of war.

The altered circumstances compelled Cadorna to revise his immediate objectives, but not his general plan of attack. A further handicap, in his view, was imposed by the denunciation of the alliance with Austria-Hungary three weeks before the declaration of war, and by the immediate leakage regarding the London agreement between Italy and the Entente, which gave the enemy more grace to prepare against his initial moves. The time for preparation was further lengthened by the political crisis caused by the last efforts of Berlin and Vienna to keep Italy out of the war. On the other hand, the main body of the Italian army was not ready for an earlier advance. It was not fully ready when war was declared. Mobilization was nearly complete as far as the men were concerned, for drafts had been brought up gradually during the previous months. The armies were ready to fight in their positions against an Austrian attack, or for preparatory movements on a limited scale. They were not ready, the eastern armies in particular, for a big advance.

On the eve of war, Cadorna's dispositions were as follows: Brusati's I. Army, with 5 divisions and 10 battalions of Alpine troops, was to push forward in the Trentino, and carry out the limited offensive already indicated. The IV. Army under Nava was to advance, the right wing upon the Pusterthal, the left wing across the great Dolomite road, past the peaks of the Sella group, to threaten the valleys running down to the Eisack. Nava had five divisions and seven Alpine battalions, while a sixth division of his army was at first held in reserve about Spilimbergo, near where the Tagliamento runs out into the plain of Friuli. To this army, in view of the positions which it had to attack, especially the Landro and Sexten fortifications, was assigned the bulk of Cadorna's very limited supply of heavy artillery, including practically all the guns above 149 mm., with the exception of seven batteries of 210's, assigned to the Carnia force. The task of Lequio's Carnia force, which consisted of an infantry division and 16 battalions of Alpine troops, was that designed in the original plan, the probable movements, in the event of success, depending upon those of the armies to right and left. The II. and III. Armies were to attack with all speed upon the Isonzo front, but their movements were to be inspired by strategic caution. They were to get under way as quickly as possible and break through the enemy's covering troops. Further movement was to depend upon what they found, and upon the news from the other fronts. While initial speed was obviously the essence of Cadorna's plan, he was handicapped by the fact that another fortnight was required for complete mobilisation. Frugoni's II. Army was to consist of three army corps (eight divisions), and Zuccari's III. Army of three corps (six divisions) with three cavalry divisions. On May 24 only three corps and two cavalry divisions were ready for the initial attack. Meantime there had been a difference of opinion between Cadorna and Zuccari, and the clash of two strong characters made the difference irreparable. As a result Zuccari was relieved of his command and the III. Army was entrusted to the Duke of Aosta, on the very eve of the declaration of war.

In addition to the divisions already mentioned, a central reserve of 10 divisions and one cavalry division was in process of mobilization in the plains of the Veneto and Friuli,—5 infantry divisions in the rear of the Trentino sector, the other 5 and the cavalry between the Tagliamento and the eastern frontier,—but these troops could not be ready for action for some three weeks. The first shots of the war were fired by Austrian guns upon the Carnia front, a few hours before midnight on May 23, the hour fixed for the opening of hostilities, and early on May 24 the Italian advance began.

The opening moves of the campaign, all-important as they were in relation to the future operations which depended upon them, failed to obtain the results hoped for in Cadorna's design. The I. Army was prompt to carry the limited objectives assigned to it, overcoming the weak resistance of the enemy covering troops and occupying positions which not only were in themselves much better adapted for defense than the frontier, but greatly reduced the length of the line to be held. The IV. Army was very slow. Its heavy guns were not ready when hostilities began, and Nava waited upon their arrival, preoccupied by the strong positions which faced him and the permanent fortifications which lay beyond. It would appear that he was influenced by the positions themselves and assumed the existence of an opposition which in fact he would not have found. He was not ready himself to carry out his plan of advance, which was based on the supposition that the enemy resistance was already adequately organized. He held by his plan and may have missed an opportunity of reaching his objective by changing it. His initiative was hampered by adherence to method. Lequio's Carnia force was quick to move, and found that the enemy was equally quick. This sector was all-important to the Austrians, from the point of view both of offence and defence. It was essential to prevent a break-through to Tarvis and Villach, and if they could hold the frontier line it preserved for them the chance of the attack down the valleys converging upon the Tagliamento which had long figured in the plans of their general staff. This sector had been quickly reinforced as the danger of war became imminent; and here alone, in the first days of the campaign, there was, roughly speaking, an equivalence of infantry strength. The contending troops met on the passes and the mountains that flanked them; and though the Italians had the best of the fighting which followed, and wrested several important positions from the enemy, it was quickly evident that the way was blocked here against all but an attack in overwhelming

strength. On the other hand, Lequio's quickness had locked a door upon which the enemy had his eye.

Meanwhile the II. and III. Armies were on the move. Frugoni with two corps (5 divisions and 14 battalions of *Alpini*) attacked along the line of the Isonzo from Saga to opposite Gorizia. The Duke of Aosta, with a single corps and two cavalry divisions, was to force the passage of the lower Isonzo and push on towards the Carso, his other divisions following rapidly as their preparations for movement were completed. The II. and III. Armies were in theory organized for quick movement; their artillery, except for 12 batteries of 149-mm. guns, consisted entirely of field-guns, mountain-guns and 149-mm. field-howitzers (19 batteries), and the proportion of guns to men and shells was very low. Speed and initiative were essential to the success of the opening moves, and at various points speed and initiative were lacking.

The Austrians had withdrawn beyond the line of the Isonzo, except at the two bridgeheads opposite Tolmino and Gorizia, which were held in force, and S. of Gorizia the line of defence chosen was the Carso plateau, only a few covering troops being disposed along the lower reaches of the river, which leaves the Carso at Sagrado. For the II. Army the first obstacle was the river line and the two bridgeheads, and the main initial attack was to come from the II. Army, whose preparations were further advanced and which was échelonedforward; but the I. Cavalry Division, which was attached to the III. Army, was to dash for the Pieris bridges and secure the crossing for the infantry. The cavalry were inexplicably slow, and the bridges were destroyed just before they arrived. This failure would have mattered less, and might have mattered not at all, but for a sudden and violent flood which filled the wide bed of the Isonzo with a deep and rapid stream and made the fords impassable. And the pontoon trains were far away. Cadorna had counted on passing the lower reaches of the river by bridge and ford, and his very inadequate supply of bridging material had been designed for later use or use in other sectors of the front. It was not until June 4, when the river was falling, that it was possible for the right wing of the III. Army to throw troops across in force. Meanwhile the left wing had advanced from Cormons against the northern half of the Carso, where the Isonzo flows like a moat under the plateau, and farther N. the II. Army had come in touch with the enemy all along its front. The long ridge which separates the valleys of the Judrio and the Isonzo from Kolovrat to Verhoolje, was occupied without resistance, but the Austrians had fortified the bridgeheads opposite Tolmino and Gorizia, and here an unexpected opposition was found. Both bridgeheads were naturally very strong. In neither case, owing to the course of the river, did the Austrian position form a salient. The defence of the hills of Santa Lucia and Santa Maria opposite, Tolmino, and of Monte Sabotino and Podgora, N. and W. of Gorizia, was supported by direct flanking fire from the positions to the N. and S. on the left bank of the river. The right wing and centre of the II. Army were quickly brought to a standstill in front of the bridgeheads; tentative attacks, carried out by small detachments, were readily repulsed, and a pause followed. The bridgeheads were invested, and here too, perhaps, the theory of "fixed positions," the old rule that these could not be ignored, had too much weight with the attacking forces. For every day lessened the chance of breaking through the thin enemy line, strong only at selected points. On the other hand, the country is extraordinarily difficult, and roads were few and mostly bad. And those which were suitable for the movement of troops and guns led only to the points where the enemy was holding in some force. On the left wing of the army the IV. Corps under Gen. Di Robilant crossed the Isonzo N. of Tolmino and pushed up into the mountains E. of the river, hoping to turn the Tolmino position. Appalling weather made movement in the mountains impossible during the critical week, and when the chance of a surprise had gone the great barrier of the Julian Alps was an insuperable obstacle to such forces as the Italians could bring against it. Guns, shells, machine-guns and transport were lacking.

The Austrians were rushing troops to the Italian front, and by the middle of June Boroevich had eight divisions to put against the II. and III. Italian Armies. Rohr's Carinthian army had been reënforced by two divisions and a mountain brigade from the Russian front. Dankl's Trentino army, which was not organized in divisions, but in groups assigned to various defensive sectors, had been increased to 96 battalions, including the Bavarian *Alpenkorps* which had come into line by the end of May. The Austrians were greatly inferior in numbers—they had on the front some 20 divisions against Cadorna's 35—but they held positions which were naturally ideal for defence, and these were well fortified by art, too well for the limited means of destruction at the disposal of the Italians.

Cadorna had counted upon surprising the enemy, but this advantage had been partly denied him. When he heard of the denunciation of the treaty with Austria-Hungary he pressed for an immediate declaration of war, which would allow him to move at once and reach the positions he had designed as his first objective. A striking force was ready then—there were nearly as many troops available for immediate movement in the first week of May as there were at the outbreak of war—and he would have gained between 15 and 20 precious days. Political considerations stayed his hand, and the initial delay was lengthened by the Bülow-Giolitti crisis. Bad weather and hesitation on the part of junior generals did the rest. The operations N. of Tolmino were practically stopped by the fierce mountain storms, and the advance of the III. Army only reached Monfalcone on June 6. Nor even then was it possible to attack the plateau in force. By blowing out a bank of the Sagrado–Monfalcone canal and closing the dam across the river, the Austrians had used the flood waters of the Isonzo to inundate a great stretch of low-lying ground below the Carso. It was not until June 11 that the dam near Sagrado was destroyed and the flooded area ceased to be fed by the waters of the river. During the following days the Italians succeeded in throwing troops across the Isonzo near Sagrado and by June 27, after prolonged and heavy fighting, they had pushed the Austrians up the slopes S. of Monte San Michele and established the bridgehead that was necessary for a general attack on the whole front of the Carso. Meanwhile a small bridgehead had been established at Plava, a few miles N. of Gorizia. The quick-flowing waters of the Isonzo, which here run pent in a narrow gorge, were crossed on June 9, 10 and 11, with great difficulty. The bridgehead won was very limited in area, and dominated by the mountains on the eastern bank; it was long before it could be enlarged to any great extent. Attacks were made along the greater part of the front from Tolmino to the sea at the end of June and during the early days of July, but these hardly reached the standard of a methodical, organized offensive on the scale that was now clearly necessary. There was some very stiff fighting during these days, and both sides lost heavily, especially on the slopes of the Carso, where the Austrians gave ground here and there and on more than one occasion were very hard pressed to maintain their lines intact. Two fresh divisions were brought from Carinthia to strengthen the threatened line between Gorizia and the sea, while another division was brought from the Balkan front and a mountain brigade from Pola. The Italian attacks had hitherto been conducted at "long range": that is to say, the point of departure for the infantry advance was at a considerable distance from the enemy entrenchments. In many cases the attacking infantry was checked before it reached the wire entanglements; too often when the wire was reached it was found nearly intact, for the destructive power of the Italian guns was insufficient to clear the way for the infantry, and many gallant attempts with wire-cutters and gelatine tubes were inevitably condemned to failure. Gradually it became evident that the hopes of a war of movement must be given up, that only the slow processes of trench warfare could lead to success. Sporadic attacks continued during the first half of July, and though the Austrians held on to most of their positions the Italians established themselves at much better jumping-off places than those which they had occupied before.

On July 18 the Italian III. Army attacked in the most determined manner, and after three weeks' hard fighting, during

which the Austrians made a great attempt to push the Italians back across the river near Sagrado, the struggle came to an end with the latter firmly established under the crest of Monte San Michele and the village of San Martino del Carso, and in possession of most of Monte Sei Busi. Similar attacks by the II. Army made little impression on the Austrian lines, and losses were heavy, but the Austrians also suffered severely, losing more than 10,000 prisoners. The lesson of two months' fighting, apart from the necessity of learning the business of trench warfare, was that the artillery, and especially the heavy artillery, at the disposal of the II. and III. Armies was altogether inadequate. There were not enough heavy guns and not enough shells, and much of the ammunition was defective. The bursting charge was weak, and there were a large number of "prematures." It was essential to increase the weight of artillery fire if the infantry were to have a chance. It was clear that developments in artillery technique were necessary, and the importance of counter-battery work began to impress itself upon some of the commands. But shells were few, and observation from the air was not taken seriously, so that it was long before the advocates of counter-battery work made any headway.

After two months' preparation a fresh attempt was made to break through on the Julian front. This action was preceded by various attacks in other sectors of the front, some of which resulted in useful territorial gains, while others carried the line forward without improving the general position or even with the result of weakening it. By his main attack Cadorna hoped to turn the Gorizia positions both from the N. and the S., and as a secondary operation, after crossing the middle Isonzo, to threaten Tolmino from the S. while the bridgehead and the town were attacked from the W. and N. It was also hoped to gain ground on the southern Carso, in the direction of Trieste. Cadorna had a great numerical superiority in men. The II. Army now consisted of 12 divisions and the III. of 7, while a reserve of 5 divisions lay ready in the Friuli plain. In all, Cadorna could dispose of 312 battalions on the Julian front. When the attack began Boroevich had about half this number of troops, but within three weeks he had the equivalent of 15 divisions at his disposal. It was on the II. Army front that the Italian superiority in number was great; on the Carso indeed the Duke of Aosta had no great advantage in numbers over the Archduke Joseph, who had assumed the command in this sector in July. But the terrain on Boroevich's right was such that he could expect to hold with greatly inferior forces, especially in view of the Italian weakness in artillery. Cadorna had put upon the Julian front every piece he could collect. He reduced the guns in the other sectors to the barest minimum; he dismantled the forts at Mestre and the lines of the Tagliamento, and so was able to form 20 batteries of medium-calibre guns, of old pattern. Altogether he had been able to give to the II. and III. Armies some 300 medium and heavy guns, but many of these were obsolete. And the supply of shells was very meagre, 25–30 per gun per day. The III. Army had the bulk of the heavy artillery, only 125 pieces being given to the II. Army, which had to attempt, by sheer superiority in infantry strength, to make up for its deficiencies in material. Along the whole Julian front there were some 1,250 guns of all calibre, and a million shells had been collected by the date fixed for the attack—Oct. 21.

The offensive went badly, like all the Allied offensives of those days. The means were insufficient for the width of front attacked; the artillery technique was not adapted to modern requirements, nor, as was natural at this stage, had the staffs as a whole,—army, corps or divisional,—fully realized the necessity of minute preparation and strict attention to detail. And a tendency noticeable during the first months of the war, especially in the II. Army, to use men in isolated *petits paquets*, first one detachment and if that failed then another and another, was still observable. The attempt to cross the river between Plava and Tolmino never promised success, for the preparations were insufficient and the crossing-points not well chosen. Although some successes were obtained N. and W. of Tolmino the attack in this region was not persisted in, owing to the failure farther south. The attempt to extend the Plava bridgehead and so gain room to threaten Gorizia from the N. was equally unsuccessful. After various attempts both these actions were broken off, and the battle was concentrated upon the Gorizia bridgehead and the Carso. Sabotino had been taken by direct assault on the first day of the battle, but, owing to defective staff work and an attitude on the part of the army command that can best be described by the phrase "*laisser aller*," this success was not promptly backed up, and a fierce counter-attack drove the Italians off the ridge they had so gallantly stormed. All subsequent attempts to retake Sabotino failed, and the prolonged struggle for the hills about Oslavia and the battered hog-back of Podgora was little more successful. The Italians gained ground here and there, eating into the Austrian lines, but they could not break through. Farther S. the attacks of the III. Army met with similar fortune. Ground was gained, a trench here, a trench there, and the Italian line was carried almost to the summits of Monte San Michele. The attacks were renewed again and again, and the troops displayed remarkable gallantry and resolution. They were met by a resistance no less determined, and the losses on both sides were very heavy indeed. Early in Dec. the offensive died down. Cadorna's battalions were worn out by their prolonged and gallant efforts, and drafts were not forthcoming to fill their terribly depleted ranks. During the six weeks' fighting Cadorna lost nearly 140,000 men, and he had little to show in the way of tangible prize. Nor did the mere figures of the casualty list give the measure of the loss suffered. The gravest loss was that of the trained officers and under-officers, who could not be replaced. Cadorna could not claim a victory, but he had reduced the forces of Boroevich to the last extremity. He had come very near performing what he had not means to perform, and only stubborn valour and an ample supply of machine-guns saved the Austrian lines. Boroevich had his back to the wall when the Italian offensive came to an end. He had lost nearly 9,000 prisoners; his battalions were worn out and his reserves were exhausted; but Cadorna had no strength left for a further attack.

The results of the first seven months' campaigning were disappointing to those—and they were many, both in Italy and in the Allied countries—who had hoped for far greater effects from Italy's intervention. Some of the reasons for Cadorna's comparative lack of success have been indicated in the course of the narrative and some are illustrated more fully in other articles. First of all stands the fact that in May 1915 the Italian army was very meagrely provided with the material necessary to modern war. Cadorna's only chance of early success on the lines expected by the optimists lay in quick movement against an enemy unable to man the passes and defensive lines that lent themselves so well to resistance, even in face of greatly superior forces. The southern half of the Julian front offered a far better chance of an Italian success than any other sector. There was no comparison as regards terrain or communications. Yet it was the Austrian positions in this region that Falkenhayn described as "ideal for defence against superior numbers." When, for the various reasons which have been given, Cadorna's first move failed to secure the results hoped for, the Italian armies were forced into a warfare for which they were very badly prepared. It is true that they were badly prepared for any kind of warfare, and would hardly have fared better in a campaign of movement. In any case, a new technique had to be learned and the means for developing it were not available. The story of the first seven months of the Italian campaign is the story of a magnificent attempt to supplement deficiencies in skill and material by resolution and heroism. Not that resolution was always evident. Instances of the contrary have been given, and there were others: the long tale of general officers dismissed by Cadorna during the first months of the war bears witness to failures.

During these early months the Austrians, both officers and men, were clearly superior in skill to their opponents. They had the advantage of nine months' experience when Italy took the field, and they made good use of it. And their superior skill was

backed by a spirit which the armies of the Dual Monarchy sometimes failed to show on the eastern front. The Slav troops which fought with reluctance against Russia displayed a very different demeanour against Italy, and, according to Gen. von Cramon, head of the German Mission at Austro-Hungarian headquarters, this was specially noticeable in the case of the Southern Slavs, whose country was immediately threatened with invasion, and who had ambitions of their own which conflicted with those of Italy. The rest of the Habsburg peoples, moreover, were embittered by Italy's transformation from an ally to an enemy, and both Falkenhayn and Hindenburg bear witness to the fact that the Austrian army showed a very different spirit against its two main adversaries.

Many lessons were learned by the Italian army during the campaign of 1915, and the experience of these months bore fruit also in other quarters. It began to be realized in Rome that the army must have what it needed, that "conservative finance" had to give way before the imperious requirements of modern war, that every idea or estimate regarding numbers of men and supplies of munitions had to be revised in the light of new experience. The winter months were busily employed, especially in the munition factories. A great effort was necessary, for at the end of the 1915 campaign Cadorna had lost half of his small supply of middle-calibre guns through "prematures" or other accidents, and the factories, instead of augmenting his artillery strength, had so far scarcely kept pace with wastage. But the preparatory work was beginning to tell, and as far as artillery was concerned the situation was largely transformed during the winter of 1915–6. The small total of heavy and medium guns was increased sevenfold. But shells were still scarce in proportion to modern requirements, especially as these went on increasing with each month. And if Cadorna's artillery strength was greatly increased, so was that of his adversary.

The supply of men, no less than that of material, required to be replenished and augmented. In seven months the Italian losses in the field were close upon 280,000—66,090 killed, 190,400 wounded, and 22,520 prisoners. This was in addition to casualties from sickness, which were heavy, including as they did the losses from an outbreak of cholera which originated with prisoners freshly arrived from the eastern theatre of war. This outbreak was promptly tackled, and did not spread widely, but there were several thousand deaths in the isolated area. Men had to be found, not only to fill up the gaps but to make new formations, for it was clear that the war was going to make untold demands upon man-power. During the winter the gaps were filled and eight new divisions were ready in the spring, while others were in process of formation; and Cadorna had succeeded, after some difficulty, in having the classes required for drafts called up well ahead of his immediate needs. This was especially necessary, as, owing to the small annual contingent taken before the war, the bulk of each class was practically untrained. It was, moreover, necessary to instruct the trained units in the new methods which the trench warfare was evolving, if these new methods were to be carried out successfully. Unfortunately, the necessity for this methodical training was not generally, or even widely, understood, and the Italian army and nation paid heavily for the absence of properly organized training schools and camps. On the other hand, it must be admitted that, to begin with, at least, except for the drafts there was little opportunity for instruction. The men were fully occupied either in fighting or working at the trenches and shelters which had to be made out of live rock, working at roads or hutments or other necessary constructions. There was not even time for necessary rest in these first months. The front was very long in proportion to the number of men available, and if there were relatively few men required to hold the mountain positions, the number required to supply these few with food and drink and fuel and ammunition, especially in winter, was far greater than in the plains.

During the early months of 1916 there was a good deal of sharp fighting on the Julian front, especially at the Gorizia bridgehead. The long struggle of the autumn and early winter had left the Italians in possession of an irregular and unsystematized line, unsuitable for prolonged occupation, and both sides carried out numerous small operations with the object of "rectifying the front." The Austrians were the more skilful at this game, as they were in conducting raids with the object of securing information, but the work done by the Italians with sap and mine on Monte Sabotino advanced the line by more than 600 yd., and brought it close under the main Austrian trenches, eliminating the wide stretch of open ground, exposed to both frontal and flanking fire, which had led to the failure of repeated attacks. In March, when the German attacks upon Verdun were at their fiercest, and rumour said that Austrian reënforcements might be sent to increase the weight of the offensive, Cadorna opened a big demonstrative action against the Gorizia bridgehead. This was only a demonstration, but brisk fighting took place, and both sides suffered considerable loss. Meanwhile preparations for a real offensive on the Julian front were well advanced, when news came that the Austrians were preparing a big attack in the Trentino. Cadorna was slow to believe in this project, which was first reported to him by Brusati on March 22. He considered that the news was a deliberate attempt on the part of the enemy to distract his attention from the Julian front, but further information convinced him that the Trentino offensive was really intended, and meanwhile he had taken what seemed adequate measures against the threat.

It was not unnatural that Cadorna should doubt the report of a really formidable enemy offensive in the Trentino. The situation on the Russian front hardly seemed to justify an Austrian offensive on the grand scale in a sector so "eccentric" (in the literal sense of the word). Conrad, however, had calculated that he could carry out the attack in the Trentino before Brusilov's armies could move. Relying upon his advantage of interior lines and the late passing of winter on the Russian front, he made his preparations gradually and secretly throughout the winter and spring, collecting vast quantities of stores and ammunition about Trento, and sending his reënforcements piecemeal until March, when troops were hurried to the front with all speed. Conrad had proposed the plan to Falkenhayn in the previous Dec., but Falkenhayn disapproved, and in the end Conrad acted independently, stripping his eastern front, especially of guns, to a dangerous extent. According to Falkenhayn, no official intimation of the offensive was given to Germany, and Falkenhayn himself did not know the extent to which Conrad had weakened his forces in the east. On the other hand, Falkenhayn attacked at Verdun without informing Conrad, so that each would seem to have the like ground for complaint.

The *Strafexpedition*, as it was termed in Austria, before the event, consisted of 14 divisions of picked troops, with over 2,000 guns, including a large proportion of heavy artillery. It is clear that such a force was by itself insufficient to "knock out" Cadorna's armies, but it is equally clear that a successful drive through the Italian lines in this sector might have compelled a rectification of the whole Italian front, and might have prepared the way for a further offensive in greater strength. And in the worst event there seemed the prospect that Cadorna's programme for the summer would be seriously upset. But the Austrian staff underestimated the resistance of the Italian infantry and Cadorna's power of manœuvre; and it was mistaken about the date on which Brussilov could attack.

To meet the Austrian attack Brusati had a sufficient number of troops, but a considerable proportion of these were untried, and he was greatly inferior in artillery. He had 850 guns of all calibres, of which 336 were heavy or medium. Apparently both Cadorna and Brusati considered that the I. Army was sufficiently strong to resist the coming attack, and, though both had underestimated the weight of fire that was actually brought to bear on the Italian lines, their estimate of the situation would probably have been justified if the troops available had been more skilfully disposed, if the defensive positions had been better chosen and adequately prepared. Cadorna has been much criticized for his hesitation to believe

in the forthcoming attack, and for his tardy concession of reserves for the threatened sector. The reënforcements sent before the battle may have been insufficient in view of the dispositions made by Brusati, but these dispositions did not fit in with Cadorna's general plan, and, in fact, transgressed his definite instructions. The positions held by the I. Army were at many important points well in advance of those laid down by Cadorna as the definite line of defence upon which he relied for relative freedom in his operations on the Julian front. And much labour had been expended in fortifying these advanced lines, while the "battle positions," marked out as such by nature and by the orders of the supreme command, had been inexplicably neglected. There had already been friction between headquarters and the I. Army command in regard to the tendency of the latter to go outside the rôle allotted. The difficulty was to some extent an outcome of the difference of opinion in regard to Cadorna's strategy which prevailed in the Italian army. It was natural that those who had to deal with the Trentino and Cadore sectors should see opportunity for offensive action and chafe because they were not given the means to act. It was perhaps natural, too, that they should be inclined to do what they could with limited means in the hope of inducing, by the bait of actual success, a revision of the general plan. But such experiments in despite of discipline can only be justified by success. This attitude, and these actions, were inspired partly by the wish to exploit the opportunities that seemed to offer and partly by the difficulty of maintaining permanently an inactive defensive; but they were probably influenced by the belief, which was widely shared, that an offensive in the Trentino would give better results than continuance of the attempts upon the Julian front. In any case, Brusati's I. Army was aligned as though for an offensive. Its main infantry positions and the bulk of its guns were alike badly placed for defence against a resolute attack. By Cadorna's direct intervention the lines were modified in the Val Lagarina and Val Sugana, and on May 8 Brusati was relieved of his command, a measure which Cadorna had wished to take at a much earlier stage. He was succeeded by Gen. Pecori-Giraldi, commander of the VII. Corps (III. Army).

A week later the Austrian offensive was launched. The Italian wings in Val Lagarina and Val Sugana held firm, though some of the positions which should have been prepared had not been touched; but in the centre, between the Val d'Assa and the Val Terragnolo, where the Austrian fire was heaviest and the positions occupied were not suitable for defence, and where the Italian line was thin, the front was driven in. Cadorna, who had himself assumed direct control of the operations, ordered a withdrawal to S. of the Posina and E. of the Astico and Assa, while he dispatched ample reënforcements to support the retiring troops and gave orders for the concentration of a large reserve force, to be known as the V. Army, E. and S. of Vicenza. Heavy fighting went on until June 17, but a fortnight before that date the Austrians were held. By June 2 Cadorna felt himself safe, though his opinion was not generally shared. The line was holding; his V. Army was practically ready in the plains, and still untouched; and in fact, although the Austrians were to gain a little more ground at heavy cost, his confidence was fully justified. The *Strafexpedition* was already condemned to failure when Brussilov, answering the appeal for coöperation made by Cadorna on May 19, attacked the weakened Austrian lines in front of him on June 4, and won the great victory that came within an ace of being decisive, if Cramon may be believed. At the Allied Conference held in the preceding March Brussilov's offensive had been fixed for the first half of May. As the time drew near the delay of a month was proposed, but when Cadorna asked for Russian coöperation and pointed out that the Austrian front in the E. had been weakened in order to carry out the *Strafexpedition*, the answer came that Brussilov would attack on June 2. His offensive, according to Falkenhayn, was not expected by the enemy to take place until the beginning of July; and, though it was delayed by two days in order to bring more troops into line, the surprise was complete. The attack in the Trentino, based on a miscalculation, nearly ended in the collapse of Austria's eastern front and it brought no gain corresponding to the risk run and the losses suffered.

The Austrians were loth to give up the attack that had begun so well. For a fortnight after the beginning of Brussilov's drive they struggled to break through from the mountains to the plain, but at the end of that time, having made but negligible progress, they found their left wing attacked. Cadorna had begun his counter-offensive, and after a week's pressure the Austrians withdrew, flattening the salient which their advance had made. They withdrew skilfully and steadily, before the Italian counter-attack was fully under way, to a line considerably in advance of their old positions, including as it did Cima Dodici, both sides of the Val d'Assa and the Tonezza plateau. This advance was the sole gain made, and the immediate price paid for it, apart from the disaster on the Russian front, was a casualty list that was estimated at over 100,000 men. Nor did the penalty end here. Cadorna refrained from knocking his head against the lines upon which his retreating enemy turned and stood. The positions which he had regained were adequate to his aims in the Trentino, which were purely defensive, and instead of persisting in his counter-offensive he rapidly swung his reserves back to the Julian front, smashed through the Gorizia bridgehead and took Gorizia, and drove the Austrians from the western regment of the Carso plateau.

Cadorna had judged rightly and Conrad wrongly, and the former's swiftness of decision and manœuvre led to a big Italian success. But there was a moment when the situation compelled Cadorna to consider and prepare for the possible retreat of the II., III. and IV. Armies from the Julian and Cadore fronts. Ten days after the opening of the Austrian attack he had to reckon with a possible failure of the troops of the I. Army to prevent the enemy reaching the plains in force. Cadorna made his plans for such a retreat, from the Isonzo to the Piave, and his frank statement of the possibility, together with his request for the recall of a division from Albania and one from Libya (one division had already been recalled from Albania towards the end of April), caused natural alarm in Rome. Salandra suggested a meeting of the commander-in-chief, the four army commanders, the premier, the Minister of War and two other members of the Cabinet, a suggestion which Cadorna declined, insisting that the responsibility for military decisions lay with himself, and not, as Salandra's proposal claimed, with the premier and council of ministers. He requested that if he no longer enjoyed the confidence of the Government he should be replaced at once. Salandra replied that his proposal had been misunderstood; but when the measures taken preparatory to a possible retreat from the Isonzo line were communicated to the Cabinet he returned to the charge, maintaining that such provisions could not be regarded as being confined to the province of the military authorities, but must be subordinate to the decisions of the Government. In reply Cadorna pointed out that military exigencies might demand immediate decisions which could not wait upon the deliberations of a Government, and that responsibility must lie with the commander-in-chief. Fortunately the question was not put to the test. The Austrian offensive was now fairly held, and it was not necessary to consider further, at this time, the question of a general retreat. The incident, however, has an importance as exemplifying a difference of opinion regarding the relative functions of the Government and the supreme command, which was to grow more serious as time went on. It was difficult, if not impossible, to say where precisely the functions of each should begin and end, and at a later date the friction increased.

During July, while a gradual transference of troops from W. to E. was being carried out, and preparations for an offensive on the Julian front were being hastened, the counter-offensive on the Trentino front was continued and several positions were taken, while the Austrians were kept on the *qui vive* by movements in Tirol. The attacks against the new Austrian lines in the Asiago and Arsiero uplands were not very fruitful, and on

July 9, with his eye on Gorizia, Cadorna gave orders to slow down the offensive and return to the idea of defence. The attack farther N., on the other hand, gave good results. It was clearly unexpected by the Austrians, and the Italians made a considerable advance in the region of the Fassa Alps, occupying the Passo di Rolle and the mountains of Cavallazza and Colbricon on July 22, and seizing the village of Paneveggio, in the Val Travignolo, at the end of the month. The Austrians made repeated attempts to recapture their lost positions, hurrying reënforcements into the Val Travignolo, but their efforts were useless, and as the summer went on the Italians gained more ground in successive sharp actions, though operations on the grand scale were never undertaken and were indeed practically excluded by the nature of the terrain and the lack of communications. But the continued threat kept the Austrians nervous, and by the autumn some three divisions of picked mountain troops were concentrated in the valley of the Avisio.

During the winter of 1915–6, in preparation for an attack on Gorizia and the Carso, the right wing of the II. Army had been transferred to the III., so that the whole front from N. of Monte Sabotino down to the sea was under the command of the Duke of Aosta. Both III. and II. Armies had been temporarily weakened by the withdrawal of troops to form the V. Army, but even at the most critical moment of the Asiago battle the Duke had eight divisions and a dismounted cavalry division at his disposal. During July he was reënforced by three divisions, and a considerable number of heavy guns, and at the end of the month four more divisions with their artillery were rapidly transported from the Vicentine plain to the III. Army front. A further division was given to the army from the general reserve, so that the Duke of Aosta had under his direct command 16 divisions and a dismounted cavalry division. He had 1,250 guns, of which 520 were heavy or medium, and these were supplemented by nearly 800 trench-mortars (*bombarde*), of which 138 were of 240-mm. calibre. These *bombarde* had been constructed during the winter in order to make up for the deficiency in heavy artillery which the manufacturing resources of Italy were inadequate to meet. The *bombarda* was in fact much more than what is usually understood by the term trench-mortar. Its range was much longer, and the destructive power of its big projectile was very great. Its advantage over the big gun, given Italy's poverty in manufacturing resources, was obvious. Its disadvantages are equally obvious: its forward position and the big flame of its discharge made it a relatively easy mark for the enemy's guns. The question of ammunition supply was also complicated by the forward position. The *bombarda* was a *pis aller*, but thanks to the devotion of the *bombardieri* it rendered great service.

On the Carso and about Gorizia Boroevich was badly prepared to meet the Italian attack, for Cadorna's quick transference of troops to the III. Army front enabled the Duke of Aosta to throw an overwhelming force against the Austrian lines. Boroevich had only five divisions in line and one in immediate reserve between Sabotino and the sea when the Duke launched his attack, and the Austrians were taken by surprise. The Duke began with a feint. On Aug. 4, after a heavy bombardment, the Italian VII. Corps attacked the low hills E. of Monfalcone, which had already seen much stubborn fighting. They stormed the enemy lines, but were driven back again by a counter-attack. The thunder of the guns continued all along the III. Army front—a far heavier fire than had ever come from the Italian side,—and on the morning of Aug. 6 the intensity of the bombardment was redoubled. The infantry attack came in the afternoon, when the VI. Corps attacked the Gorizia bridgehead and the XI. the summits of Monte San Michele. The VI. Corps, commanded by Gen. Luigi Capello, had outgrown the dimensions of an army corps, for Capello, acting under the Duke of Aosta, was in command of no fewer than six divisions. His attack was brilliantly successful. Sabotino was taken on the run, in 40 minutes, while farther S. the greater part of the Podgora ridge was torn from the Austrians and some detachments reached the river at sunset. The Austrians defended themselves with the most obstinate valour. They counter-attacked frequently, and on the afternoon of Aug. 8, when they were finally driven across the river, they had gained precious time for their hard-pressed commander. Italian troops crossed the river the same night and the town of Gorizia was occupied next day without resistance, while a general attack on the Carso was breaking down the stubborn defence which had survived the loss of the summits of San Michele early in the first day's fighting. On Aug. 10 the Austrians were driven back across the Vallone, the deep cut that separates the San Michele–Doberdò section of the Carso from the main plateau. Only at the extreme S. of their line, on the low ridges above the Lisert marshes, did they succeed in preventing a break through their original lines of defence.

Both to the E. of Gorizia and on the far side of the Vallone the advancing Italians found themselves faced by new lines, hidden among the woody slopes beyond the town or the stony undulations of the Carso. Cadorna still hoped to go through, for it was not yet clear whether the Austrians were standing on a line which they had fully prepared, or whether they were fighting to cover a retreat to positions still farther east. Hoping to find a way round, and at the same time to prevent a concentration of force against the advance of the VI. Corps, he ordered an attack by the II. Corps from the Plava bridgehead, at the same time restoring the VI. Corps to the II. Army, and instructing the Duke of Aosta to continue his attacks on the Carso. The attack from Plava came to nothing—given the difficulties of the terrain, the artillery preparation and support, through shortages of guns and ammunition, was totally insufficient—and the VI. Corps was held up by hidden machine-gun posts. The information regarding the new enemy lines was meagre, and they were well concealed among the trees. Only the III. Army continued to make progress, and Cadorna broke off the action in the plain of Gorizia, deciding that careful preparation was necessary for an attack upon the new positions. He reënforced the artillery of the III. Army with guns taken from the II., and the Duke of Aosta carried on his attack for a few days more before it became evident that on the Carso also the enemy lines were too strong to be taken in the later stages of an offensive, with ammunition ebbing and troops already weary. The enemy troops, of course, were still more worn-out. Their reserves were all in line, and to back these were only broken units and march battalions. If Cadorna had been able to bring, immediately, a fresh weight of destructive fire to bear upon the new lines he would almost certainly have gone through. He was still handicapped by lack of material.

The loss of the Gorizia bridgehead was a serious blow to the Austrians, but the advance on the Carso was a still greater threat to their line as a whole. It gave the Italian III. Army ample room beyond the Isonzo, and an admirable line of observation posts. The Duke of Aosta's divisions were no longer attacking a formidable glacis, with every inch of their own ground under the observation of the enemy, and with no "eyes" themselves to view his country. And an advance upon the Carso, now rendered more feasible by the alteration in relative position, threatened to turn the enemy lines E. of Gorizia. To complete the scheme, it is clear, a simultaneous attack to the N. of the town was indicated. Such an attack was always in Cadorna's mind; it had been attempted more than once. But he had not been able, nor was he now able, to collect the means necessary to the simultaneous attack. His artillery strength, both in guns and shells, was altogether insufficient. He had to choose between the Middle Isonzo and the Carso, and he chose the latter, with Dornberg, the Iron Gates and the Hermada as his objectives.

This idea governed the operations on the Julian front during the rest of the year 1916. Three times Cadorna attacked on the main Carso plateau, between the Vippacco and the Brestovica valley, using the right wing of the II. Army in the Gorizia plain to support the main operation, the attack by the Duke of Aosta's left. The first attack, launched on Sept. 14 and pursued for three days, was affected by bad weather and gave disappoint-

ing results, though considerable progress was made. The handicap of bad weather continued, and delayed each of the two short, sharp blows dealt by Cadorna before winter closed down. In four days' heavy fighting in Oct. and three days' still fiercer struggle at the beginning of Nov., the Duke of Aosta punched out a big salient on the northern half of the Carso, driving the Austrians back to their last line of trenches and occupying the important position of Faiti Hrib. In each of these three actions the attack was broken off as soon as it slowed down. The second and third were in fact only preparatory actions, not offensives on the grand scale. Previous experience had shown that more men and more guns and shells were necessary for a successful attack on a wide front; and it had now become an axiom that only with a wide front of attack was success possible. Cadorna was ready to strike another blow if the weather had let him, but winter came early with heavy mists and much rain, and in Dec. he decided that he must reserve his strength for the following year.

The early advent of winter put a stop to other operations, in the mountain zone, which had borne considerable fruit. Good progress had been made in the region of the Fassa Alps, towards the Val d'Avision, and in Oct. an attack N. of Pasubio gained a wide stretch of high plateau which gave additional depth to the Italian defensive position and freed some 10 m. of the Vallarsa road from direct observation and worrying fire. Both here and in the Fassa Alps bad weather put an end to active military operations in the middle of Oct.; and an attack in the Asiago uplands, which was planned for the middle of Nov., had to be given up owing to the heavy snows that came a few days before the date was fixed.

The year had seen much heavy fighting, and both sides had suffered severely. The Italian casualties were nearly 120,000 dead, 285,000 wounded and 78,000 prisoners. The bulk of the latter were taken in the first days of the Austrian offensive in May, when the front lines, too full of troops, were overwhelmed, and a number of detachments were cut off in isolated mountain positions. The Austrian losses were also heavy. The *Straf-expedition* is said to have cost about 100,000 men. The Italian offensives on the Julian front, from Aug. to Nov., yielded more than 40,000 prisoners to the attacking forces, and the list of killed and wounded during these months came not far short of 100,000. If the territorial gains at the end of the year's fighting were not great, Cadorna's continued attacks, following upon the costly failure of the Austrian offensive in May, had done their work in occupying an increasing number of the enemy's troops and wearing down his powers of resistance. The Italian casualty list, as was the rule with the attackers, greatly exceeded that of the Austrians, but the advantage of man-power lay with the Entente, and the policy of attrition was generally, though not universally, accepted as indicating the only road to victory. No other policy, certainly, was open to Cadorna while the plans of the Allies were based upon this idea. His rôle was clearly marked out: he had to hammer when he could, with what means he could collect from month to month as the output of guns and munitions increased and fresh troops were trained, keeping always in view as an essential aim that of attracting to his front, and wearing out, the maximum number of enemy forces. Judged from this standpoint, the Italian effort in 1916 was of the greatest value to the Allied cause. Some 35 Austrian divisions, with their march battalions, were pinned to the Italian front; and Ludendorff in his *Memoirs* refers to the impossibility of detaching any Austrian troops from the Italian front to assist in other operations, notably to continue the operations against Rumania.

Although Cadorna was strongly opposed to the dispersal of his forces in *petits paquets* and had resisted the suggestion of an expedition to Libya to quell the rising which had reduced the Italian occupation to a few points on the coast, the importance of the Balkan front had not been lost sight of by the Italian Government. In March a strong force was dispatched to strengthen the Italian position at Valona. The Austrian attack on the Trentino caused two divisions to be recalled to Italy almost at once. It is worthy of note that the Albanian expedition was dispatched at a time when Italy was being criticized in the British and French press for her supposed refusal to coöperate in the Allied operations towards the Balkans. That coöperation was only delayed. When the situation on the Italian front permitted, fresh troops were sent to Albania, and in Aug. a strong force arrived in Salonika under the command of Gen. Petitti di Roreto to take part in the Allied advance upon Monastir. Early in Oct. an Italian column occupied Argyrokastro and before November the Italians were in touch with the left wing of the Allied forces based upon Salonika.

Up to the end of 1916, except in the case of the Balkan campaign, the question of military coöperation between the Allies had been confined to the timing of the individual efforts on each front, so as to minimize the advantage possessed by the Central Powers by their possession of the interior lines. The suggestion was now put forward that a wider meaning should be given to the word coöperation, that an Allied force should join the armies of Italy in an attempt to "knock out" the weaker of the two enemy Powers and so hasten the end of the war. The idea had been the subject of discussion in Italy in 1916, but the formal proposal was made Jan. 1917, during the Allied Conference held in Rome. The chief work of this conference, on the military side, was the organization of a line of communications through Italy to Salonika, *via* the south Italian ports, a route which greatly lessened the dangers from submarine attack, and at the same time made a much smaller demand upon the diminishing tonnage of the Allies; but the question of a joint offensive on the Italian front was also discussed. The French and British general staffs were against the proposal which came to be known as "Cadorna's plan," but it appealed to Mr. Lloyd George, who was in favour of Allied troops and heavy guns being sent to Italy, in order to add that extra weight to the attack which, to judge from the experience of 1916, would lead to important military successes. In spite of Mr. Lloyd George's advocacy, the French and British military authorities decided that they could not spare the men and guns asked for, but they offered to send 300 heavy guns for an immediate offensive, on condition that they were returned to the French front by the month of April, in which it had been decided to launch a general offensive. This offer was refused by Cadorna, on the ground that the season was not suited to an offensive on his front, and that the guns would have to be returned at the moment when they would be most useful. The discussion and rejection of Cadorna's plan gave rise to many rumours, among them the report that he had asked for "a million men or nothing." This legend found consecration even in serious commentaries published after the war.

Cadorna's actual proposals, embodied in a memorandum written after the Rome Conference, were as follows: If the Allies would send at least 300 heavy guns he would make two attacks, on the Trentino and Julian fronts—his own artillery was insufficient for this double offensive—and so find the enemy's weak point. He had the advantage of interior lines, and would move his reserves of guns and men from the Venetian plain according to the development of the two actions. If, on the other hand, the Allies would send a minimum of eight divisions in addition to the heavy guns, he would concentrate upon the Julian front and attack from Tolmino to the sea, with the object of breaking through towards Laibach. Such an attack, in Cadorna's view, would have had decisive results. He believed that Austria could not recover from such a blow.

The plan was tempting, but it did not commend itself to the Allied commands. French and British military opinion was against any further diversion of effort from the western front, for there was the chief enemy, upon whose defeat the result of the war depended. Great things were hoped from the offensives which had been planned for the spring, and it was not realized that Russia's active military contribution to the Allied cause, so valuable in the past, was practically ended; still less was it foreseen that before the finish of the year the Russian front would cease to exist at all. It was realized that Cadorna was

short of munitions, but he was stronger than he had been in 1916, when he had pressed the Austrians very hard. There was reason to think that he and Brussilov between them could be trusted to deal with the hard-tried armies of the Dual Monarchy, even though these were reënforced by German armies in the east. There were, moreover, obvious technical reasons against the choice of the Julian front for a joint offensive. The front lay far from the French and British bases and from their munition factories, and communications from France to Italy were not too good. On the other hand, Cadorna was right in pointing out that on the Isonzo front the enemy was more vulnerable than anywhere else in the whole western theatre of war, and that the Habsburg Monarchy was "less disposed to persist in the struggle" than Germany. An advance on the Julian front would have the great advantage of carrying the war well into enemy territory and so bearing more directly upon the resisting power of the people.

There were excellent arguments for both plans, but it is not surprising that the "Westerners" prevailed. If it had been realized that Germany and Austria were one for the purposes of the war,—if the Italian front had been regarded as the right wing of the front in the W.,—a different decision might have been reached. But at this stage the tendency was to distinguish between Austria and Germany and rather to consider the Italian operations as being linked up specially with the war in the East. Still, the idea which was brought forward in Rome did receive consideration during the following months, and in the spring of 1917 both Nivelle and Robertson visited the Italian front. These were the first visits of any important British or French military authorities since those of Joffre and Kitchener in the autumn of 1915, and the occasion was taken by Cadorna to press the question of closer coöperation, especially in the event of an Austro-German offensive against Italy. Both Nivelle and Robertson agreed to the principle of direct coöperation by the dispatch of troops and guns, but both were inclined to prefer coöperation by a simultaneous attack, and, while a scheme for the quick transport of troops from France to Italy was prepared, no definite engagements were taken. It was agreed, on the other hand, between Cadorna and Nivelle that the French and Italian spring offensives, which had been provisionally planned at Chantilly the previous autumn, should be timed to coincide as nearly as possible. The Chantilly agreement had in view an attack in Feb. but the date was deferred till April. In the meantime the Austrian forces on the Italian front were considerably increased, and the fact of the German retreat in France, which upset the French and British plans, seemed also to increase the possibility of an Austro-German offensive on the Trentino front, or even of the double attack on the Trentino and Julian fronts which had strong advocates in Austro-Hungarian military circles. The prospect of an attack from the Trentino seemed to be increased by the fact that Conrad, who had been replaced by Arz von Straussenburg as chief of the general staff, was now in command at Bozen. Cadorna held that he could not attack on the Julian front until he could feel reasonably safe in regard to the Trentino, for his offensive would imply the weakening of the Trentino front, especially in artillery. His request for guns had not been met, and to give his attack a chance he had to strip the Trentino front of its heavy artillery. His case seems unanswerable, but in March Nivelle demanded the assurance that Cadorna would attack in the middle of April and suggested diplomatic pressure upon the Italian Government. Cadorna maintained his position, that he would attack when the situation in the Trentino permitted him to move eastward the heavy guns he required for his offensive. In April he received 11 batteries of British 6-in. howitzers and 35 French heavy guns, but this assistance, useful though it was, fell far short of the requirements he had indicated. Thirty days after launching his ill-fated offensive, Nivelle called upon Cadorna to attack, but the latter had already given the order fixing the date of May 7. Bad weather caused a short delay, but the Italian guns opened fire on May 12. But for the weather Cadorna would not have exceeded the margin of three weeks by which the Chantilly agreement had enlarged the expression "contemporaneous." The threat from the Trentino obviously justified a delay, but even with this handicap Cadorna succeeded in attacking within, or nearly within, the limits allowed by the provisional agreement. In the circumstances it is difficult to understand Nivelle's attitude or the comments made at the time, still less the criticisms published after the war.

Cadorna attacked on the morning of May 12, feinting with the III. Army on the Carso, and making his real attack against the hills N. and E. of Gorizia. North of the town the greater part of the long ridge (Kuk Vodice) running southward from above Plava was gallantly stormed and held against the most determined counter-attacks, but on the hills E. of the town little progress was made. As soon as the occupation of the Kuk Vodice ridge seemed assured Cadorna moved the bulk of his heavy guns southward, and attacked with the III. Army on the Carso. Lack of guns and ammunition made it impossible to attack in both sectors at once. Useful progress was made here also, a number of enemy positions being captured on the Carso proper, and the VII. Corps on the right carrying one line after another till they were half-way up Monte Hermada, which dominated all the southern Carso and was the enemy's main bastion in this sector. But ammunition was running low: the offensive had to be broken off at a moment when it seemed as though further success lay very near.

There was only a short breathing space. On June 4 the Austrian troops on the Carso, now grouped under the command of Gen. Wenzel von Wurm, counter-attacked in the most determined manner. Against the Italian left and centre they had no success, but on the right they found a weak resistance on the part of the troops who had come into line as reliefs. They freed the lower slopes of the Hermada and took a large number of prisoners. This was the limit of Wurm's success, though his attacks were conducted with great determination and his artillery fire was both accurate and intense. If Cadorna had been able to increase his artillery, his adversary had kept pace. The Austrian gunfire, both in defence and attack, was far heavier than it had been in former actions.

During the four weeks' fighting Cadorna used 31 divisions, and his casualty list was very heavy: 132,000 killed and wounded. He also lost more than 25,000 prisoners, the bulk of them due to the weak resistance in the Austrian counter-offensive in the Hermada region, though a considerable number of captures were those of troops who had pushed on too far in the Italian attacks. Boroevich had held his ground, or nearly, with 17 divisions, and his losses, including 25,000 prisoners, were close upon 120,000. Once more he had been pushed to the last extremity, and once more the fighting power of his troops and an ample supply of machine-guns had checked the Italian effort, handicapped as it was by lack of ammunition for the guns.

The rumour of battle had scarcely ceased on the Julian front when the Italians attacked N. of Asiago, in an attempt to drive the Austrians off the line which they had occupied after their offensive in 1916. The Italian attacking force consisted of 12 divisions, with 1,500 guns and trench-mortars, and the front did not exceed 9 miles. In spite of the strength of the forces employed and the weight of fire brought to bear upon the enemy lines, the general attack was a failure. On the extreme right alone, in the region of Monte Ortigara, the Alpine troops of the 52nd Div. made good headway and captured 500 prisoners. The left wing also gained ground to begin with, but could not maintain their success. Bad weather interfered with the artillery work, and the troops suffered very heavily. The feeling was general that the Austrian positions were nearly impregnable, and some of the troops fell below the usual standard. After a pause the Alpine troops renewed their magnificent effort, gained more ground in spite of the extreme difficulty of the terrain, and captured another 1,000 prisoners with several guns. But their advance left them in an impossible position, completely dominated by the enemy's reserve lines, and largely isolated from the rest of the Italian force. The Austrians brought up strong reserves of guns and men, and after a heavy artillery fire, which

caused heavy losses among the troops who were lying on the bare rocky slopes of Monte Ortigara, they counter-attacked in force. The *Alpini* were driven off the summits of the Ortigara, but after a long struggle kept the Passo dell' Agnello.

The Italian losses in this abortive action were very heavy indeed, 24,000 killed and wounded and 2,000 prisoners, and it was commonly felt that in view of the initial failure farther S. it was a mistake to persist in the attack upon the Ortigara positions. An isolated success at this point was useless, as it could lead nowhere. The officers in command of the *Alpini*, who knew what was possible in such difficult conditions of terrain, were opposed to the further attempt and their misgivings were fully justified. The record of the Alpine battalions was proof that they had no objection to attempting the impossible if there were sound reason for the attempt. On this occasion they felt that their sacrifice was useless, and though they fought and died as staunchly as ever, the remnants who came back from the Ortigara had the bitterness of failure.

The general situation at the end of June gave cause for disappointment and some anxiety. The big battle on the Julian front had come very near triumphant success. It had brought the Austrians close upon disaster, and it had shown once more that with a little added weight, especially of heavy guns and shells, the stubborn resistance of Boroevich might have been overcome. But the balance was swinging against the Entente. The whole military situation threatened to be altered by the disorganization which had followed upon the Russian revolution. While it was not yet fully clear that the revolution meant the defection of Russia, it had already meant the possibility of a considerable transference of guns and men from E. to W., and it had heartened the weary soldiers of Austria-Hungary. The prisoners taken by the Italians boasted that the whole effective strength of the monarchy would shortly be concentrated against Italy; and the information that came from the East all tended to confirm the fear that the Russian front, which had filled such an important part in the war for nearly three years, would shortly become a vast rest-camp for the soldiers of the Central Empires.

Russia was going out of action, and the consequences for the Western Allies showed clear enough. Nor was it only in Russia that signs of war-weariness had made themselves evident. This was in fact the critical year. France for the first time, after the failure of Nivelle's offensive, had to deal with serious disaffection in the army which had borne the heaviest burden, and suffered most, of the Western Allies. In the case of England, though the army was sound, there were disquieting symptoms among the population. In Italy war-weariness was showing itself in various ways. The troops who failed on the slopes of the Hermada had displayed a mutinous tendency before going into line, and in the attack in the Asiago uplands some of the units had shown less than the usual spirit. Cadorna was disturbed by these manifestations, especially by the first, which he put down to "defeatist" propaganda in the country. He addressed urgent protests to the Government, claiming that the Ministry of the Interior did not show sufficient severity towards anti-war propaganda. The fact of war-weariness could not be disputed, and there were ample reasons for its existence, both in the army and in the country. Units were kept too long in the trenches, partly because the wearing effects of these long spells were not fully realized, but partly also because the number of troops available was small in relation to the length of the front, which was nearly as long as the Allied front in France. Nor was it then generally understood that the soldier who comes into rest billets requires "remaking" as well as rest. In the first place, little or nothing was done in the way of providing comforts and recreation. It was only in the summer of 1917 that recreation huts began to be established and the idea of organizing amusements found favour with the authorities. Another lack was the almost complete absence of the volunteer canteens near the front which proved so useful in France. For his modest additional comforts the Italian soldier had to depend almost entirely upon the speculative ventures of small dealers who made large profits. And the pay of the soldier gave him no margin for such expenditure. There was little to soften the hardships or lessen the dreariness of life in the war zone.

In the second place, the rest periods were not utilized as they might have been for the training of the troops in the methods of warfare that experience was constantly developing. The loss was double. Both officers and men suffered from lack of knowledge and practice, and, not less important, they suffered from *ennui*. They were either occupied in dull fatigue duties, or, in many cases, they were not sufficiently occupied at all. Too often they had little to do but to wonder when the war would come to an end. Socialist newspapers preached that the enemy was ready for peace, and among the new drafts were some who told the same story. Anti-war propaganda was active both in the country and in the army, and neither at the front nor among the public was there efficient counter-propaganda.

Another reason for depression was the actual shortage of food, both in the army and in the country. Conditions had grown very difficult in Italy. The soldier's ration had to be cut down to a very low standard, so that the lack of extra comforts was all the more severely felt. And at the same time the troops were distressed by the news that their families were suffering want, and even actual hunger. The allowance to soldiers' families was altogether insufficient in view of the great rise in the cost of living. In all these ways the strain upon the army was far greater than that experienced by the troops of England or France. To those conversant with the conditions it was a matter of surprise, not that there was discontent here and there, but that the willingness and cheerfulness of the troops as a whole triumphed over circumstances that tried them so hardly.

There was reason for anxiety owing to war-weariness, but there were many signs of the same trouble in the enemy's camp. It was felt that Austria-Hungary was very near the end of her tether, and subsequent revelations showed how grave the situation was. The chief cause for anxiety lay not in the occasional symptoms of weariness, which had become evident elsewhere as well as in Italy, but in the hard fact of the Russian catastrophe. The effect of this disaster was both material and moral. It definitely altered the military balance, and, while it encouraged the Central Empires to go on, it clearly removed to a distance the prospect of an Entente victory with which the year had opened. The advocates of "peace without victory" were heartened in their efforts to show that a continuance of the struggle was useless.

The military situation was changing for the worse, but there seemed a chance of striking the enemy hard before he could definitely ignore the eastern front. At the end of July there was a further inter-Allied discussion regarding plans, in Paris first and then in London. In Paris, Cadorna was urged to undertake two big offensives, one in Aug. and one in Oct., but it was not difficult for him to show that his supply of shells would not permit of two attacks on the grand scale. Nor were his trained reserves adequate, in view of the casualties with which he had to reckon. The discussions were continued in London, when Cadorna had returned to Italy from Paris, and the idea of a joint offensive on the Italian front was brought forward again by Gen. Albricci, who represented Italy. It was clear that such an attack could not be undertaken at once, in view of the great Flanders offensive which had just begun, and from which so much was hoped. Albricci's proposal was to delay the Italian offensive planned for Aug. until the Allies could spare troops and guns to give the added weight which experience had shown to be necessary. The idea was not at once rejected on this occasion. The suggestion was made that Allied reënforcements should be sent in Oct., when it was hoped to have reached objectives set for the Flanders attack. Albricci feared that this might mean losing the favourable season for an Italian offensive. The experience of the previous year had shown that the autumn mist and rain on the Isonzo front were a serious handicap to artillery fire, and the counterveiling advantages to an attack were not yet realized by the

Allies. It was decided to keep to the Paris plan and attack in Aug. without reënforcements. The efforts of the Italian munition factories and depots had provided many new heavy batteries, and there were now 99 British and French heavy guns on the Italian front. Altogether Cadorna could dispose of 2,300 heavy guns for his attack.

The army was strung to the highest point of tension, awaiting the order to attack, when Pope Benedict XV. launched his appeal for peace. A forecast came first, in the clerical press, on Aug. 14. Next day, the festival of *Ferragosto*, there were no newspapers, but the text was published on Aug. 16. Forty hours later Italian guns began, from Monte Nero to the sea; and on the night of Aug. 18 the offensive began. Parts of the army were shaken. For the Pope in his impartiality placed the two contending groups of Powers on the same level; he held out the hope that Germany and Austria were ready to consider certain territorial questions "in a conciliatory spirit," taking into account "the aspirations of the peoples"; and to the long and weary struggle he attached the label "useless slaughter." The Papal Note in itself was vague, and promised little. But it hinted much, and some of the press comments upon it filled in the gaps. The word ran round that a peace might be arranged which would give Trentino and Trieste to Italy. Some of the commands were anxious about their men when the attack began.

As a matter of fact the troops put aside their questionings, and the blow dealt to the Austrians was a very heavy one. The Isonzo was crossed in many places between Tolmino and Plava, and the greater part of the Bainsizza (Bainsitsa) plateau was occupied by troops of the II. Army, while the southern end of the Chiapovano valley was passed, and a footing obtained on the western corner of the Ternova plateau. No progress was made against the positions E. of Gorizia, and the action in this sector was quickly broken off, but the right wing of the III. Army gained ground, especially on the southern edge of the main Carso plateau and in the Hermada sector. The Carso action was broken off when it was clear that the initial impetus would carry the troops no farther, and guns and men were moved N. to endeavour to make the most of the success gained by the II. Army. The extreme difficulty of the country and, above all, the lack of roads called a halt after 10 days. The infantry had outrun the heavy guns in position on the right bank of the Isonzo, and they found the Austrians, as the pressure relaxed, strongly placed among the hills to the W. of the Chiapovano valley. Capello's II. Army had won a big victory, but at two vital points the Austrians had held their own, on the Lom plateau S. of Tolmino and on Monte San Gabriele, N.E. of Gorizia. While these positions were maintained the Italians could not obtain the fruits of their initial tactical success in breaking through the lines on the Bainsizza.

Little progress had been made by the left of the Italian attack. Austrian reënforcements had been hurried to the spot, and an immediate renewal of the attack, without further preparation, did not commend itself to the Italian command. It was decided to concentrate against the Austrian centre, and attempt the capture of San Gabriele, while the troops on the Bainsizza dug in and roads were made from the left bank of the Isonzo to join those leading to the old Austrian positions. In spite of prolonged and furious bombardments, and infantry attacks renewed again and again, the defenders succeeded in maintaining their principal line of resistance on the battered mountain, though they were driven off more than once. With the failure of the attack on San Gabriele, the hope of finding, at least, a way through the defences of the Gorizia zone was abandoned for the time.

Cadorna hoped to renew his offensive at the end of Sept., when he had rested his troops and replenished his supply of shells, by an attack against the Ternova plateau, in the hope of definitely turning the Gorizia positions from the N. and cutting the main line of communications between the Austrian right and left. The III. Army was to hold the troops on its front and pass to the attack when the right wing of the II. Army had made the necessary ground. The drawback to this plan was that it left the Tolmino bridgehead in undisturbed possession of the Austrians, and by advancing the Italian right increased the danger which would come from an Austrian drive in this sector. But Cadorna had faith in the natural and prepared strength of his positions opposite Tolmino, and if he were to succeed in his attack upon the Ternova plateau, the chances were that his adversary would be too busily employed to attack his left at Tolmino.

Towards the middle of Sept. news came of increased enemy forces and a probable counter-offensive at an early date, and when Cadorna took stock of his forces he decided that he could not go on. He came to this decision on Sept. 18, and on that day he gave orders to the II. and III. Armies to "concentrate all their activities in preparations for defence." At the same time he communicated his decision to the Allied commanders, explaining his reasons. Unfortunately, there was a misunderstanding caused by a hasty and incomplete transmission of Cadorna's memorandum to the Allies. The first news received by Gen. Robertson did not give Cadorna's reasons for suspending his offensive action, and the result was a telegram which said that the 64 British guns sent to the Italian front had been given for offensive purposes, not for defences, and requested their withdrawal. A similar request came from France, for the return not only of the 35 guns which had been in action already, but of a further reënforcement of 102 guns which were arriving. Cadorna at once ordered the guns to be returned, but he pointed out that he was the only judge of what should or should not be done on the front for which he was responsible, and he took very natural exception to the tone of the communications which he received from England. The arrival of Cadorna's explanatory memorandum relaxed the tension, and some of the British batteries were left in Italy. The others, however, were sent to Egypt, and the French guns were withdrawn. This misunderstanding emphasized the drawbacks of the absence of a permanent inter-Allied war council, which was only to come into being when disaster had taught a further lesson.

Cadorna's reasons for suspending his offensive, or rather for giving up the idea of a new attack, can hardly be questioned. The four weeks fighting in Aug. and Sept. had cost him over 166,000 men—40,000 killed, 108,000 wounded, and over 18,000 prisoners. His casualties from May to Sept. reached the total of 92,000 killed and 226,000 wounded. The toll taken by sickness had also been very heavy. There had been much malaria among the troops in the low ground near Monfalcone. a severe type of jaundice had made its appearance in various parts of the front, and the II. Army had suffered severely from an intestinal epidemic which had been prevalent in the Judrio and Natisone valleys. The units were at a low strength, and the new drafts had not been satisfactorily absorbed. A breathing space was urgently needed.

A number of Cadorna's critics have urged that the best way of meeting the forthcoming enemy attack was to anticipate it by renewing his own offensive. But the weakness of his units and the shortage of ammunition made it very doubtful whether he could win even an initial success. The one thing certain was that he would suffer heavy losses and reduce to danger-point his limited reserve of shells. He had to look forward, and face the fact that if strong enemy reënforcements were already coming from Russia these were only the advance-guard of what was to be expected within a few months. If he were to gain the small amount of ground that seemed all he could hope for, he would find himself in a much less favourable position to meet a later attack from still stronger forces.

The Austro-German success against the II. Army, and the subsequent retreat of the Italian forces to the line of the Piave, and the resistance in the new positions, are fully described in a separate article (*see* CAPORETTO, BATTLE OF), and only a bare record of facts need to be given here. The Austro-German forces under the command of the German General Otto von Below (XIV. Army), divided into four "groups," attacked the left wing and centre of the Italian II. Army on the morning of Oct. 24. The Italian line was pierced between Tolmino and

Caporetto, and by the afternoon of the 24th the situation was already serious. Owing to a complex of causes the situation grew rapidly worse. The Italian left wing crumbled, and on the night of Oct. 26–7 the order was given to retire beyond the Tagliamento. This was only a first step in the move decided upon by Cadorna. In view of the breakdown of the II. Army and the danger of attack from the N., Cadorna decided that it was essential to shorten his line by a retreat to the Piave. He had already foreseen such a contingency (*see* ASIAGO, BATTLE OF), and after the failure of the Austrian offensive of May 1916 he had given orders for the preparation of a line of defence on the mountain ridges between the Piave and the Brenta and to the N.E. of Asiago.

By the end of the first week in Nov. the Italians were in line W. of the Piave. The III. Army, reënforced by the VII. Corps of the II., held the greater part of the river line, and was in touch with the IV. Army, which had come down from Cadore and occupied the northern sector of the river line and the mountains between the Piave and the Brenta, where it had established contact with the right wing of the I. Army. The remnants of the II. Army and the Carnia force were being reassembled in the Venetian plain.

In the meantime France and England had acted with all possible speed. As soon as the gravity of the situation became apparent the order was given for six French and five British divisions to entrain for Italy, precedence being given to the French troops, and Foch and Robertson hastened to the spot. Foch arrived at Treviso, where Cadorna had been for three days, on the morning of Oct. 30, and the situation was fully discussed. Cadorna felt that the troops available for the defence of the Piave line were dangerously weak in numbers, the more so as he was anxious to detach two divisions of the III. Army to reënforce the line W. of Lake Garda, where there were rumours of intended attacks, and he suggested to Foch that as soon as the French troops arrived they should go into line on the Montello, between the III. and IV. Armies. Later in the day, having received further news regarding the threat W. of Garda, he asked that Foch should detach a French division to reënforce this sector. Foch was unwilling to divide the French X. Army, and it was finally agreed that the French, as they arrived, should be aligned between the Mella and the Adige, ready to reënforce the I. Army in case of necessity, the defence of the Piave line being left to the Italian troops. Foch agreed with Cadorna's dispositions for the defence of the Piave line, but he was naturally much preoccupied by the appearance which the situation presented: weary disheartened troops, insufficiently provided with guns and ammunition and relatively weak in numbers, facing a greatly superior army flushed with a victory that had exceeded all hopes. And behind these, their only reserve, with the exception of the young boys recently called to the colours and a limited number of troops from the depots, was a great mass of broken troops largely without arms and equipment, who had lost order in the immense confusion of the heavy retreat. These troops, disorganized, worn-out, sullen and bewildered, might well have seemed more of a danger than a potential reserve of strength. There had been a failure in *moral* among certain units in the first phase of the fight. It had spread during the retreat. None could be sure how far it had gone or would go.

The Italian losses, both in men and material, had been enormous. To the casualties suffered in the enemy attack upon the II. Army, some 10,000 killed and 30,000 wounded, were added some 230,000 missing, who had already surrendered, or were still fighting hopeless isolated actions among the mountains, cut off and doomed. The retreat was not yet over, and the list was sure to be swelled still further. Many guns which had been brought safely as far as the Tagliamento had been lost owing to the premature destruction of the main bridges between Codroipo and Casarsa. When the material losses came to be calculated, the figures were as follows: 3,152 guns, 1,732 trench mortars, 3,000 machine-guns, 2,000 "pistol" machine-guns, considerably over 300,000 rifles, and an immense mass of stores and war material of every kind.

On Nov. 4 Mr. Lloyd George, Gen. Smuts, Gen. Sir Henry Wilson, M. Painlevé and M. Franklin Bouillon arrived at Rapallo, and were there met by Gens. Foch and Robertson, Signor Orlando (who had just succeeded Signor Boselli as Italian premier), Baron Sonnino, the Foreign Minister, Gen. Alfieri, Minister of War, Gen. Porro, sub-chief of the Italian general staff, and M. Barrère, French ambassador in Rome. From the Rapallo discussions were born the Supreme Allied Council which was to meet, once a month if possible, at Versailles, and the Versailles Military Council, which was to sit permanently. It was agreed that the failure of the Italian armies to resist the enemy attack called for a change in the Italian command, and Cadorna was appointed Italian military representative at Versailles. He was succeeded by Gen. Armando Diaz, commander of the XXIII. Army Corps, and the functions of Gen. Porro, who was also relieved of his post, were divided between Gen. Giardino, who had been Minister of War during the summer, and Gen. Badoglio, commander of the XXVII. Corps. These were all comparatively young men, who had come to the front during the war. Diaz was not yet 56, Giardino was 53, and Badoglio was only 46.

The moment was critical in the extreme, for the reasons given above, but the work done by Cadorna during the last days of his leadership had laid solid foundations for the wonderful recovery that put a term to the enemy advance. Cadorna's conduct of the great retreat was a masterpiece of military skill and cool judgment, and he had long ago made his plans for a defensive battle on the Piave line.

A legend was put about both in France and in England that the Italian command wished to continue the retreat to the line of the Adige, and it was asserted that only Foch's intervention prevented this further retirement. The legend had no basis of fact. Both the Italian and Allied press indicated the possibility of a further retreat, and their opinion was no doubt inspired by soldiers who realized the dangers of the situation and by politicians who wished to prepare opinion for the possibility of a further enemy success. But neither Cadorna nor Diaz had any intention of leaving the Piave line, unless, of course, the step was compelled by a new defeat. The line of the Piave was to be defended "to the last." Cadorna's orders are quite explicit, and he never entertained the idea of a retreat to the Adige unless he were forced back from the Piave line, or had his flank turned by an attack from the north. Diaz was no less resolved that resistance on the Piave line was the only possible course. An order of the day published by Cadorna on Nov. 7 fixed the Piave as the line on which "the honour and life of Italy" must be defended, and this blunt statement unhedged by reservations, frightened the politicians. They feared that after such a statement the effect of further disaster, if it should come, would be more serious. But the soldiers realized the mistake of playing with the idea of a further "strategic retreat," and when Diaz was asked his view, he said plainly that he would resign rather than carry out such a plan.

Both Cadorna and Diaz, who succeeded him on Nov. 9, were convinced of the necessity of standing on the Piave, and they had good hopes that their troops would hold. The Allied commanders were equally against any further retreat, but they were strongly impressed by the uncertainty of the situation. The break-through at Caporetto was universally attributed to a failure in *moral*. Since that failure the Italian armies had undergone the trial of the retreat, and they were weakened by great losses of men and material. Would they "come again," or would their *moral* suffer a more widespread breakdown under a new strain? It was natural that both British and French commanders should hesitate to send in the Allied troops to the front to stiffen it by units as they arrived. There was the chance that they might be involved in a fresh disaster, and in the circumstances it was obviously more prudent that both French and British armies should be held intact on a reserve line. The French X. Army stood behind the Italian I. Army, while the British divisions under Gen. Plumer, which began to arrive as soon as the railway communications from France

were free from their transport, were detrained at Mantua and assembled near the Adige.

On Nov. 10, the day after Diaz took over the command from Cadorna, came the first enemy attack against the new lines, a tentative action on the Middle Piave, but after several unsuccessful attempts to pierce the line W. of the river, the Austro-German efforts were concentrated on the mountain front, between Asiago and the Piave. The main thrust was between the Brenta and the Piave, where a desperate struggle raged for weeks, though Conrad gained ground in the Asiago uplands, and might perhaps have gained more if he had been given the reënforcements for which he called in vain. The critical period was the fortnight from Nov. 10–25, and the end of the month saw the line fairly established. The Austro-German attack was to continue for another four weeks, and the Italians were to lose more ground in the mountains, more prisoners and some guns. But the crisis was past.

At the end of the third week in Nov. the Allied divisions began to move up to the front, and at the beginning of Dec. they took over the sectors assigned to them, three French divisions occupying the Monte Tomba–Monfenera ridge W. of the Piave and a similar British force holding the Montello sector, on the Middle Piave. It was expected that the enemy would attack at both these points, but throughout Dec. Boroevich's Isonzo army lay practically idle to the E. of the Piave, nor were the French attacked. The aim, naturally, was to attack as far W. as possible and so turn the Italian positions from the N., and compel a further retreat. Conrad in the Seven Communes and Krauss in the Grappa sector hammered in vain, favoured by the late coming of the snow, but hampered by bad weather and insufficient communications. Their efforts were fruitless. On both sides of the Brenta the Italians fought them to a standstill, and on Christmas day the long struggle ended, with the Italians counter-attacking, and the enemy hard pressed to hold the slight advantages they had won.

The Italian recovery on the Piave–Grappa line, that great triumph over disaster and despair, was one of the most remarkable achievements of the war. On the result of the fighting in those November days depended the ability of Italy to continue playing a principal part in the world-struggle. Further defeat would not have meant submission, for the Austrian invasion had stilled the questioning voices and bound the nation in one resolve. But further defeat, with its consequent loss of war material and territory, would have so weakened Italian military strength as to render still more critical the position of the Allies. If Austria had been able to assist Germany the following spring, the course of the 1918 campaigns would certainly have been changed. Hence the service rendered to the Allies by the men who held fast on the Piave and in the mountains was incalculable.

During Nov. and Dec. the Italian armies suffered further heavy losses, some 20,000 killed and 50,000 wounded, and the total number of prisoners lost in the last three months of the year, including those belonging to labour battalions and the sick and wounded left behind in hospitals or on the field, was increased to 335,000. The total loss in men from Caporetto to the end of the year was close upon 450,000. When to these are added the disorganized troops of the II. Army, and the Carnia Force and the stragglers from the III. Army, the temporary loss may be calculated at 750,000. But the prompt arrival of the British and French troops and the quick reorganization of a portion of the broken units shortened the critical period. The Allied divisions, as has been said, were in position by the beginning of Dec., and before that time two corps of the II. Army had been reconstituted and had gone into line. Another followed immediately afterwards, and by the end of the year two others were reformed and ready. For the remaining three disbanded corps, which were reorganized as the V. Army, under the command of [illegible] Capello, late commander of the II. Army, a longer period was necessary. In the case of these units the loss of cohesion had been more complete, and, moreover, the supply of guns, rifles, etc., was insufficient to arm them. When they moved into the zone of operations in Feb. they were still partially equipped with French guns and rifles, but before long these were replaced by Italian material. In addition to the reorganization of these units, a system of march brigades was instituted for the retraining of stragglers and other troops superfluous to establishments.

The winter saw a comprehensive reorganization of the whole Italian army. There was a technical reorganization, based on a recognition of new war conditions, and greater attention was given to specialized instruction, both for officers and men. More important still were the measures taken for the welfare of the troops and their families. The shock of disaster and invasion had brought about a great reaction both in the army and the country, but it was clearly necessary to alter the conditions which had made some of the troops inclined to lend an ear to the peace propaganda which had been rife during the summer. Diaz devoted special attention to this work, and it would be difficult to exaggerate the value to the Allied cause of the great task of reorganization carried out by him during the winter.

After the failure of Krauss and Conrad to break through to the Venetian plain, the Italian front saw no action of first-class importance for nearly six months, but there were several minor combats worthy of mention. The first of these was a brilliant attack by a French division on Monte Tomba, which finally drove the Austrians down the northern slope of the ridge to the Ornio torrent. The artillery preparation was particularly destructive, and the positions were stormed with great dash. Nearly 1,500 prisoners were taken, and the French losses were insignificant. This attack was followed by two small Italian attacks, on the Lower Piave and on Monte Grappa respectively, which showed that the troops had regained their offensive spirit and, at the end of Jan., by a notable success in the Asiago uplands. Two important positions were wrested from the Austrians and held against repeated counter-attacks. More than 2,500 prisoners were taken, with six guns and 100 machine-guns. The only other important feature during the winter months was supplied by the Austro-German air raids against Padua and Venice and the little towns of the Venetian plain, and the activity of the Allied airmen along more legitimate lines.

Gen. Otto von Below and the German divisions left the Italian front at the beginning of 1918, in anticipation of the great offensive which was being prepared on the western front. Austrian and German divisions were now coming W. in increasing numbers from the Russian front, and it was clear that both armies would attack at the earliest possible moment. Gen. Plumer left Italy to take up his old command when it was evident that the German blow would come first. He had acquired a great popularity among all with whom he came in contact and his departure was much regretted. Fortunately he left in the Earl of Cavan an admirable successor.

The spring saw a change at the Italian headquarters. On the appointment of a commission to enquire into the Caporetto disaster Cadorna was recalled from Versailles and replaced by Giardino, who had shared with Badoglio the duties of sub-chief of staff. This appointment was only temporary, for shortly afterwards Giardino and Di Robilant changed places, Di Robilant going to Versailles and Giardino assuming command of the IV. Army.

When the German offensive in March 1918 pierced the line of the British V. Army four French and two British divisions were immediately withdrawn from Italy to reënforce the Allied armies in France. These were followed by the Italian II. Corps under the command of Gen. Albricci, which was to distinguish itself in the fighting W. of Reims. This left Diaz with 55 divisions (50 Italian and 5 Allied) as against 60 freshly organized Austrian divisions. The Austrian command had taken the opportunity of the winter lull to reorganize the army, of which 60 divisions were now concentrated on the Italian front, and, according to Krauss, the reorganization gave rise to great confusion and much unnecessary work and fatigue. It was probably due to this work of reorganization that the Austrian offensive which was expected in April was planned for the end of May or beginning of June.

The original proposal of the Austrian command was to make a drive on both sides of the Brenta and concentrate upon this single attack, but Conrad thought the sector unsuitable and pressed for an attack upon the line in the Asiago uplands. Krauss was consulted, and disapproved of both plans. He argued that the aim of an offensive must be the destruction of the Italian army, and that this could only be achieved by an attack farther W., on both sides of the Lake of Garda. A successful break-through by the Val Lagarina and the Giudicaria would cut off the whole Italian army, while the other attacks could do no more than force a retreat. He pointed out the great difficulty of movement, both of guns and troops in mass, in the Brenta and Asiago sectors, and claimed that his plan, based upon good communications, was in every way preferable.

Krauss's plan found no support, and it was arranged that Conrad should have his way. But Boroevich urged that the main offensive should be accompanied by a straight drive by his armies across the Piave. He apparently thought that this should be the main operation, and opposed the attack in the Asiago uplands, but a compromise was effected, and both army groups attacked on June 15. Conrad attacked with Scheuchenstuel's XI. Army, from S. of Asiago to Monte Grappa, the main drive being against the British and French divisions S. of Asiago, who had taken over this sector in March, while the Archduke Joseph attacked the Montello and Werzel von Wurm crossed the Lower Piave. Conrad had 27 divisions at his disposal, and Boroevich 23. Conrad's attack was a complete failure. It went well to begin with, but by the end of the day all hope of success had gone. Counter-attacks had retaken most of the positions lost in the first rush, and by the evening of June 16 Conrad was finally beaten. Boroevich on the other hand made good headway on the first two days. Though his principal attack, astride the Oderzo–Treviso railway, was immediately held up, he succeeded in establishing three bridge-heads across the Piave, and at two of these on the Montello and opposite San Donà del Piave, the attacking troops penetrated some distance westward. In various places the Italian front lines were quickly overrun, and many prisoners were taken. But a very thorough defensive system had been prepared, and while the front lines had been comparatively lightly held, there were ample reserves on the spot and within easy reach. After a week's fighting, at the end of which time the Austrians were being closely held within the limited room they had won, and had lost ground in various places to Italian counter-attacks, the order was given to retire across the Piave. Some days previously the attacking troops had been handicapped by the sudden rising of the Piave, but the river was falling again before the retreat was ordered and Boroevich, in a letter written after the battle, lays the blame, not on the Piave, but on Austrian headquarters, which had failed to organize the attack on proper lines and give the necessary supplies in time.

It is clear that the offensive suffered from the struggle between two opposite views, that of Boroevich and that of Conrad, and that strength was distributed instead of being concentrated. But Conrad probably had as many divisions as he could use in the sector he chose for his attack, and it is difficult to see that Boroevich could have won a big success even if he had been able to dispose of more troops. A concentration of force in the mountains and an extension of Conrad's attacking front farther W., to include the Val d'Astico and even the Val Lagarina, might perhaps have offered a better chance, but judging from the circumstances and issue of the fight it is hardly likely that any different plan would have led to a victory worth gaining. Even where the attack was initially successful, it was fairly held when the reserves of the defence came into play. The fact is that the Austrians had greatly under-estimated the Italian powers of resistance. Von Cramon stated that the spirit of the Austrian troops was excellent, and that every technical preparation had been made—that both Conrad and Boroevich reported in this sense to the Emperor.

The Austrian failure was costly, for the casualty list totalled over 135,000 and more than 24,000 prisoners were taken; but the moral effect of the defeat was far more important than the material loss, grave though that was. Few single weeks throughout the whole war saw more bloodshed, for the Italian list of killed and wounded was over 40,000. No single week, perhaps, up to this point, led to so evident a victory or marked so clear a turning point. The defeat on the Piave and in the mountains broke forever the offensive power of the Austro-Hungarian Empire, and the fact was plain to see. There was, moreover, a further significance in the Italian victory. It was the first Allied success of the year, and it came at the end of a period in which the resistance of the Allied arms had been tried to the uttermost. The message which Mr. Lloyd George sent to the Italian premier, Signor Orlando, gave full emphasis to the fact. "This great success has been a deep source of encouragement to the Allies. Coming as it has at the most fateful hour of the whole war, it is a good augury that the alliance of free nations will ere long free the world once for all from the military domination which has threatened it so long."

The defeat made a profound impression in Austria-Hungary, and led to much criticism of the army command. The discussion was specially bitter in the Hungarian Parliament, for the Hungarian troops had suffered very heavily, and it was alleged that the attack had been conducted with insufficient means. This charge was not borne out by the facts, and it was proved that the attacking armies were stronger in artillery and better supplied with shells than ever before, a comparison with the guns and shells available for the Caporetto offensive the previous year showing a very large increase. But the consciousness of impending disaster grew and spread through the monarchy and the troops were greatly disheartened by failure.

Prior to the Austrian attack the Italian command had had under consideration the question of an anticipatory offensive, on the Asiago plateau, with the object of gaining depth of position, and, if possible, of reaching the main Austrian line of communication between Trento and Feltre. When the extent of the forthcoming enemy offensive became apparent, this plan was given up and the Italian armies stood on the defensive. The general situation, and particularly the supply of guns and men available, did not allow the concentration on the Asiago plateau of a force sufficient to carry out the attack contemplated. When the Austrian offensive was broken and the armies of Conrad and Boroevich thrown back in disorder, the question of a counter-offensive on the grand scale was considered by the Italian command. Lord Cavan urged that the original plan should be carried out, and was of opinion that Conrad's troops were so demoralized that an attack in the Asiago uplands early in July would lead to a very important success. Local counter-attacks by Italian troops, both on the Piave and in the mountains, gave good results, important positions being occupied and many prisoners taken W. of the Brenta, in the Grappa sector and on the Lower Piave, but as the enemy put up a stout resistance and the Italian losses were heavy, Diaz did not feel himself strong enough to attack in force without further careful preparation. His armies on the Piave had suffered severely, he had only six fresh divisions on the spot, and, above all, as his report states, "the supply services—never very ample—had been severely strained and were quite unequal to fresh operations over a wide area." A general counter-offensive, to include an attack across the Piave, was not practicable without prolonged and careful preparation. The same considerations did not apply in equal measure to an offensive operation on the Asiago plateau, where there was no treacherous river to cross, but Diaz was preoccupied by the question of reserves. Excluding the boys of the 1900 class, who were being held in reserve against the possibility of the war continuing into another year (at that time the possibility was generally regarded as a probability, if not a certainty), his supply of men was little more than sufficient to make good the normal wastage of the next six months. An immediate attack in the Asiago uplands might very well have led to important results—looking back after the event with further information available, the chances of success can be seen

more clearly—but at the moment the general circumstances of the war seemed to impose caution. In July Germany was still on the offensive, though the failure E. and W. of Reims in the middle of the month and Mangin's great counter-blow a few days later were finally to put an end to all hopes of victory on the western front. But Diaz had to count upon his own resources, and he had to take into consideration the possibility that Germany might succeed in establishing a defensive front in France, and join Austria-Hungary in a last attempt against Italy. He had to be prepared for defence as well as attack, and his weakness in man-power and material enjoined caution. He decided to wait until his units were remade, his stores of ammunition replenished, and his supply services reënforced. Plans were drawn up and preparations made for an offensive between the Vallarsa and the Brenta in the middle of September.

The considerations which governed the Italian preparations were resumed by Diaz in a report published in the spring of 1919. "The plan for the offensive, considered by itself, had to aim at assisting the general effort of the Allies to the utmost in accordance with two different and possible solutions; to drive the attack home with all available forces, throwing even the last available man into the scale, in case the possibility presented itself on the fronts of the Entente of obtaining a real superiority of forces and of gaining a decision at one blow; or else to make a preparatory attack as a first phase of a more complex effort, in case the enemy, although already beaten, should succeed in reëstablishing a solid defensive front in all the theatres of war." Diaz did not think that the time was ripe for the more ambitious effort, but he did not lose sight of the possibility which might be afforded by a change in the course of events. He prepared for the attack between the Vallarsa and the Brenta, but at the same time, according to his report, "another and bigger scheme was being silently matured in the interior of the *Comando Supremo*, entrusted to a few men only to be worked out and guarded with the strictest secrecy."

In the meantime a joint Franco-Italian offensive in Albania had caused the Austrians some trouble and compelled them to reënforce their line. They had lost several thousand prisoners, and the Italians had occupied both Berat and Fieri. This occupation was only temporary. When Gen. Pflanzer-Baltin arrived with reënforcements in Aug. the Italian line, which was too far ahead of the French on their right, was withdrawn to the high ground S. of Berat and the Semeni river. Although the Italians had a large force in Albania (nearly 100,000 men), the difficulties of communications and the ravages of malaria made prolonged operations nearly impracticable, but the advance upon Berat served a useful purpose in detaching enemy reserves from a sector where they were badly needed, for the Allied attack against Bulgaria was imminent.

Early in Sept. Diaz went to Paris to discuss the situation. He was still preoccupied in regard to his reserves, and in view of the very large number of American troops now in France he urged that a strong American force should be sent to Italy, not to take part in the offensive planned for the middle of the month, but to act as a reserve in case of need. He pointed out that he was still inferior in numbers to the enemy, and that in spite of great efforts on the part of the munition factories he had no marked superiority in guns. He had to attack an enemy who held very strong positions, and he was without what an Allied committee of experts had agreed were the two essentials to a successful offensive—tanks and *ypérite* gas. He was not satisfied that the *moral* of the enemy troops had fallen so low as to have any marked effect upon their powers of resistance. Several minor actions undertaken with the express object of testing their *moral* had found no lack of combative spirit. The appeal for American reënforcements did not commend itself to the Allies, who thought that the situation demanded the concentration of every available man and gun against the German armies, now very hard-pressed. Diaz was urged to attack with his own forces, and it was pointed out that the desperate internal conditions in the Austro-Hungarian Monarchy must have affected the spirit of the army.

Diaz was not convinced by the arguments addressed to him in Paris, and the denial of American reënforcements, to be on the spot in case of need, was strongly felt at Italian headquarters. Diaz was determined to choose his own time for his attack, and Badoglio was at one with him. Waiting meant an increased supply of guns and shells, apart from other advantages. The situation was summed up in the report already quoted: "The *Comando Supremo* would never have been induced to incur a useless sacrifice of men, but it was ready to take any risks as soon as ever the situation rendered this useful and necessary."

The Italian command was severely criticised for its cautious attitude, in Italy as well as in the Allied countries, and as time went on, leaving the date originally fixed for the Asiago offensive so far behind as to preclude the explanation of a delay due to weather or to the necessity of putting the finishing touches to preparations, criticism in some quarters descended to the level of recrimination. Italy's difficulties and Italy's losses had never at any time been properly realized in England and France, and it was only natural that now, while British and French troops were slowly driving the Germans back and no news came from the Italian front, there should be a revival of the suggestion, so strangely current at various periods of the war, that Italy "was not pulling her weight."

This was ignorant criticism, but the Allied commands also felt strongly that Diaz was now in a position to attack, and the order had already been given to withdraw a portion of the British force in Italy when Diaz disclosed his plan for an early offensive on the grand scale. The general situation had been definitely changed shortly after the Paris visit. In the middle of Sept. the victorious advance from Salonika began, and seemed to offer the chance for the more ambitious scheme which had already been under consideration. The final details of this scheme were quickly worked out, and "on Sept. 25, four days before the conclusion of the Bulgarian armistice, orders were issued for a rapid concentration of troops, artillery, and technical services in the sector chosen for the attack, which was no longer the plateau, but the Middle Piave" (Gen. Diaz's report).

The Italian plan was to concentrate on the river front between Pederobba and Ponte di Piave (E. of Treviso), to cross the river and break through by way of Conegliano to Vittorio Veneto, dividing the Austrian V. and VI. Armies. The general situation rapidly improved, and it was clear that the German request for an armistice on Oct. 4, to which Austria-Hungary subscribed, would further weaken the resisting power of the troops of the monarchy. The attack was fixed for Oct. 16, but bad weather and a rise of the Piave caused a delay which was used to extend the plan of operations. It was decided to open the action with an attack by the IV. Army in the Grappa sector, with the double object of drawing the enemy reserves from the Feltre sector and of breaking through in this direction. The attack on the Piave was to be carried out by three armies, the XII., VIII. and X., of which the first and last had been formed specially for this offensive. The XII. Army, which included a French division, was commanded by Gen. Graziani, the commander of the French troops in Italy; and the X. Army, which included the British XIV. Corps, was commanded by Lord Cavan. The main drive was to be made by the VIII. Army, attacking from below Pederobba to Ponte della Priula. The XII. Army was to advance northward astride the Piave, while the X. Army was to attack the right wing of the Austrian V. Army and form "a defensive flank to cover and protect the principal manœuvre of the VIII. Army" (Gen. Diaz's report). The attacking mass consisted of 22 divisions, of which two were British and one French, while 19 divisions were held in reserve. Against this force the Austrians had 23 divisions in line or immediate reserve, with 10 more divisions within reach. Nearly half the Austro-Hungarian force (30 divisions) lay between the Stelvio and the Brenta, or along the Lower Piave, while in these sectors the Italian forces had been reduced to a total of 16 divisions.

The IV. Army attacked at dawn on Oct. 24, and though some headway was made the enemy put up a very stubborn resistance.

In the early hours of the same day British troops occupied the long shoal island of the Grave di Popodopoli, crossing the main channel and driving back the Austrian outposts. The general offensive should have followed the next night, but a sudden rise in the river counselled delay, and it was not until the night of Oct. 26 that the bridges began to be thrown across the river for the main attack. Next day three bridgeheads were established: opposite Pederobba, N. of the Montello, and opposite the Grave di Popodopoli. The most important advance was made in the latter sector, where the X. Army succeeded in advancing to a depth of over two miles, and took over 5,000 prisoners. North of the Montello the left wing of the VIII. Army gained about a mile, though its bridges were all destroyed during the day, but the right wing of the army was unable to throw its bridges and only a detachment of storm-troops reached the left bank. There was a gap of some six miles between the left wing of the VIII. Army and the British Corps which formed the left wing of the X. Army, and the chief move in the general manœuvre was checked. No better fortune attended the efforts made the following night. The swift current and the enemy guns defied all attempts to establish the bridges, and the engineers suffered very heavy casualties. In spite of the initial successes, the situation was unsatisfactory, but after the first failure to cross the river E. of the Montello Gen. Caviglia, who commanded the VIII. Army and had the general direction of the attack, had detached the XVIII. Corps to cross by the X. Army bridges, push N. and clear the front of the troops who were held up. The move was entirely successful. The XII., VIII. and X. Armies all made good progress, especially the X.; the separation of the Austrian V. and VI. Armies was effected, and on Oct. 29 troops of the VIII. Army reached the town of Vittorio Veneto. By that evening the attacking armies had taken 33,000 prisoners, and the position of the Austrian troops on the Piave front was hopeless. Next day resistance broke down, and the retirement which had already begun became a complete rout. The troops on Monte Grappa had hitherto held firm against the repeated attacks of the IV. Army, losing little ground, but here too, on the night of Oct. 30, a retreat began that was to turn into a flight.

Late on the evening of Oct. 30 the Austrian command announced that in view of the discussions regarding an armistice which were being conducted between Germany and the United States "our troops fighting on Italian soil will evacuate the occupied region." On the same day the order for a general retreat was given, and that evening, in the Val Lagarina, Gen. Weber von Webernau, commander of the VI. Corps, made a formal demand for an armistice. Next day he and his staff were taken to the Villa Giusti near Padua, and discussions were begun. It was, of course, necessary to communicate with Versailles, where the Allied War Council was discussing the question of a reply to Germany's demand for an armistice.

Meanwhile the fighting continued, and the armies of the monarchy crumbled away. The Italian VI. and I. Armies attacked on the Trentino, and the III. Army, which had crossed the Piave two days before, was already taking part in the pursuit of Boroevich's broken divisions. On the night of Nov. 2–3, although the armistice was not yet signed, the Austrian command issued an order for the cessation of hostilities. It was at first revoked by the Emperor Charles, but was reissued and reached the front on the morning of Nov. 3. In point of fact the terms of the armistice were only agreed on verbally on the afternoon of Nov. 3, and signed at 6:30 P.M. Hostilities were to terminate at 3 P.M. on Nov. 4.

The Austrian surrender was complete. The troops of the monarchy were to retire beyond the Treaty of London line, leaving all war material and railway equipments. The army was to be demobilised except for 20 divisions at pre-war peace strength, and the Allies were to have the right to occupy any strategic points in Austria-Hungary which they might deem necessary, and were to have free right of passage and use of Austro-Hungarian means of transport "over all road- and rail-and water-ways in Austro-Hungarian territory."

When hostilities ceased Italian troops were far up the Trentino, in the Upper Adige valley and in the hills to the S.W. of Bozen, while in the main valley they had pushed beyond Trento and reached Salorno. Other troops had advanced far into Cadore, and to the E. the line of the old frontier was passed and the middle waters of the Isonzo were reached. On Nov. 3 Trieste had been occupied from the sea, and half an hour before the expiration of the armistice term an Italian force was landed at Zara in Dalmatia.

When the hour struck for the cessation of hostilities, more than 300,000 prisoners had already been counted by the Italians, and the total figure exceeded half a million. A number of troops who had been cut off were allowed to pass the frontier after being disarmed, but not much more than half of the Austro-Hungarian troops on the Italian front reached the territory of the crumbling empire. All material was left behind, including some 7,000 guns. The defeat was overwhelming.

The Austro-Hungarian armies, in spite of their bad food and growing depression, began by putting up a stout resistance. The troops in the Grappa sector in particular not only resisted firmly but counter-attacked with great vigour, and punished the Italian IV. Army very heavily. The seven divisions of the IV. Army lost over 20,000 men, nearly three-fifths of the total casualty list, which exceeded 35,000. The fighting on the river front was stiff at first, but the defenders were heavily out-gunned (their main artillery concentration was in the Grappa sector), and they were outmanœuvred and outfought by the attacking infantry. They were already soundly beaten when the order to retreat was given, and when that order reached them they threw up the sponge. Some of the reserve units had shown a disinclination to move up to the front, and two brigades had previously been sent to the rear because they could not be trusted. The troops in reserve had been more affected than those in line by the news of the general breakdown in Austria-Hungary, and they had no stomach for what must have seemed to them a useless fight. In the end the leaders too threw up the sponge. They knew, although the troops did not know, the hopelessness of the situation.

It was exactly a year after the great disaster of Caporetto that Italy shattered the armies of Austria-Hungary. Seldom in history has so great a disaster been followed by so complete a triumph. Yet the final overwhelming success of Vittorio Veneto was not Italy's greatest victory. The way to it was paved by greater deeds, the wonderful recovery on the new line after the great retreat, and the successful resistance against the last Austrian offensive that was the first ray of light to break upon those gloomy months when the fortunes of the Allies seemed at their lowest. Nor can the sum of Italian achievements be judged by the issue of those battles which were crowned with victory. Italy's achievement, her contribution to the great effort that led to the final triumph of the Allies, can only be gauged by a review of the campaign as a whole, by a realization of the extent to which she drained the resources of Austria-Hungary, and of the price which she paid. Her dead totalled 564,000 (a revision promised to increase this figure); her wounded exceeded 900,000; 570,000 men were permanently disabled for military service by wounds or disease. The proportion of dead to population (in 1915) was over 1·5%, nearly as great as the proportion suffered by the United Kingdom, and greater than the percentage of dead among the white population of the British Empire. For the first two and a half years of the war the Italian armies were fighting almost entirely in enemy territory, threatening the Austrians in a vital spot and keeping employed a number of enemy divisions that increased from 20 to 40 (in the summer of 1917). During the last three months of 1917 the number of enemy divisions rose to 55, and in 1918 practically the whole effective strength of Austria-Hungary was arrayed against Italy, the number of divisions at one time approaching 70.

The figures speak plainly, and Ludendorff, in an interview published in the spring of 1919, gave Italy her due in placing among the chief causes of the German defeat "the lack of sup-

port from Austria, gripped ever more tightly at the throat by Italy." Cadorna rightly claims that Italy's "grip on Austria's throat from 1915, compelling her to immobilize against us ever-increasing forces, constituted the most notable result of our war, although it was little apparent to the eyes of civilians. It contributed largely to the victory of the Allied arms and to our final triumph." (W. K. McC.)

**ITALIAN LITERATURE** (*see* 14.897).—In the decade after 1910 the best Italian writers had given up that exaggerated imitation of D'Annunzio which had prevailed at the opening of the century. Among the poets Giovanni Pascoli, Giovanni Bertacchi, Francesco Pastonchi and Ada Negri continued to produce actively. Pascoli was the most prolific, with his *Canzoni di Re Enzio*, *Il Paradiso*, *Il Carroccio*, the *Inni* to Rome and Turin, and the *Poemi italici;* Bertacchi published the *Canzonieri delle Alpi* and *A fior di silenzio;* Pastonchi *Il Randagio;* and Ada Negri some more lyrics, of which the most remarkable are *Dal profondo* and *Il libro di Mara.* G. A. Cesareo, best known as a literary critic, published a volume of verse entitled *I canti di Pan.* Among the younger poets Sem Benelli, chiefly a dramatic author and an active politician, published a fine poem entitled *L'altare;* Guido Cozzano a volume of lyrics *I colloqui;* Giovanni Castanzi *Luce lontana;* and Francesco Gaeta *Poesie d'amore.* The most prolific of the dialect poets was "Trilussa" (Salustri), who has written a number of clever satirical poems in the Roman dialect. An author of excellent Latin verses who came to the fore was Francesco Sofia Alessio, with his volume *Musa latina*, which also includes an Italian translation.

Among the novelists D'Annunzio brought out a strange tale in three volumes entitled *La Leda senza cigno*, and *Forse che sì, forse che no*, a long novel in which aviation plays an important part. Grazia Deledda continued her output of Sardinian stories, all more or less in the same grey pessimistic key—*La colpa altrui*, *Marianna Sirca*, *La madre.* Luigi Pirandello, one of the most prolific of Italian novelists, was in 1921 perhaps the best living Italian humorist; the most important of his recent novels are *Si gira*, *Suo marito*, *I vecchi e i giovani* (a political novel), *Terzetti.* Dora Melegari, essayist and literary critic, who writes in French as well as in Italian, has published a novel with a background of Risorgimento history, *La città del giglio.* Matilde Serao was still active, with her novels *Sicilia mattutina*, *Addio amore*, *Ella non rispose* and *Preghiera.* Cesare Pascarella, the well-known Roman dialect poet, produced a novel, *Le memorie d'uno smemorato.* Luciano Zuccoli, another very active young writer, published numerous novels, among which may be mentioned *La freccia nel fianco*, perhaps his best, depicting the development of a boy's soul from early youth to manhood; *Farfui*, *La divina fanciulla.* Giulio Bechi, a regular officer who was killed in the World War, wrote a novel, *I seminatori.* The Anglo-Italian writer, Annie Vivanti (Mrs. John Chartres), published two novels, *I divoratori* (about the war) and *Naja tripudians.* Alfredo Panzini, a young writer of originality, produced *La madonna di Mamà*, a war novel; *Santippe*, a half-classical, half-modern novel; and *Il mondo è rotondo.* Another very young writer is Rosso di San Secondo, author of *La fuga* and *La festa delle rose.* Perhaps the "best seller" in 1921 was Guido da Verona, whose novels, *La vita comincia domani*, *Colei che non si deve amare*, *Sciogli la treccia Maria Maddalena*, etc., combine a good deal of rather cheap philosophy with amorous adventures; his *Mimì Bluette, fiore del mio giardino* is written partly in French. Of Virgilio Brocchi's many novels, *Il labirinto*, *Milì*, *Secondo il cuor mio*, *Il posto nel mondo*, may be mentioned, as well as several volumes of short stories. G. A. Borgese, professor of German literature and well known as a journalist and critic, tried his hand at fiction with *Rubè*, a novel of the post-war period and spirit. Among Mario Mariani's stories, *I colloqui colla morte*, impressions of the war and life in the trenches, is particularly striking. Francesco Sapori also wrote a war novel, *La trincea.* Guido Milanesi wrote some good sea stories, such as *La voce del fondo*, dealing with life on a submarine. Marino Moretti, Raffaele Calzini and Massimo Bontempelli are all prolific short-story writers, while the last-named is further known for his essays on the Greek classics. Ugo Ojetti, who is more generally known as an art critic, has also written a number of witty and satirical but somewhat bitter short stories.

The Italian stage is still too much under the predominance of foreign and especially of French influence to offer much attraction for first-rate native talent. D'Annunzio has, however, written much for the stage, and during the decade he produced his picturesque Venetian-Byzantine poetical drama, *La nave; Fedra*, a classical reconstruction; the mystery play, *Il mistero di San Sebastiano*, originally written in French; and *La Pisanella*, a vivid presentment of the mediaeval Levant, also written in French. His *Il ferro* is a drama of modern life with a plot reminiscent of *Hamlet.* Sem Benelli, already mentioned as a poet, has achieved considerable success with his historical plays, *La maschera di Bruto*, *Il mantellaccio*, and, above all, *La cena delle beffe; L'amore dei tre re* was less successful. Domenico Tumiati has written some plays on the Risorgimento—*Giovine Italia* and *Il Tessitore*, the latter with Cavour for its hero. The novelist Luigi Pirandello is also a dramatic author (*Pensaci Giacomino*, *Il giuoco delle parti*, *Il berretto a sonagli*). Alfredo Testoni, Fausto M. Martini, Dario Niccodemi have all written for the stage with some success. Among the most popular dialect plays should be mentioned those of Salvatore di Giacomo in the Neapolitan vernacular (he has also written a good deal of dialect poetry) and Nino Martoglio in that of Sicily.

The "futurists" continued their strange vagaries, and a small number gave proof of some real literary quality, but they showed signs of ceasing in consequence to be pure futurists and tending to become more normal. This is particularly the case with Marinetti, generally recognized as the leader of the movement, who was better appreciated as he became less futurist.

Diego Angeli produced an excellent translation of Shakespeare's plays into Italian verse; while Adolfo de Bosis's translations of Shelley and Homer reach a very high level.

The war gave rise to considerable literary but especially journalistic output in Italy. A large number of writers published articles, essays, and books on the various political and economic problems, especially those concerning Italy's rights and aspirations. Among the names appearing most frequently in the press and in the booksellers' windows are those of Virginio Gayda, author of valuable writings on Austria and Russia; the economist Prof. Antonio de Viti de Marco; Giuseppe Prezzolini; Giovanni Preziosi, the ardent Nationalist and editor of the monthly *La vita italiana;* Giuseppe Bruccoleri; Attilio Tamaro, a specialist on Adriatic questions; Umberto Zanotti-Bianco; the Nationalists Ezio Maria Gray, Francesco Coppola, Cantalupo, Leonardo Vitetti, the late Gualtiero Castellini, and the embittered anti-Nationalist historian Gaetano Salvemini.

The most eminent of the purely military writers is undoubtedly Gen. Cadorna, whose important work *La guerra alla fronte italiana*, in spite of its somewhat polemical character, is a most valuable contribution to the history of the war, and also a piece of real literature. Gen. Capello's books, *Note di guerra* and *Per la verità*, are also useful, while Col. Angelo Gatti's essays on various aspects of the war contain admirable criticism.

A curious book which does not come into any of the above categories is Giovanni Papini's *Vita di Cristo*, a paraphrase of the Gospels by an erstwhile freethinker turned mystic.

Perhaps the most distinguished living stylist in Italy in 1921 was Emilio Bodrero, professor of philosophy at the university of Padua and author of numerous literary and aesthetic essays, articles, reviews, as well as of some purely philosophical works of high scientific value. His literary activities were interrupted by the war, in which he distinguished himself for conspicuous gallantry in the field, but he subsequently resumed them as well as his lectures at the university. (G. B.*)

**ITALO-TURKISH WAR, 1911–12.**—Following upon the discussions which took place between Rome and Constantinople during the summer of 1911, an ultimatum from Italy was delivered to the Porte on Sept. 28, demanding Turkey's consent to a military occupation of Tripolitana and Cyrenaica. A period of 24 hours was set by the ultimatum, and as the Turk-

ish reply did not meet the Italian demands a state of war was declared as from 2.30 P.M. on Sept. 29.

Military action was slow to succeed the formal declaration of war: the political situation had developed so rapidly that the diplomats had far outrun the soldiers. On Sept. 3 at the close of the Italian grand manœuvres, the 1889 class of conscripts had been dismissed, leaving only the 1890 class with the colours. On Sept. 23 the 1888 class was called up, and two days later secret mobilization orders were issued. It was no doubt in the belief that Turkey would yield to pressure that the ultimatum was presented more than a week before an expeditionary force could be dispatched from Italy. In the interval the Italian navy had to act alone, at first by demonstration and later in earnest.

On Sept. 28 an Italian squadron appeared off Tripoli, and the following morning an officer landed and informed the acting Vali that if a satisfactory answer were not received from the Porte that afternoon a state of war would begin. Next day, the news of Turkey's refusal having arrived, the blockade of Tripoli was declared, and the Turkish authorities were notified that if the town were not surrendered in three days it would be bombarded. Most of the Italian subjects resident in Tripoli had already left and those who remained were taken off on the morning of Sept. 30. Next day the cable between Tripoli and Malta was cut.

Meanwhile hostilities had begun elsewhere. On Sept. 29 and 30 Italian destroyers, under the command of the Duke of the Abruzzi, sank two Turkish torpedo boats off Prevesa, on the coast of Epirus, and on Oct. 1 Admi. Aubry left Augusta to go in search of the Turkish fleet, which the declaration of war had found at Beirut. He had with him the two battleships "Roma" and "Vittorio Emanuele" and the torpedo cruiser "Agordat," and on the way he was to pick up the battleship "Napoli," which was in the narrow seas between Sicily and Tripoli, and the two cruisers "Amalfi" and "Pisa," which had been sent to Derna, in Cyrenaica, to destroy the wireless station there. But the orders given to Admi. Aubry were suddenly countermanded. Instead of steaming for the Aegean in order to intercept the Turks, he was sent to Tobruk, which was occupied by a detachment of sailors on Oct. 4. Tobruk, which had been much discussed as a potential naval base, was thus the first point on the long coastline of Turkish N. Africa to be occupied by the Italians. The first detachment of the expeditionary force, moreover, which left Naples on the evening of Oct. 5, was sent to Tobruk instead of to Tripoli.

The renunciation of the attempt to cut off the Turkish fleet was a political move. The Italian Government believed that the Porte would soon realize that it was impossible to defend the Tripolitan provinces, and would be willing to enter into some arrangement which would satisfy Italian aspirations and save the face of Turkey. In these circumstances there was a natural disinclination to embitter relations by the destruction of the Turkish fleet. Another reason was the desire to localize the conflict, if a real conflict had to come. Italy was well aware that in declaring war against Turkey she ran the risk of stirring up further trouble, and if hostile operations could be confined to the African coast, the danger of other complications would certainly be lessened.

On Oct. 2 Admi. Thaon de Revel, who commanded the Italian cruiser squadron, landed in Tripoli under a white flag and again demanded the surrender of the town. The Turkish authorities, after a good deal of discussion, declined, and next day the Italian fleet bombarded the obsolete fortifications for about two hours. There was a mere show of resistance. The bulk of the Turkish garrison had already begun to leave Tripoli, and by the next day, in pursuance of the last orders received from Constantinople, all the troops had retired into the sandy plains. At noon the German consul reported the evacuation of the town. He stated that the Arabs had begun to pillage, and asked that troops should be landed at once. Next day a force of 1,600 sailors was disembarked, and two days later Admi. Borea-Ricci assumed the governorship of the town and received the submission of about a hundred sheikhs and other men of position, among them Hasuna Pasha Karamanli, lineal representative of the family which had ruled Tripoli prior to the Turkish occupation, and mayor under the Turkish régime. A week elapsed between the landing of the sailors and the arrival of the expeditionary force, and during this time the sailors, besides patrolling the town, had to hold a defensive line some 8 m. in length. If the Turks had chosen to attack, they could almost certainly have retaken Tripoli. But they made better use of the time allowed them. When the Turkish garrison retired from the town and the Italian sailors landed, the majority of the Tripolitan chiefs were ready to make submission. They had no love for the Turk, and little objection to a new overlord. Two men turned the scale in favour of resistance by supporting the efforts of Nesbat Bey, the Turkish commander in Tripoli—Ferhat Bey, deputy for Tripoli, and Suleiman el Baruni, a Berber from Fessato, who was deputy for the Jebel region. Each was possessed of great influence in his own district, and was able, first, to prevent the submission of the tribesmen, and, as time went on, to bring native levies to support the Turkish regular troops.

The first Italian transports appeared off Tripoli at dawn on Oct. 11, and the disembarkation at once began. But bad weather made it difficult to land guns, stores and transport, and it was not until Oct. 20 that all the equipment had been put on shore. The expeditionary force consisted of some 9,000 rifles with a few field and mountain batteries and two squadrons of cavalry, but this force had only a very limited radius of action owing to lack of transport. The conviction that the Turks would not receive support from the native tribesmen, and consequently, would never retreat toward the interior, had limited the transport organization to what was necessary for a two days' march. General Caneva, who was in command of the troops in the two provinces and had assumed the governorship of Tripoli, was practically tied to his base. He was faced by an unexpected situation, caused by the retreat of the Turks, but all his information was to the effect that the Italian occupation would be welcome to the Arabs and Berbers. He believed that he could deal with the Turks at his leisure. He had not yet realised that the Turkish garrison was now a nucleus round which a formidable resistance was being built up, and that already a reaction against the invader was imminent.

Meanwhile Derna, Homs and Bengazi (Benghazi) had been occupied. At Derna and Homs the Turkish garrisons retired southward after a short bombardment. At Bengazi the Italian landing was opposed, and the town was only occupied after a long day's fighting, the Italians, who had disembarked to the south of the little port, losing over 100 men. There was no further fighting in the Bengazi district for a considerable time, but both at Derna and Homs there were sharp encounters during the first few days after the landing of the troops.

The blow against the Italians in Tripoli came unexpectedly. During the early days of the occupation the belief that the Arabs would never make common cause with the Turks led to an overconfidence and lack of vigilance. There was little apprehension of an attack now that the Italian troops were in great superiority over the Turks, and the conviction that the Arabs were friendly led to no hindrance being placed upon communications between the town and the surrounding country. Arabs, and supposed Arabs, came and went freely. It was due to over-confidence also that the disarmament of the natives was not pursued with vigour or system until it was too late. In this way it was possible for the Turks, and those Arabs who were opposed to the coming of the Italians, to arrange for a rising behind the lines which should coincide with an attack.

To the west and south the Italian lines faced the open, rolling plain, but on the east, for a distance of two miles, they ran through the wide strip of palm groves and fruit gardens that stretches eastward from the town for nearly a dozen miles. Against this part of the line the Turks and Arabs, favoured by the thick vegetation, attacked suddenly on the morning of Oct. 23, simultaneous demonstrations being made on the south and west. The attack upon the regiment of Bersaglieri who held the long line in the oasis was carried out with decision and was aided by a simultaneous attack from a number of natives within the lines. On the left, by the village of Shara Shat, two companies were overwhelmed and cut to pieces, and the rest of the regiment was hard put to it to hold its own. Supporting troops were sent up from the town, but they had to fight their way through the network of gardens, sniped by those of the local Arabs who had joined in the fight, and the much greater number who had come through the gap made by the destruction of the two companies at Shara Shat. The fighting lasted all day, but in the evening the assailants were finally driven off.

There was much excitement in the town during the morning, and a few Italian soldiers were killed, one of them by a *kavass* of the German Consulate. The streets were rapidly cleared, and there was a good deal of firing by the troops, mostly in the air. A few Arabs were shot out of hand, and the *kavass* above mentioned was executed after a summary trial. In the oasis, not only to the east of the town, but behind the southern lines, sniping went on all day, and the order was given that the oasis within the Italian lines should be cleared of its inhabitants, and that those found in arms against the Italians should be shot. The oasis was cleared during the next few days, and several thousand Arabs were brought into the town. There was a good deal of sniping, especially at first, and those who were found in possession of arms were either shot or brought into Tripoli under guard. Undoubtedly, innocent persons were killed during these days, but they were not very many, and most of them were shot by mistake in the confused bush fighting that succeeded the first inrush at Shara Shat. In all, according to the figures furnished by the Arab authorities, a little over 400 inhabitants of the oasis lost their lives. There were some cases of excess on the part of the Italian troops. Careful subsequent investigation showed that they were very few.

The European press, and especially that of England and Germany, was filled with messages which multiplied the number of Arabs killed by ten, and assumed that they were practically all unarmed and harmless peasants. It has since realized that these had been gross exaggeration, and European opinion changed, but the fact that the repression had been severe, and that some innocent persons had been killed, was exploited to the utmost by the Turks in Tripoli and their supporters. Many men of the Tripoli district fought against Italy for a year in the mistaken belief that their families had been massacred.

The attack of Oct. 23 was followed three days later by another. The Turks and Arabs who attacked in the eastern oasis were beaten off after some hours' fighting, but south of the town the line was rushed by a large body of Arabs who penetrated into the gardens and were dislodged with difficulty by the reserves. For a short time the situation was anxious, but after about five hours' fighting the attacking tribesmen were driven off, leaving many dead. This fight showed that the line occupied was too long for the number of troops available, and it was reduced in extent by a considerable withdrawal in the eastern oasis. This withdrawal was made the subject of alarmist rumours in the European press and many thought that Tripoli would shortly be retaken; and the United States cruiser "Chester" was sent with orders to embark the American consul and any other American subjects. The consul declined to go, and his action was of value in indicating the true situation. No doubt, in addition to frightening Europe, the withdrawal encouraged the Turks and Arabs, who appeared to be in the position of besieging Tripoli. For a month the town did give the impression of being beleaguered; in reality, during this period, Gen. Caneva's chief enemy was cholera. The disease broke out towards the end of Oct. and for some weeks it caused much loss and still more anxiety. In all, nearly a thousand soldiers died of cholera, and the native population suffered heavily. The problem of tackling the epidemic was rendered more difficult by the large number of "immigrants" from the oasis, who had sought refuge in the town in the early days of the occupation, or had been brought in when the oasis was cleared. Prompt and effective measures were taken, but it was not until the middle of Nov. that the authorities could breathe freely, and for some weeks the situation required vigilance.

From the events of Oct. 23 and the following days it was clear that the calculations of the Italian Government had been at fault. Turkey was not prepared to lose the Tripolitan provinces without a struggle, and the local tribesmen were joining in the resistance of the garrison. Reinforcements were immediately dispatched to Tripoli, and on Nov. 5 a decree was published in Rome, annexing the two Turkish provinces. Italy was no longer inclined to consider a compromise, and the annexation was proclaimed in order to stop all efforts in that direction and define her intentions, not only to Turkey, but to the European Powers. Further reinforcements followed, and by the fourth week in Nov. Gen. Caneva had under his command 34 battalions of infantry (nearly 25,000 rifles) and 16 batteries of field and mountain artillery. On Nov. 26 an advance was made through the oasis on the east and the old lines were occupied after stiff fighting. Eight days after, on Dec. 4, a force of 12,000 men, with five mountain batteries and two squadrons, supported from the trenches by field guns and a few heavy guns which had arrived some days earlier, advanced into the plain against the main body of the enemy, which was based upon the little oasis of 'Ain Zara. It was hoped that the Turks would stand, but this was not their policy. They fought a stubborn containing action, and lost the few guns they possessed, but they retreated in good time, leaving to the quick-moving tribesmen the task of delaying the Italian advance. 'Ain Zara was occupied in force by the Italians, and Turkish headquarters were established at 'Aziziya, some 30 m. south of Tripoli, while a strong force, mainly Arab, was encamped at Suani Beni Adham, a day's march from the town. The eastern oasis was deserted by the Arabs, and its farthest point, Tajura, was occupied by the Italians on Dec. 13.

At the beginning of Nov. the Italian Government had considered the possibility of extending the theatre of war, by sea at least, in the hope of inducing Turkey to give up the struggle. Austria-Hungary intervened, backed by Germany, and on receipt of a report of Italian activity off Salonika, Count Aehrenthal told the Italian ambassador in Vienna that Italian action "on the Ottoman coasts of European Turkey or in the Aegean Islands could not be allowed either by Austria or by Germany, as it would be contrary to the Treaty of Alliance." He said further that he considered "the bombardment of ports in European Turkey such as Salonika, Kavalla, etc., as contrary to Article VII." (of the Alliance). Italy's action being limited in this way, it was necessary to solve the Tripoli problem directly, but the task was more difficult than it need have been owing to other limitations laid upon the military authorities by the Italian Government. Gen. Caneva's orders appear to have been that he must not risk reverses or suffer heavy loss. In the circumstances a desert expedition in pursuit of the Turks and their mobile auxiliaries seemed hardly practical. In any event, the four months following the battle of 'Ain Zara passed without any action of importance in Tripolitana. A flying column sent southwards from 'Ain Zara on Dec. 1919 had a stiff fight near Bir Tubras. The oasis of Gargaresh, 2 m. west of Tripoli, was occupied on Jan. 20, after a skirmish with a body of Arabs who came up from the south when the Italians advanced into the open. Five weeks later the situation at Homs was improved by the capture and retention against counter-attack of the Mergheb, a hill which dominates the little town. No other fighting took place in the western province until the spring was nearly over, though in Feb. the arrival of camels, motor lorries and Eritrean askaris seemed to point to an early advance.

During the period of inaction the relations between Italy and France came under a cloud. On Jan. 15 and 18, respectively, the French mail steamers "Carthage" and "Manouba," *en route* from Marseilles to Tunis, were stopped and brought into Cagliari by Italian cruisers. The grounds given were that the "Carthage" was carrying an aeroplane destined for the Turks, and that a Red Crescent Mission which was on board the "Manouba" included several Turkish officers. The French Prime Minister, M. Poincaré, made a speech that was exceedingly sharp in tone, and the press of both countries heaped fuel on the flames kindled by the incident. The matter was referred to The Hague, where the verdict was given in favour of Italy, but M. Poincaré's speech and the threats of the French press were not forgotten by Italian public opinion.

In Cyrenaica progress had been no more speedy than in the region of Tripoli. No effort, in fact, had been made to advance towards the interior, or even to extend the area of occupation round Bengazi, Derna and Tobruk. Nothing, certainly, was to be gained by an advance into the blank desert behind Tobruk, and it was decided to make no move from Bengazi and Derna. Enver Bey succeeded in reaching Cyrenaica early in the winter, and by his energy and personality he succeeded in organizing a formidable resistance, securing a unity among the tribesmen, and a willingness to coöperate with the Turks, which had never before existed. Under Enver's direction both Bengazi and Derna, but especially the latter, were closely beset throughout the winter. The Derna lines, which were dominated from the hilly ground immediately behind the town, were harassed frequently, and between the end of Dec. and the first week in March four important attacks were delivered at intervals of about three weeks. All these attacks were repulsed after hard fighting, and the result of the engagement of March 3, in which the attack was directed by Enver Bey in person, seemed to convince the Turks and Arabs that their attempts were useless. The neighbourhood of Derna remained quiet for nearly five months. At Bengazi, except for one reconnaissance in force at the end of Nov. when an Italian column went out some 6 m. from the town and returned after a sharp fight; there was no action of any importance till March. Blockhouses were built to secure the Italian lines, and these were occasionally attacked, but the Italians made no movement until March 12, when Gen. Briccola, who commanded the garrison, sent out a column to attack a large body of Arabs who had occupied an oasis, or rather a collection of gardens, known as the Two Palms, less than half-a-mile from one of the Italian redoubts. A mixed force of Turks and Arabs also approached the town from the south-east, but did not press home their attack. The Arabs in the oasis stood firm, but they were overwhelmed by the Italian attack and suffered very heavily.

After the battle of the Two Palms there was practically no fighting in the Bengasi district, but in April the long spell of inaction in the western province came to an end, and from that time onward the resistance of the Turks and Arabs was gradually broken by a series of operations at various points. On April 10 and 11 a landing was effected, without opposition, at Ras Makabes, a headland not far from the Tunis border, and a base was established near the old fort of Bu Kamesh. The Italian force consisted of two brigades, one from Tripoli and one from Italy, under the command of Gen. Garioni, and it made short work of a few minor attacks delivered by the Arabs. A landing on this part of the coast would have been effected earlier if it had not been for the difficulty of keeping up supplies during the winter.[1]

In April Italian warships appeared off the entrance to the Dardanelles. They were fired on by the Turkish forts, and their answer to this fire drew a fresh and very energetic protest from Vienna. The Italian ambassador was informed that if Italy "wished to resume her freedom of action" Austria could do the same. Any further action on similar lines "might have grave consequences." After a daring exploit by Capt. Millo, who penetrated the Dardanelles in a small destroyer, the northern Aegean was left alone by the Italians, but in May the island of Rhodes and 12 small islands of the Sporades were occupied by Italy. Only in Rhodes was there any resistance, but the Italian force under Gen. Ameglio, which was formed in the main of troops from Tripoli and Bengazi, fought a brilliant little action at Psithos and captured some 2,000 Turkish regulars.

On May 2 Gen. Reisoli pushed back the Arabs some distance to the east of Homs, inflicting considerable loss, and five weeks later the Tripoli district once more became the scene of fighting. Encouraged by the long period of quiet the Turks and Arabs had come nearer the town, and a considerable force was entrenched near the oasis of Zanzur, a few miles west of Gargaresh. On June 8 two Italian brigades drove the enemy out of their positions, while a reserve brigade nearer Tripoli awaited the expected arrival of enemy reinforcements. The Arabs came up in strength, but were soundly beaten, losing nearly 1,000 killed, while the Italians had over 300 casualties. A few days later the Arabs attacked the Italian positions near Homs, but were driven off with heavy loss (about 700 killed). They were taken in flank by a battalion of Bersaglieri, and after this repulse Homs was undisturbed by any further fighting. On June 15 an Italian force under Gen. Camerana landed near Misurata, and occupied the town some days later, and on June 27 Gen. Garioni started a series of operations from Bu Kamesh, which ended, after various successful actions, in the occupation of Zuara

[1] Transports actually left Italy for Zuara (Zoara) in Dec. but returned after being a month at sea in persistent bad weather.

and an advance towards the oases of Regdaline, from which the Arabs were driven on Aug. 16.

Peace negotiations were already being conducted at Lausanne but progress was very slow, and two important actions were fought before a conclusion was reached. On Sept. 2 Gen. Caneva was recalled to Italy, and the command of the troops in Libya was divided, Gen. Ragni becoming governor and commander-in-chief in Tripoli, and Gen. Briccola, who had hitherto been subordinate to Gen. Caneva, being given independent authority in Cyrenaica. Gen. Briccola's first action was to improve the position at Derna, which had been a daily target for a few Turkish shells for more than eight weeks. The Derna garrison had been weakened in order to provide troops for the Rhodes and Misurata expeditions, but early in Sept. detachments were sent from Bengazi, Homs, Zuara and Rhodes, and on the 14th three columns moved out from the lines, and occupied new positions on the high ground to the south. Three days later the Turks and Arabs attacked in force, but though they fought with the most reckless bravery they met with a very severe defeat, and lost some 1,500 men in killed alone. A week later a further Italian advance, both south and east, met with little resistance, and a number of unwounded prisoners were taken.

Meanwhile one more blow had been struck near Tripoli. Large numbers of Arabs had concentrated on the far side of Zanzur, and at dawn on Sept. 20 the Italians attacked. The battle, known as Sidi Bilal, followed the same course as that of the Zanzur battle on June 8, large numbers of Arabs and Turks coming up from the south, and the result was the same. The Arabs fought with great determination, and with greater skill than they had shown before, but their bravery was useless. The Turks and Arabs between them lost over 1,500 killed, while the Italian casualty list was nearly 600.

The Arabs of the plains were now convinced that further resistance was useless, and the Italian advance in preparation would probably have met with little opposition. But peace was imminent. The Treaty of Ouchy was signed on Oct. 15.

The conduct of the Tripoli campaign, as the narrative of events alone would indicate, was prejudiced, first, by the failure of the Italian Government to judge the situation correctly, and, secondly, by the limitations which were laid upon the military authorities. When it became evident that the original plan of campaign, which provided more for demonstration than for action, had failed, the Government were slow to admit the necessity for a change of policy. It was not possible at once to launch a desert expedition, and the difficulties of an advance to the Jebel, through country largely waterless, may be said to have justified the adoption of a less ambitious plan. What is difficult to understand is the practical veto upon action of any kind, which immobilized large forces in Tripoli from Dec. till April, and delayed the carrying-out of the policy which eventually put an end to hostilities, the policy of extending the area of operations and striking a blow whenever the chance offered. It was after long hesitation that the bulk of the native tribesmen joined those who had thrown in their lot with the Turk in the early days of the war. The Arab forces in the Tripolitan plains quadrupled between Dec. and March, the numbers increasing from 5,000 or 6,000 to over 20,000, and the cause of the increase was Italian inaction during that period. The operations of the summer changed the views of the Arabs, but Italian prestige was not wholly restored by the later successes. The policy of the Government bore heavily upon the army, which was the subject of much unfair criticism, and increased the difficulties of those who undertook the administration of the country after the peace. The troubles which were to come with the outbreak of the World War may be traced in part at least to the hesitations and uncertainties of the six months following the first landing. (W. K. McC.)

**ITALY** (*see* 15.1*)[1].—The area of Italy in 1921 was 110,664 sq. m., to which 3,550 had been added for the new territories. In 1919 the pop. was estimated by the statistical department at 36,099,657, or slightly lower than in 1914 (36,120,118.) This does not, however, take into account the very large number of temporary emigrants who returned on the outbreak of the World War, few of whom remigrated since; some 600,000 should therefore be added to the total. It was estimated that the census on Dec. 1 1921 would show a total pop. (including the newly annexed provinces) of about four millions more than at the census of 1911 (34,686,683). The figures for the new territories are: Trentino and Alto Adige 632,380; Trieste 335,500; Gorizia-Gradisca 326,674; Istria 372,117; Zara 18,930. In 1916 the pop. had been 36,346,400. While the immense majority of the pop. are of Italian race and language there are in the old provinces (1911) 87,350 Albanians (Calabria, Puglie and Sicily), 85,960 French in the Val d'Aosta, 9,960 Germans in the same valley and in the Veneto, 40,080 Slavs in the district of Cividale and a few in the Abruzzi and Molise, 30,290 Greeks in the South, and 11,740 Catalans in Sardinia. The pop. of the new provinces comprises 215,345 Germans in the Alto Adige, 13,920 in the Trentino and a few at Tarvis, 326,715 Slovenes, and 141,663 Croats in Eastern Istria. The non-Italian-speaking peoples in the territories annexed after the war represent a far smaller percentage than that of any other victorious nation on the Continent. The religion of the overwhelming majority is Roman Catholicism; there are 123,253 Protestants, 34,324 Jews, and 874,532 declaring themselves to be without religion.

Marriages, which in 1914 were 7·08 per 1,000 inhabitants, fell to 2·72 in 1917, rose to 3·03 in 1918, and to 8·82 in 1919. Births for the same years were: 31·07, 19·45, 17·91 and 21·19, and deaths 17·94, 19·20, 32·29 and 19·01. These figures do not include deaths due to the war. The heavy rise in the mortality in 1918 was due to the influenza epidemic.

The pop. of the chief cities is as follows (1915):—Naples 697,917, Milan 663,059, Rome 590,960, Turin 451,994, Palermo 345,891, Genoa 300,139, Florence 242,147, Catania 217,389, Bologna 189,770, Venice 168,038, Messina (1911) 126,557, Bari 109,218, Leghorn 108,585, Padua 105,135, Ferrara 102,550, Brescia 89,622, Verona 86,448.

During the period 1909–13 the average number of emigrants was about 650,000 per annum, to France, Germany, Austria, Switzerland, Tunisia, and other European and N. African countries (temporary emigrants), and to the United States, Canada, Argentina, Brazil and other parts of America (partly temporary and partly permanent). About 500,000 emigrants returned to Italy each year, and the average excess of emigrants over immigrants in 10 years amounted to 1,500,000. The high birth-rate prevented the population from decreasing, in spite of this heavy drain. In 1914 there were about 6,000,000 Italians residing in foreign countries (2,400,000 in the United States, 1,500,000 in Brazil, 1,000,000 in Argentina, 450,000 in France, 220,000 in Switzerland, 150,000 in Tunisia, Algeria and Morocco, and 120,000 in Germany). The outbreak of the World War, if it did not absolutely put an end to emigration, greatly reduced it; in 1913, 873,000 persons emigrated, in 1914 the number fell to 479,000, in 1915 to 146,000, in 1918 to 28,000. As soon as the war was over emigration rose again, and in 1919 it was 230,000, in 1920 364,944. More than half of these emigrated to America, and about 150,900 to European countries (of whom 72% went to France, chiefly for reconstruction work, 14% to Switzerland and only 3% to Germany and Austria). In the first quarter of 1921 81,000 persons emigrated, of whom 71,000 went to America. In 1919 90,000 emigrants returned to Italy. Emigration was in 1921 still restrained by the high wages in Italy, legal restrictions against immigration in the United States and some other countries, the generally unfavourable conditions of trade almost everywhere, and to some extent by the temporary insufficiency of shipping accommodation. It was estimated that before the war emigrants sent or brought home some 500,000,000 lire a year.

*Government.*—The only important change in the form of Government is the electoral law of 1919, whereby the 508 single-member constituencies were abolished and replaced by 54 constituencies returning 5 to 20 members each, elected by *scrutin de liste* (each voter votes for one or other of the party lists *en bloc*, but he can add preference votes to any three names within his own list). At the elections of May 1921 the number of constituencies in the old provinces was reduced to 40 somewhat larger ones, returning the same 508 members, while six new ones were added for the Trentino, the Alto Adige, Trieste, Istria, Gorisia and Zara, returning in all 27 members, thus bringing the total number of deputies to 535.

*Labour.*—The war and the epidemics which followed it caused the death or disablement of some 1,250,000 men; even if the normal death-rate for the war period (120,000) and the normal number of men disabled through illness or accident (30,000) be deducted, the war losses above the normal still are over a million. These were, however, made good by the return of large numbers of emigrants and the almost complete suspension of new emigration. On the other hand, the war undoubtedly reduced the capacity and above all the will to work in a large number of men, at least temporarily, although many unskilled workers learned new skilled trades while in the army. The great mass of the working classes after the war felt a positive distaste for work, and demanded ever higher wages quite out of proportion even to the increased cost of living, and ever shorter hours. The strike movement assumed an extent and intensity never before dreamed of, and workmen "downed tools" continually. In 1920 no fewer than 1,781,239 workmen went on strike, with a loss of 21,630,200 working days.

The trade crisis, which began to be felt in the autumn of 1920 and became more extensive early in 1921, had a salutary effect however, on labour, and the workmen began to realize that unlimited strikes did not bring increased prosperity. In April 1921 it was estimated that there were about 345,000 unemployed, besides 300,000

[1] Much of the statistical information in this article is drawn from Prof. Giorgio Mortara's *Prospetti economici*. Other figures have been obtained from Government publications.

** These figures indicate the volume and page number of the previous article.*

men working on short hours. Unemployment was greatest in the metallurgical and mechanical industries.

*Cost of living.*—The rise in prices after the war was very considerable. Taking the average prices of the various goods in 1901–5 at 100, the increases were as follows:—

| | Cereals | Other food-stuffs | Textiles | Minerals | General |
|---|---|---|---|---|---|
| Aug. 1914 | 114 | 127·2 | 116·9 | 111·6 | 115·6 |
| Jan. 1918 | 326 | 264·3 | 513·8 | 869·4 | 457·6 |
| " 1919 | 370·8 | 438·7 | 398·4 | 357·3 | 410·1 |
| " 1920 | 436·5 | 578·1 | 937·4 | 811·9 | 634·7 |

The increased inflation of the paper currency was one of the chief causes of the rise of prices, while the rise itself led to further inflation to meet the increased expenses of the Government. Wages on the whole increased to a greater extent than prices, and in many trades the workmen were paid seven to ten times what they were before the war. But the result was that certain trades, such as building, suffered severely and were indeed almost suspended long before the general trade slump, so that those categories of workmen remained unemployed most of the year, unless they changed their occupation, and thus derived no benefit from the general increase. Professional men were able to increase their earnings in proportion to the rise in prices, and the shop-keeping class sold dearer what they had bought dearer, so that they were not hard hit. People with fixed incomes, on the other hand, found themselves several times poorer, but this had the effect of stimulating many *rentiers* to seek occupation and go into business to make good the deficit in their budgets. Pensioners and persons incapable of earning were the worst off. Government officials received various increases of salaries, bonuses, allowances for the increased cost of living; but the total rise did not more than double their former earnings, whereas prices were very much more than doubled. During the first half of 1921 wholesale prices showed a downward tendency, and there were also signs of a slight decline in retail prices.

*Finance.*—In 1913–4 the budget revenue was 2,245 million lire, and there was no deficit. The budget for 1921–2 was estimated as follows: revenue 14,786 million lire; expenditure 24,497 million lire, divided as follows:—(*a*) ordinary recurrent expenditure (interest on the debt, peace-time military expenditure, colonies, civil service, railways, etc.) 11,806 million lire; (*b*) extraordinary non-recurrent expenditure for the liquidation of the war (military expenditure connected with the Armistice, maritime transport, bread subsidy, extra expenses due to the unfavourable exchange) 9,807 million lire; (*c*) expenditure due to the war, but of a less transitory nature (war pensions, indemnities for war losses, reconstruction in the liberated provinces) 2,884 million lire. A deficit was thus shown of 9,711 million lire; but it was anticipated that, by the dropping of the bread subsidy and other steps, this could be considerably reduced.

The cost of the war, to Nov. 30 1918, amounted to 48,490 million lire, not including certain sums still owing, while the long delay in the settlement of the Adriatic question added very considerably to post-war military expenditure. The public debt rose from 15,705 million lire on Aug. 1 1914, to 70,599 on Feb. 28 1919, and 108,072 on Oct. 31 1920. Excluding the paper currency which bears no interest and the 20,600 million lire of foreign debt *on* which no interest was being paid, the interest-bearing debt amounted to 65,000 million lire, of which the annual service was 3,000 million lire. The foreign debt, mostly held in the United States, was in 1921, owing to the depreciation of the Italian currency, equivalent to 80,000 or 90,000 million lire, with interest accumulating at the rate of about 3,000 per annum. The foreign debt was a much debated problem, and although the Italian Government had repeatedly confirmed its intention of meeting its obligations, public opinion demanded that some arrangement should be agreed to by the creditor Allies, bearing in mind Italy's financial difficulties, the fact that the money was lent when Italian currency was almost at par, whereas if payment were immediately exacted the country would have to disburse nearly four times that amount, and the consideration that a large part of the loans served to pay for war material and supplies at a rate allowing for very large profits. At all events it was expected that Italy would be accorded a long delay so as to allow for an improvement of the currency and other facilities.

In 1914 the lira was at par; during the war its value declined (see EXCHANGES, FOREIGN); but after the Armistice the decline was far greater, and the fluctuations in exchange were such as to render the most ordinary commercial transactions with foreign countries highly speculative operations. The depreciation of the lira was due partly to the greatly increased inflation and partly to the unfavourable trade balance, as well as to the constant strikes and disorders, which diminished public confidence abroad. The £ reached 105 lire in the autumn of 1920, the Swiss franc 4·53, the French franc 1·90, the dollar 28·58 lire.

The capital invested in Italian limited liability companies (mostly industrial and commercial undertakings) increased very rapidly in 1914–20. In 1911 the amount of new capital invested was 310,800,000 lire, whereas in 1920 the figure was 3,077,385,134 lire, from which 168 lire must be deducted for capital withdrawn, leaving an addition of 4,834,541,956, or about two milliards more than the average of the two preceding years. In comparing these figures with those of the pre-war period the decreased value of money must be taken into account, but even so the increase is considerable. In all from 1911 to 1920 over 14½ milliards of new capital were invested, and the net increase was over 13 milliards.

The co-operative movement in Italy greatly developed during 1900–20, and was acquiring ever greater importance. In 1915 there were 7,429 co-operative societies (production and labour 3,022, consumption 2,408, farming 1,142, building 752, insurance 105). The membership was nearly a million, and the capital over 118 million lire, with a turn-over of nearly 650 million lire in one year. The co-operative movement is favoured by all parties—Socialist, Catholic and Liberal, while the Government confers many privileges on the societies, including exemption from taxation and preference in the assignment of contracts for public works. Unfortunately, they were also exploited for party purposes; and cases were known in which groups of five or more persons formed themselves into a bogus co-operative society in order to obtain valuable Government contracts on easy terms. The Socialists of Emilia were particularly active in this connexion.

*Agriculture.*—The production of cereals declined during the war years owing to the scarcity of labour, and after the Armistice on account of bad harvests and of the Government requisition of crops at inadequate prices.

*Production of Cereals, in 1,000 quintals.*

| | Wheat | Indian Corn | Oats | Rice | Other Cereals | Total |
|---|---|---|---|---|---|---|
| 1909–14 (average) | 49,272 | 25,682 | 5,118 | 4,867 | 3 436 | 88,375 |
| 1919 | 46,204 | 21,806 | 5,936 | 4,867 | 2,074 | 80,887 |
| 1920 | 38,500 | 22,000 | 3,500 | 4,300 | 2,430 | 70,730 |

The harvest of 1920 was exceptionally bad; prospects for 1921 were better, as the Government requisitions were gradually ceasing.

The grape-producing area of Italy was in 1909–14 4,400,000 hectares, or nearly half of the world total, but the wine produced—45,500,000 hectolitres—was only 3/10 of the whole, as a large part of the land under grapes is cultivated by small farmers for their own use and not with the scientific intensity of the French or Rhenish vineyards. During the war the wine output fell to an average of 35,800,000 hectol. and in 1919 to 35,000,000 hectol.; in 1920 it rose to 42,000,000 hectol., the new provinces excluded. Only a comparatively small part was exported: in 1909–13 the yearly average was 1,410,000 hectol. and 180,000,000 bottles; in 1919 it had fallen to 638,000 hectol. and 87,000,000 bottles.

Olives were cultivated over 2,300,000 hectares before the war, producing 10,769,000 quintals of olives, from which 2,200,000 hectol. of oil were extracted, valued at (including by-products) over 300,000,000 lire. The output during the war years was about the same; in 1919 there was a slight diminution of the better qualities. Exports before the war averaged 340,000 hectol. and in 1919 were 86,000, with prospects of improvement.

Fruit is an important item in Italy's agricultural production, and one capable of considerable development, but it has been hampered by want of organization and lack of capital among the producers, the excessive numbers of intermediaries, and insufficient care in packing and preserving. In the period 1909–14 the average crop of *agrumi* (oranges and lemons) was 7,888,000 quintals; chestnuts, 6,070,000; apples, pears, quinces, pomegranates, 2,823,000; almonds, nuts and walnuts, 2,388,000. During the war years the averages for these crops were 7,347,000, 6,642,000, 2,468,000 and 1,288,000; in 1919 the decline was further accentuated (6,625,000, 4,900,000, 3,104,000 and 881,000). Prospects for 1920 were better.

The production of silk cocoons in 1909–13 was 41,000,000 kgms. according to Government statistics, or 46,000,000 kgms. according to those of the Silk Association; but even this figure is said to be an undervaluation, and 50,000,000 appears to be nearer the mark. During the war the output was about 42,000,000; it fell to 23,500,000 in 1919, owing to unfavourable weather conditions, but it rose to 35,500,000 in 1920. The hemp crop improved steadily after 1914, owing to the great demand and increased price of textiles; whereas it was 860,000 quintals in 1909–14, it averaged 880,000 in the war years, rose to 940,000 in 1919 and to 960,000 in 1920. The wool crop, which was 280,000 quintals in 1909–13, rose to 300,000 in 1920 (valued at 500,000,000 lire).

*Mining.*—Italy has no coal-mines and therefore has to import all her coal. Lignite mines, however, exist in various parts of Italy, and the war stimulated their development owing to the urgent need of fuel and the ever-increasing cost of imported coal. Thus, while in 1909 355,000 tons were extracted, in 1918 the amount was 2,171,000 tons; in 1919 it fell to 1,458,000, and in the first half of 1920 600,000 tons were extracted. The chief source of the coal supply before the war was Britain; in 1909–13 the average annual imports were 9,820,000 tons, of which 8,810,000 came from Britain alone. During the war, owing to the greatly increased cost and difficulties of transport, the imports fell to 7,430,000 (6,680,000 from Britain), and in 1919 to 6,220,000, of which only 4,690,000 from Britain, while the United States sent 1,060,000 as compared with 80,000 in 1909–13. In the first half of 1920 only 2,800,000 tons were imported (1,880,000 from Britain and 680,000 from the United States).

* These figures indicate the volume and not number of the previous article.

The tendency to try to tap other sources of supply than the United Kingdom was increasing; more and more coal was being imported from the United States, Germany, the Saar basin, etc. Much was also hoped from the Heraclea concession on the Black Sea. Prospects for 1921 were more satisfactory; the demand was less owing to the industrial crisis, and supplies more abundant and cheaper. Before the war coal cost about 40 lire per ton in Italy; during the war and at certain periods after the Armistice it rose to as high as 800 lire. At the end of 1920 it had fallen to 650 lire, and lower in 1921.

Italy is almost as poor in iron as in coal, but she had nevertheless developed her iron and steel industry to a fair degree. In 1909–13 the average annual amount of iron ore mined was only 535,000 tons while the yearly output of iron and steel was 1,048,000 tons. During the war, owing to imperious military necessities, mining was greatly intensified, and in 1917 1,000,000 tons of iron ore were extracted; in 1918 the amount fell to 695,000, and in 1919 to 466,000, owing to the reduced demand. The total known deposits are estimated at only 40,000,000 tons, but the amount is probably larger, and the Cogne mines in the Val d'Aosta and those at Nurra in Sardinia are capable of much greater development. The output of iron and steel during the later years was as follows:—1913, 933,000; 1914, 911,000; 1915, 1,009,000; 1917, 1,332,000; 1918, 993,000; 1919, 732,000 tons. In 1913 840,000 tons of iron, steel, scrap iron, rails, pipes, plates, etc., were imported; 789,000 tons in 1919, and 378,000 tons in the first half of 1920.

*Electric Power.*—Electric power and its applications have been developed to a very high degree in Italy, and extensive use has been made of the water-power, which is taking the place of steam in many fields of industrial activity. In 1914 900,000 H.P. produced by water-power were in use, and at the end of 1920 the figure had risen to 1,500,000. There is still a great deal more water-power available, notably in the newly annexed territories, but the high cost of setting up new plant and of materials and labour has been a deterrent to further development. There are several lines with electric traction, of which the most important are the Simplon tunnel, the Turin–Modane line with the Mt. Cenis tunnel, Genoa–Arquata, Genoa–Savona, Milan–Sondrio, Naples–Piedimonte d'Alife. It was intended to adopt electric traction on several other lines as soon as possible, including the new Rome–Naples short line which was under construction in 1921. Altogether it is estimated that there are 3,000,000 H.P. available in Italy.

*Raw Materials.*—Scarcity of raw materials seriously handicapped Italy during the war, but then, at least, the Allies accorded her certain facilities for obtaining them. After the Armistice not only were these facilities withdrawn, but several countries imposed what practically amounted to export duties on raw materials, while in some cases they altogether prohibited their export. The worst difficulties were those connected with coal and wheat. The system, by which British coal was being exported in 1919–20 at a far higher price than was charged to the home consumer resulted in Italian consumers having to pay 55s. more per ton than the British, which with the £ exchanging for 90 lire, meant an annual tribute on 4,000,000 tons of 1,000 million lire, not counting freights. Even apart from this discrimination the Italian consumer had to pay four times as much as the British for coal. For a long time British coal enjoyed a practical monopoly of the Italian market, as there were few other sources of supply available. Afterwards American and German coal came to be imported into Italy in increasing quantities, and the British discrimination was removed. Argentina for a time imposed an export duty on wheat, and afterwards prohibited its export altogether. France stopped the export of scrap iron, of which Italy had great need. All these restrictions caused much hardship and not a little ill-feeling. At the Brussels Financial Conference (Sept.–Oct. 1920) the Italian delegates complained of the tendencies of certain countries richer than Italy in raw materials to improve their budgets by raising their export prices, and asked for freedom of circulation for raw materials. Senator Schanzer, Italian delegate at the League of Nations Assembly in Dec. 1920, supported the theory of economic solidarity, demanding that artificial barriers and differential prices should be eliminated and that the whole world be regarded as one great economic system.

*Trade.*—Before the war, Italy's trade returns had shown annual imports from 25% to 50% higher than the exports. But the difference was made up by "invisible" exports—the sums sent or brought home by emigrants, those spent by foreigners in Italy, freights earned by Italian ships, etc. During the war and after the Armistice the trade deficit grew very considerably, owing to the immense quantities of war material and foodstuffs which had to be imported, without a corresponding increase of exports, visible or invisible. In 1919 the imports amounted to 13,677,169,245 lire and the exports to 4,500,653,431 lire. The following year the imports declined slightly to 13,038,034,351 lire, while exports rose to 6,219,385,088 lire.

*Transport.*—The total railway system of Italy increased from 3,738 m. in 1870 to 11,895 m. on Dec. 31 1919, to which must be added 870 m. for the new territories. Before the war there were 6,000 locomotives, 12,000 passenger coaches and 115,000 goods vans and trucks. After 1914 the rolling-stock slightly increased, but a good deal of it was worn out during the war and would have been scrapped had it not been for the difficulty of obtaining new material. On June 30 1919 there were building 860 locomotives and 17,600 card of all sorts, but the necessary repairs to the old ones were going on very slowly, and a large number of passenger coaches remained in a very bad state. The number of railwaymen before the war was 170,000. During the war a number of men were taken on temporarily (*avventizi*) to replace those who were serving in the army, and after the Armistice, when the old ones were taken back, the new ones were not dismissed; this fact, the introduction of the eight-hour day, and the decreased efficiency of the bulk of the railwaymen, resulted in a large addition to the staff. The State railways alone, which before the war employed 154,000 men, had 200,000 on their pay-rolls in 1921. In 1913 the railways transported 130 million passengers and 47 million tons of goods, and the revenue was 655 million lire, which was 45 millions less than the sum necessary to cover expenditure, including the 3½% interest. The inadequacy of the revenue was due to the low traffic of the lines in the south and in the islands, which were also the most costly to build. During the war the traffic increased considerably, but more than half of it was war traffic; expenses also increased enormously, owing to the rise in the price of coal, the inferior quality of much of the fuel used, and the huge increase of wages, which varied from 158% for the higher management to 643% for the lowest grade of linesmen in 1920–1 as compared with 1913–4. Expenses in 1920–1 were 1,800 million lire for wages, 1,000 million for fuel and 500 million for other items—a total of nearly 3,500 millions. The revenue was barely 2,000 millions, in spite of the increase of the tariffs.

The total length of the interurban tramway system (steam and electric) was 2,796 m. in 1921 and that of the motor-omnibus service, conveying passengers and goods, was 8,700 m. in 1917.

*Shipping.*—The total tonnage of Italy on Aug. 1 1914 was 1,534,738; her losses during the war were higher in proportion than those of any other country, amounting by Nov. 11 1918 to no less than 905,393 tons, or 58·93% of the whole mercantile marine. But the large development of shipbuilding, encouraged by high freights, and the addition of the greater part of the Austro-Hungarian shipping, brought up the total to more than the pre-war figure—2,118,000 tons. Freights rose during the war from 9 to 15 times what they were before, and in 1921 were still three times the pre-war rate. In 1913 31,800,000 tons of goods were transported on Italian ships; the amount fell to 16,800,000 in 1918, rose to 19,200,000 in 1919, and continued to increase slightly until 1921.

## History 1909–21

The general elections of March 1909 had returned a strong majority in favour of the Government of which Sig. Giolitti was the head. A new Shipping Subsidies bill was now introduced by the premier, the old agreements with the steamship companies having lapsed, but attacks made on the measure by the opposition, led by Baron Sonnino, so shook the Cabinet's position that Sig. Giolitti deemed it prudent to adjourn the debate until the autumn. When Parliament reassembled he modified the steamship bill, but the Cabinet was defeated on a point of procedure and resigned on Dec. 2. Baron Sonnino was now called upon for the second time to form a Ministry, which comprised some of the best brains in Italy—Count Guicciardini (Foreign Affairs), Sig. Luzzatti (Agriculture), Sig. Salandra (Treasury), Admi. Bettolo (Marine), and Gen. Spinfardi, who remained at the War Office. But the new Government, though widely supported in the country, had no stable majority in the Chamber, which was still Giolittian at heart. On March 21 it was defeated over the new shipping bill and resigned. Sig. Luzzatti succeeded, with the Marquis di San Giuliano at the Foreign Office, Admi. Leonardi Cattolica as Minister of Marine, and Signori Tedesco, Facta, Credaro and Sacchi in other departments. In spite of his great financial ability and abundant self-confidence, the new premier proved unequal to his task, and it was obvious to all, save to himself, that he only held office on sufferance, until Sig. Giolitti saw fit to return to power after the shipping bill and one or two other awkward questions had been disposed of. The Government was extremely feeble in dealing with agrarian disorders in Romagna and other internal troubles. On Dec. 21 there was a division on the Cabinet's extension of the Franchise bill; although a majority voted in its favour, the Radicals opposed it, and the two Radical ministers (Sacchi and Credaro) felt bound to resign. The whole Cabinet followed suit on March 18 1911. The King sent for the inevitable Giolitti, who formed a new Cabinet comprising most of the former ministers, including Sacchi and Credaro. Sig. Bissolati, one of the leading but moderate Socialists, declined office at the last moment.

The year 1911 being the 50th anniversary of the creation of the Italian Kingdom, exhibitions were organized in Rome, Turin

and Florence; but although they proved interesting in themselves, defective management, an exceptionally hot summer and an outbreak of cholera made them financially unsuccessful; the charges of dishonesty brought against certain officials in connexion with them proved, however, unfounded.

The Cabinet's programme, presented to the Chamber on April 6, included an extension of the franchise, increasing the number of voters from three millions to eight, the payment of members, and a Government monopoly of life insurance. These bills were chiefly designed to win the favour of the Extreme Left, but found little support in the country and aroused much opposition even in Parliament, especially as regards the insurance bill. The monopoly, however, eventually became an important source of revenue. The final debate on these bills was adjourned to the autumn, and the Chamber rose on July 10. In the summer a dispute broke out with Argentina over the sanitary measures which the latter wished to impose on Italian immigrants in connexion with the cholera epidemic. An agreement was concluded on Aug. 17 1912, giving full satisfaction to Italy.

*War with Turkey.*

During the last few years relations with Turkey had become strained. With the advent to power of the Young Turks the situation got worse instead of better, and the new Ottoman Government, while hating all things foreign, showed particular animosity towards Italy, whom it regarded as the weakest of the Great Powers. Italian enterprise throughout Turkey was hampered, especially in Tripolitana, where Italy's reversionary interest had been recognized by Britain and France. Italy had intended to extend her influence in that province by peaceful means, but numerous diplomatic incidents embittered the feeling on both sides, while the reopening of the Morocco question by Germany made it clear that the last unoccupied lands in the Mediterranean were about to be divided up, and that Italy's final chance of acquiring a colony on the North African coast had come. The Nationalist party, which had been constituted at the Florence Congress in Dec. 1910, had conducted a propaganda in favour of a more vigorous foreign policy, in opposition to the professed anti-patriotism of the Socialists and the sentimental pacifism of the Democrats and now roused public opinion to the need for bold action. Although the Cabinet was anxious to avoid international complications it could not afford to disregard the new spirit animating the Italian people. In July it informed the Powers that the conduct of Turkey was becoming intolerable, and as no improvement in the situation occurred, military preparations were commenced on Sept. 20. On the 23rd the class of 1888 was called back to the colours, and on the 26th a Note was presented to the Porte calling its attention to the risks to which Moslem fanaticism was subjecting Italian residents in Turkey, and adding that the sending of reënforcements or arms to Tripolitana would be regarded as "a very serious act." The next day the Turkish steamer "Derna," flying the German flag, arrrived at Tripoli and landed 15,000 rifles and much ammunition, which were distributed among the local Arabs. The Italian Government presented an ultimatum to Turkey on the 28th, and, no satisfaction having been obtained, declared war on the 29th (*see* ITALO-TURKISH WAR). Public opinion supported the Government in its African policy, which was not merely a colonial adventure, but represented a patriotic reaction against the bad old policy of "*quieto vivere*," while the gallantry displayed by officers and men offered a welcome relief from the petty bickerings of Parliamentary politics.

On Nov. 4 1911, Italian sovereignty was extended to Tripolitana and Cyrenaica (as the eastern part of the Tripoli vilayet was now called) by royal decree. The international preparation of the African war had been inadequate, and public opinion and the press in foreign countries were not well disposed. The most violent attacks came from the German and Austrian press, and the Austrian Government placed its veto on the extension of Italy's military and naval operations to the Balkans. France was also not too friendly, and the stopping and searching by Italian cruisers of the French steamers "Carthage" and "Manouba" suspected of conveying contraband to the Turkish forces, provoked a serious Franco-Italian diplomatic incident and caused a violent outbreak of anti-Italian feeling in France. Although the episode was settled by arbitration at The Hague, it did not improve relations between the two countries. Various unsuccessful attempts at mediation were made by the Powers, but in July 1912 unofficial negotiations were opened between Italian and Turkish delegates in Switzerland. After laborious discussions the peace preliminaries were signed at Ouchy on Oct. 14, and the final peace treaty on the 18th. Turkey renounced her sovereignty over Libya (as the whole territory was now called), and undertook to withdraw her troops from it, the Sultan retaining only spiritual authority over his former subjects, while Italy agreed to restore to Turkey the islands she had occupied in the Aegean during the war (Rhodes and 11 islands out of the 12 constituting the Dodecanese) as soon as Turkey fulfilled her own undertaking. Although the settlement gave Italy the objects for which she had fought, it was not considered satisfactory by public opinion, which believed that if the Government had conducted the campaign with more vigour and supported the gallant efforts of the troops more adequately, a fuller victory might have been obtained in a shorter time. The total cost of the campaign amounted to 458,000,000 lire, including the value of unconsumed supplies; this sum was paid out of the budget surpluses of the last few years, redeemable Treasury bills, Treasury reserves, credits with banks, etc. No new loans were raised, nor fresh taxes imposed. Business had not been much affected; in fact exports and revenue continued to increase.

An unsuccessful attempt on the King's life by an anarchist named D'Alba on March 14 1912, provoked an enthusiastic demonstration of loyalty among all classes. The insurance monopoly, the extension of the franchise and payment of members were voted without much opposition, as Parliament did not wish to embarrass the Ministry during the war. The Socialist party had always opposed the war because it feared that patriotic feeling would divert public interest from the class war on which Socialism battened. But some of its ablest leaders refused to put party before country and supported the Government's African policy; the result was that at the Socialist Congress of Reggio Emilia (June 1912) they were "excommunicated" by the majority. The party thus split into two separate groups or those who were ready to collaborate with the Constitutional parties, calling themselves "Reformist" Socialists and comprising such men as Sig. Bissolati and Sig. Bonomi, both future Ministers, and the others who remained uncompromisingly hostile to the constitution and assumed the style of "Official" Socialists. The Reformists ended by being absorbed into the Liberal groups, while the Official Socialists assumed a more and more revolutionary attitude.

*Socialist Split.*

In Nov. 1912 a new Ministry of the Colonies was created, with Sig. Bertolini as minister. His attempt to extend to the African territories the less desirable features of the home bureaucratic system greatly hindered their peaceful development. The peace of Ouchy did not immediately put an end to the fighting in Libya. Most of Tripolitana was quickly pacified, except in the Garian, where a large body of rebels under Suleiman el Baruni held out until they were defeated by Gen. Lequio's column at Assaba. The situation proved more difficult in Cyrenaica, where a number of Turkish officers and soldiers, as well as local Arab chiefs, commanded by Aziz Bey and acting under the inspiration of the head of the powerful Senussi sect, organised resistance and caused considerable trouble which resulted in serious fighting. The extent of occupied territory gradually increased, but sporadic outbreaks among the tribesmen of the interior continued.

*Trouble in Tripoli.*

The parliamentary session following on the conclusion of the peace, which was ratified Dec. 4, was a somewhat agitated one. The Socialists attacked the Cabinet for its war policy with their usual violence, supported by a few non-Socialist democrats while the scandals which came to light in connexion with the building of the new Palace of Justice, implicating three or four deputies, provided material for "scenes" in the Chamber. Adml. Leonardi Cattolica

*Triple Alliance Renewed.*

resigned from the Ministry of Marine owing to the Senate's opposition to his naval pensions bill, and was succeeded by Admi. Millo, the hero of the Dardanelles torpedo raid. The Triple Alliance was renewed on Dec. 7 1912. In the labour field the chief event was the strike at the F.I.A.T. works, Turin, which lasted three months and caused a loss of 15,000,000 lire, an agrarian strike in the Ferrara province and a general industrial strike at Milan in the summer of 1913.

The Balkan War had broken out when the Libyan War had ended. After the victories of the Balkan Allies over Turkey the Serbs had descended to the Adriatic and occupied Durazzo, while the Greeks from the south invaded South Albania. Austria, not wishing the Serbs to have an outlet on the Adriatic, demanded the evacuation of Durazzo, and was supported in this demand by Italy, both because she was a member of the Triple Alliance and because she had always felt an interest in the Albanians. She also opposed the Greek advance into South Albania for similar reasons, and because she did not wish Valona to fall into the hands of a possibly hostile power, who might use it or let others use it as naval base against Italy. Austria and Italy therefore agreed on the creation of an independent Albanian state under the protection of the Great Powers. Italo-Austrian relations had often been strained to breaking point, but the Marquis di San Giuliano's foreign policy was based on a complete agreement with Austria, and he hoped to achieve his end by removing one of the chief causes of conflict—the struggle for influence in Albania. In spite of this settlement, the petty persecutions by the Austrian Government against its Italian subjects, the frequent anti-Italian utterances of prominent Austrian generals and public men and the constant expulsions of Italian citizens from Austria for the most trifling pretexts, served to keep up ill-feeling. Just as matters were beginning to improve Prince Hohenlohe, the governor of Trieste, on Aug 23 1913, ordered the municipality to dismiss all foreigners, *i.e.* Italians, from its employ and that of the municipalized public services. Although, after much controversy, the Austrian Government allowed the Hohenlohe ordinance to lapse, the incident left a trail of irritation behind it.

*Relations with Austria.*

On Oct. 26 1913, the general elections with the extended franchise were held, followed by the second ballots of Nov. 2. The result was an increase in the Socialist vote. Socialist victories were particularly notable in Milan, Florence, Turin and Naples. Although some 300 Constitutionalists were returned, the Cabinet was faced by 53 Official Socialists, 26 Reformist Socialists and 70 Radicals of uncertain attitude; the Republicans were much reduced, while 38 Catholics were elected—it was the first time that a real Catholic party presented itself to the polls, a fact which the Pope had rendered possible by withdrawing the *non-expedit*. The Nationalists, who alone had the courage to attack the Socialists with vigour, captured all the five constituencies which they contested. Of the new members the very eloquent Sig. Raimondo (Reformist Socialist), and Sig. Federzoni (Nationalist), were real acquisitions for Parliament. A number of anti-Giolittians of all shades were elected, and Sicily for the first time returned several anti-Government members. The elections were accompanied by some serious disorders, for which both Sig. Giolitti and the Official Socialists were responsible.

*Elections of 1913.*

A considerable sensation was caused soon after the elections by a statement made by Count Gentiloni, president of the "Unione elettorale cattolica," that 228 of the Constitutional members owed their election to Clerical support, obtained by undertaking to oppose all legislation hostile to Catholic interests. The anti-Clericals rose up in wrath, and many of the 228 indignantly denied having subscribed to the "*patto Gentiloni*." Parliament met on Nov. 27, and the Socialists renewed their attacks on the Cabinet, but there was reason to believe that they were by no means as hostile to Sig. Giolitti as they professed to be, and that, even while giving utterance to virtuous indignation at his shortcomings, they were ever ready for a deal. The Cabinet's African policy was voted by a large majority, and new taxes, estimated to bring in 35 million lire, were imposed on tobacco and alcohol.

The premier's position was now somewhat shaken. The elections had shown that the country was getting tired of the predominance of one man. Giolitti had ruled supreme, save for a few brief interludes, for 10 years. He now realized that the Albanian tangle, the need for fresh taxation, the divisions among his own supporters over the question of Catholic support, and the rumours of a threatened railway strike, were likely to cause considerable difficulties in the immediate future, and that a period of rest *procul negotiis* was desirable for his health. He therefore seized the occasion of a hostile vote of the Radical group to resign on March 10 1914. Sig. Bertolini, his chief henchman, having spoilt his chances by his mismanagement of the Colonial Office, Sig. Antonio Salandra, who had been Treasury Minister in the second Sonnino Cabinet, was induced, after protracted negotiations, to take office. He enlisted some of the best political men in Italy San Giuliano (Foreign Affairs), Adml. Millo (Marine), Ferdinando Martini (Colonies), Dari (Justice), Ciuffelli (Public Works), Daneo (Education), Cavasola (Agriculture and Trade), Rubini (Treasury), Rava (Finance) and Riccio (Posts and Telegraphs). Gen. Spimgardi refused to remain at the War Office, and several other generals to whom the portfolio was offered would not accept it, as they could not obtain from the Treasury the amount necessary to reorganize the army and replenish the depots left empty after the Libyan War. Finally Gen. Grandi was appointed.

*Salandra Succeeds Giolitti.*

The first problem which the new Cabinet had to face was the truculent attitude of the Sindacato dei Ferrovieri, a nominally economic but in reality a revolutionary political organization of railwaymen. The Sindacato began by demanding a general rise of wages for the whole staff, threatening a strike in case of non-compliance. The Government recognized that the lowest categories were inadequately paid, and was ready to grant them an increase involving an outlay of 15 millions; but it could do no more, as the railways barely paid their working expenses. The railwaymen blustered and threatened, but adjourned the strike to a more favourable opportunity.

*Strike Movements, 1913.*

On the national festival of the Statuto (June 7) some anarchists, revolutionary Socialists and Republicans at Ancona organized a demonstration to protest against the authorities for forbidding an anti-militarist meeting; riots ensued, and the police, overwhelmed by an armed mob of hooligans, fired on their assailants, killing two and wounding several. This was the signal for a general strike in Ancona which spread to other towns. There were no economic demands, the movement being of a purely revolutionary character, and it was so well organized as to prove the existence of an understanding between the various local groups. The soul of the movement at Ancona was the anarchist Enrico Malatesta, who had been condemned to a long term of imprisonment for murder years ago but had subsequently been amnestied, while in Romagna it was the work of the agricultural syndicates who had been conducting an active campaign at first to improve the conditions of day labourers, but subsequently to get possession of the private estates. The railwaymen at Bologna and some other towns struck, and for nearly a week Ancona, Rome, Florence, Naples, Bologna, Milan and many smaller towns, especially in the Marche, were under mob rule. Gangs of anarchists and thieves terrorized whole districts. A popular reaction, however, soon set in, and the Nationalists organized patriotic counter-demonstrations which cleared the streets of revolutionary elements in the large towns and caused the shops to reopen and the trams to operate. In the smaller centers of the Marche and Romagna, where there was an old tradition of faction fights, the agitation lasted some days longer, and in a few cases ridiculous mock republics were set up. But then large bodies of troops were sent into the rebellious districts and numbers of the leading agitators were arrested, order was restored without recourse to violent measures. The civil authorities had been reduced to impotence, several public and private buildings and churches had been pillaged

and burnt, but not much violence was done to persons, except to the soldiers and police, many of whom were wounded and a few killed. Several of the arrested persons were found guilty and condemned to varying terms of imprisonment, but Malatesta escaped abroad. The Government came in for much criticism on account of its slackness in dealing with this criminal outbreak.

Sig. Salandra's position was not very secure, and while the Socialists lashed themselves into a state of hysteria in their mock indignation over his "reactionary" methods, a group of Giolittian deputies, led by Signori Orlando and Schanzer, tried to make political capital out of the recent disorders and conspired to bring about his fall. But the premier parried the stroke with skill, and the Chamber howled down the plotters. On a vote of confidence the Government obtained a majority of 254 against 112, and the Chamber rose on July 5. The municipal and provincial elections, which had begun in June 14, resulted in some important constitutional victories in Rome, Turin, Genoa, Venice, etc., whereas in Milan and Bologna Socialist town councils were elected. The railway syndicate now threatened another strike if the railwaymen guilty of participating in the June disorders were punished, but this time the Government held firm and let the law take its course, with the result that some 50 railwaymen were dismissed and many others received lesser punishments. At the same time the class of 1891 was called back to the colours.

There now seemed to be some chance of a quiet spell, after all the recent agitations, when suddenly the international situation began to assume an alarming aspect. On June 28 the Archduke Francis Ferdinand and his wife were murdered at Serajevo. Although it was realized that the Austro-Hungarian Government would demand serious guarantees against anti-Austrian propaganda and plots conducted from Serbia, the famous Note of July 23 burst like a bombshell on the Italian as on most other Foreign Offices. The gravity of the situation was grasped at once, for few in Italy doubted that Austria was spoiling for a quarrel whereby she might regain her lost prestige in the Balkans, that she would be supported by Germany, and that Russia would not allow Serbia to be humiliated and perhaps dismembered. The Italian Government coöperated heartily with that of Great Britain in the last desperate efforts to avert a catastrophe. The terms of the Triple Alliance had been kept secret, but, while public opinion realized that if a *casus foederis* were to arise Italy would be in honour bound to stand by her Allies, the idea of siding with Austria, especially in so unpopular a cause, was profoundly repugnant to the immense majority of the nation. Events now moved rapidly.

*The World War.*

To the relief of practically the whole of Italy, the Italian Government on Aug. 3 issued its declaration of neutrality. The grounds on which this decision was based were the following. (1) According to the terms of the Triple Alliance none of the contracting parties might undertake an action likely to compromise the common interests of all without first notifying the other two and coming to an understanding with them; this Austria had failed to do. In the case of Balkan affairs this principle had been reconfirmed by special agreements between Austria and Italy. (2) The Austrian Note to Serbia not having been previously communicated to Italy, the latter had had no opportunity of exercising diplomatic action in favour of peace. (3) The Triple Alliance being essentially defensive in character and based on the maintenance of the territorial *status quo*, Italy was not bound to assist her Allies in an aggressive policy. (4) Not having been warned in time of the intentions of her Allies, Italy had been unable to take the necessary military measures even if she had been willing to assist them. The relief at the proclamation of neutrality was further enhanced when Britain entered the lists against Germany, for it would have been as repugnant to the enormous majority of the Italians to be at war against Britain as to be on the side of Austria. It was afterwards officially announced in Italy that no *casus foederis* could arise in the event of Britain being in the conflict, but at the time the public did not know this.

It was felt, however, that at any moment Italy might herself be involved in the conflict, so that it was necessary to prepare the defences of the country. The classes of 1889 and 1890 were called out, so that, with that of 1891, previously summoned, and the two regular classes of 1892 and 1893, there were five classes under arms, to which the recruits of 1894 were added in the autumn. But the stores had to be replenished, immense quantities of arms and ammunition manufactured, and everything reorganized, as the army had been left in a deplorable state after the Libyan War, because the Giolitti Government had not wished to risk unpopularity by asking for the necessary funds. The work of practically re-creating the army was colossal, and that it was achieved in a few months is chiefly the merit of the chief of the general staff, Gen. Cadorna, appointed on July 27 1914.

The question which now preoccupied the public was no longer whether Italy should intervene in favour of the Central Empires or not, but whether she should remain neutral until the end of the war or intervene on the side of the Entente. The *Triplicisti* were fairly numerous among the diplomatists and in a part of the army, but hardly anyone went so far as to advocate intervention on the side of Germany and Austria; German violation of Belgian neutrality and the German atrocities in their conduct of the war had alienated many sympathizers. The Nationalists, Radicals, Republicans, Reformist Socialists and a large section of Liberals of various shades, realizing that this war would be the last opportunity for completing Italian unity, were in favour of intervention against Austria with the primary object of liberating the Italian territories of the Dual Monarchy. The Official Socialists declared for absolute neutrality, on the orthodox Socialist theory that all wars are wicked (except class war) and waged only for the benefit of the capitalists; the party afterwards developed this theory into a more or less avowed sympathy with Germany and Austria. On the other hand a large number of Socialists rejected this policy and favoured Italian intervention, provided it was on the side of democratic France; even Benito Mussolini, the fiery editor of the Socialist *Avanti*, resigned his appointment when the party voted for neutrality, became one of the more ardent interventionists, and fought himself as a volunteer in the war. The Catholics were opposed to intervention against the Central Empires because they disliked France as the "atheist" nation, admired Catholic Austria and feared the triumph of Orthodox Russia. A good many people, even in the upper classes, were opposed to intervention, apart from any question of sympathy, because they were afraid of Germany and thought she was bound to win. A still larger class, belonging to all parties and representing perhaps the bulk of public opinion, hesitated on the ground that though Austria had not shown much regard for Italy's interests or feelings, it would be wrong to attack an ally without a definite *casus belli;* they felt that it was advisable to wait for fresh developments of the situation and only intervene when there should be a real danger that the unredeemed provinces might be annexed by some other Power. This view prevailed until about the end of March 1915, and the Government was supported on this understanding.

The economic effects of the war were at first severely felt. Prices did not rise to any great extent, but there was a run on the banks which necessitated a moratorium. For a few weeks many factories had to shut down owing to lack of funds, while large numbers of temporary emigrants (estimated at 350,000) in Central Europe were forced to return home on the outbreak of hostilities. All this produced a considerable amount of unemployment. But the measures adopted by the Government and the activity of many private committees alleviated the distress, and more or less normal conditions were gradually restored. The moratorium was made less stringent, and an agreement with Britain averted the danger of a coal famine, although in the spring of 1915 the price of coal rose considerably; other raw materials were again imported after a short suspension due to the interruption of maritime traffic, and the Italian steamship lines did profitable business. The export of food-stuffs, of certain other goods and of war material was prohibited; in Oct. 1914

*Economic Effects of the War.*

the import duty on wheat was reduced by more than one-half to make up for the rise in freights, and in Dec. it was removed altogether. By somewhat relaxing the export prohibition Italy saved Switzerland from famine and sent large shipments of sugar to Britain.

Internal affairs aroused little interest, as public attention was monopolized by the war, and even the death of Pope Pius X. and the election of Benedict XV. passed almost unnoticed. On Oct. 9 Gen. Grandi resigned from the War Office on account of a disagreement with Gen. Cadorna over the needs of the army, and was succeeded by Gen. Zupelli (a native of the unredeemed provinces), who provided the chief of the staff with the necessary supplies. A week later the Marquis di San Giuliano died, and the premier temporarily took charge of the Foreign Office.

Throughout the autumn anarchy had been spreading in Albania and soon after the outbreak of war Prince William of Wied and the foreign contingents had departed. The Greeks had seized the opportunity to invade and devastate South Albania, and Italy feared that they or one of the belligerent Powers might occupy Valona, which would be a serious menace to Italian security. A landing party from the Italian fleet began by occupying the islet of Saseno, which dominates Valona harbour, on Oct. 30. On Dec. 26 sailors landed in the town, followed by a regiment of infantry.

*Valona Occupied.*

A new Cabinet crisis now occurred. Sig. Rubini, the Treasury Minister, refused to supply the funds required for the army unless they were immediately covered by corresponding increases of revenue. Sig. Salandra, however, realizing that a new scheme of financial reform required time, whereas military necessities were urgent, backed up Gen. Zupelli; Rubini resigned on Oct. 31, and the whole Cabinet followed suit. But the King, after consulting the leading statesmen, entrusted Salandra himself with the formation of a new ministry. This was accomplished by Nov. 5; the chief innovation was Baron Sonnino at the Foreign Office, an appointment which strengthened the Cabinet considerably; other new appointments were Orlando (Justice), Grippo (Education), Daneo (Finance), and Carcano (Treasury). Thus the Cabinet came to represent practically every section of the Chamber except the Extreme Left. On Dec. 3 Parliament met, and Sig. Salandra in a dignified speech explained the reasons for Italy's neutrality and insisted on the necessity for the nation to be well armed so as to defend her interests and realize her aspirations. It was on this occasion that the premier pronounced the famous and much-discussed phrase about "*sacro egoismo*," *i.e.* the duty of subordinating everything to the higher interests of the country.

*Sonnino Foreign Minister.*

The intervention of Turkey on the side of the Central Empires affected Italy very closely, for there was every reason to doubt that the limitation of the Holy War, proclaimed by the Sultan at Germany's suggestion, to the territories held by the Entente Powers would be respected. These doubts proved indeed justified, and there was a recrudescence of rebellion among the tribesmen of Libya, fomented by German as well as by Turkish agents. On Dec. 17 Prince von Bülow, the new German ambassador, arrived in Rome with the mission of exerting all his influence, through his aristocratic and political Italian connexions, to secure Italy's neutrality to the end of the conflict.

The year 1915 did not begin auspiciously for Italy; on Jan. 13 an earthquake of unusual severity was felt over a large part of Central Italy, and destroyed Avezzano and many other smaller towns and villages in the Abruzzi and the provinces of Caserta and Rome. The total number of victims was 30,000.

The diplomatic activity of the Government was now greatly intensified. The current in favour of intervention was growing ever stronger, in spite of Prince von Bülow's efforts and the pacifist tendencies of certain classes. But both Sig. Salandra and Baron Sonnino were determined that Italy should not emerge from the European conflict without realizing at least a part of her aspirations, acquiring some of the Italian districts of Austria and correcting the iniquitous frontiers of 1866 designed to leave the country at the mercy of invasion. As early as Dec. 1914 the Italian Government had called Austria's attention to the fact that the invasion of Serbia tended to destroy the balance of power in the Balkans; Art. 7 of the Triple Alliance Treaty gave Italy, in these circumstances, a right to compensation. Austria at first rejected this claim *in toto*, then admitted it grudgingly, but offered Italy by way of compensation territories belonging to her enemies (Nice, Corsica and Tunisia were mentioned). Baron Sonnino, however, insisted that only territories already in Austrian possession could form a basis for negotiation. To this Austria gave evasive replies and then offered a small part of the Trentino, to be ceded after the war. But Sonnino replied that no territorial cession could be considered unless it was to be made at once. Germany did her best to bring about an agreement between Italy and Austria, and tried hard to induce Austria to be more conciliatory. Austria having at last reluctantly accepted the principle of immediate cession, Sonnino presented Italy's minimum demands. These were: the Trentino as far as the frontiers of the Napoleonic kingdom of Italy, a strip of territory in the Isonzo valley comprising Gorizia, Gradisca and Monfalcone, and the Curzola group of islands in the middle Adriatic, to be ceded to Italy; Trieste and the N.W. part of Istria to form an independent state; Italy to have a free hand in Albania. In return Italy would remain neutral to the end of the war. But Austria, still convinced that Italy had no intention of going to war and was merely bluffing, continued to raise objections, in spite of the extremely candid remarks of the German Government. Italy now came to the conclusion that agreement was impossible and that war was inevitable.

*Foreign Negotiations.*

Negotiations for intervention were opened with the Entente, and on April 26 an agreement was concluded with Britain, France and Russia known as the Pact of London; it was in reality a memorandum presented by Italy and agreed to by those Powers, and completed by military and naval conventions. Italy was to conduct the war against the Entente's enemies with all her means, and was to receive the following compensation at the end of the war:—The whole of the Trentino and South Tirol as far as the natural geographic frontier, *i.e.* the Brenner range; the city and district of Trieste; the county of Gorizia and Gradisca; Istria to the Quarnero, including Volosca and the Istrian islands; the islands of Cherso and Lussin and some adjoining smaller islands; Dalmatia as far as Cape Planka, with some of the Dalmatian islands; Valona and its district; and full possession of Rhodes and the Dodecanese. In Southern Asia Minor she was to have a zone of influence and a share in its partition if it should be effected. If Great Britain and France obtained any part of the German colonies in Africa Italy was to be compensated by French and British colonial territories adjoining her own possessions. The E. coast of the Adriatic from Cape Planka to the Voyusa was to be neutralized, except from a point S. of the Sabbioncello peninsula to 10 km. S. of Ragusa Vecchia. The Croatian coast, with Fiume, and the Dalmatian coast S. of Cape Planka, was to go to Serbia, Croatia and Montenegro. If a neutral Albanian state were created its foreign policy was to be under Italian guidance, but if Britain, France and Russia so desired Italy would not oppose the cession of the northern and southern districts of Albania to Serbia, Montenegro and Greece. The Pact of London was kept secret, but most of its clauses soon became known. It was first published by the Russian Bolshevists after the revolution in 1917.

*Pact of London.*

The poet Gabriele D'Annunzio, by his fiery eloquence, largely influenced Italian public opinion in favour of intervention, particularly by his speeches at Quart near Genoa and in Rome. On May 3 Italy declared that the Alliance with Austria was at an end. Prince von Bülow, realising that this meant war, made a last desperate effort to save the situation through Sig. Giolitti's ambition. That politician could not resign himself to be out of office at this critical juncture, and, as his friends declare, he genuinely believed that Italy's interests could best be served by neutrality. On the eve of the reopening of Parliament he returned to Rome, and, although the premier had informed him that the Alliance was dissolved and that Italy had contracted obligations

*Rupture with the Triplice.*

with the Entente, he announced, in a public letter to his faithful henchman Sig. Peano, that he believed still that Italy might obtain a great deal (the famous *parecchio*) without going to war. He knew that he could rely on a majority in the Chamber (300 deputies left cards on him during those days), and that if he declared his opposition the Cabinet was bound to fall. Salandra realized this too and on May 13 he resigned, on the ground of the disagreement between the various Constitutional groups as to Italy's foreign policy, but in reality in consequence of Giolitti's manœuvre. It seemed as though the latter's triumph were assured, but at this juncture the true voice of the country made itself heard. Huge demonstrations against Giolitti, and in favour of Salandra and the war, were held in every town, and in an instant the whole political system built up by Giolitti was swept away. The various leading political men summoned by the King all advised him to refuse Salandra's resignation, as he evidently enjoyed the country's favour, and this advice was followed. Prince von Bülow now informed Giolitti of Austria's final offer (before communicating it to the Government), which comprised, besides the Trentino, a strip of territory as far as the Isonzo, the town of Gradisca, but excluding Gorizia and all the east bank of the river, while Trieste was to be autonomous. But it was now too late, even if Austria's terms had been satisfactory.

On May 20 Parliament met, and the Chamber granted the Cabinet full powers by a large majority, only 74 members (about half of them Official Socialists and the rest impenitent Giolittians) voting against it. Giolitti himself retired to Piedmont, while most of his supporters disappeared or voted for Salandra. The Senate, in spite of its strong neutralist tendencies, voted the bill unanimously. Neutralism and Germanophilism disappeared as if by magic. Many former opponents had been genuinely converted, to a large extent by the revelations contained in the official "Green Book," which set forth the diplomatic history of the preceding months, while others found it expedient to draw a veil over their feelings. The Official Socialists remained in opposition, but they thought it safer not to run counter to the general trend of public opinion too openly, and so kept in the background. On May 23 the general mobilization was ordered and on the 24th war against Austria declared. It was not then declared against Germany, but the German ambassador, his staff, the consuls and most of the German residents left Italy together with the Austrians. The Austrian, Prussian and Bavarian representatives to the Holy See also departed, although the Italian Government did not oblige them to do so. The outbreak of war was received with sober enthusiasm. The mobilization had to a considerable extent been carried out already, and the staffs of many corps as well as large numbers of troops had been concentrating in the Veneto for some weeks. Consequently there was no general disorganization of the economic and commercial life of the country. In July an internal loan at 4½% was floated and brought in 1,100 million lire. A new member was added to the Cabinet in the person of Sig. Salvatore Barzilai, deputy for Rome, without a portfolio but entrusted with the civil affairs of the Austrian districts occupied by Italian troops. The significance of the appointment lay in the fact that he was one of the leaders of the Republican group in the Chamber, but, being a Triestino, he was an irredentist first and a Republican afterwards.

*Italy declares War.*

Although Italy did not declare war on Turkey, Italian subjects in the Ottoman Empire were persecuted and those in the Asiatic provinces prevented from leaving, while the Turkish Government continued to send officers, emissaries, funds and supplies to foment rebellion in Libya, in violation of the Treaty of Ouchy. On Aug. 3 the Italian ambassador at Constantinople presented an ultimatum to the Porte, and, no satisfactory reply having been received, war was declared on the 21st. When Bulgaria invaded Serbia in Sept. 1915 Italy followed the example of her Allies and declared war on the former. No operations were conducted either against Turkey or Bulgaria except the bombardment of the Bulgarian port of Dede Aghach by an Italian cruiser. In Dec., in view of the invasion of Serbia by Austrian, German and Bulgarian armies which constituted a menace to Albania, an expeditionary force was sent to that country. The Albanian expedition, in addition to other operations, was instrumental in saving the remains of the beaten Serbian army, which had been driven from its own country by Mackensen's offensive. It is indeed chiefly due to Italian assistance that 150,000 Serbo-Montenegrin troops were spared death by starvation and disease, and could be afterwards transferred to Corfu to refit and eventually to Macedonia to fight again. Large numbers of civilians found a refuge and a cordial welcome in Italy, while some 30,000 Austrian prisoners captured by the Serbs were interned in Sardinia. On Dec. 1 Baron Sonnino informed Parliament that Italy adhered to the London agreement, whereby the Allied Powers undertook not to conclude a separate peace with the enemy.

In Feb. 1916 a new internal loan brought in 3,000 million lire. When the Chamber reassembled on March 1 there appeared to be some opposition to the Cabinet. The Giolittians and the Socialists regained courage from the fact that the war still continued and no decisive success had been achieved on any front, which they hoped would alienate the country from the Government's policy. The interventionists, on the other hand, criticized the Ministry for what they regarded as its insufficient energy in conducting the campaign, and, above all, they were anxious that war should be declared against Germany. Criticisms were also levelled at the Government's economic policy: facilities for the import of wheat and coal had proved inadequate, nor had anything been done to keep down freights, the rise of which had resulted in large increases in the price of many imported goods (coal had risen to six times its normal price). But the general opinion of the country was unfavourable to a change of Ministry, and when Sig. Salandra asked for an explicit vote of confidence, he obtained it on March 19 by 394 to 61, the Nationalist group voting this time with the opposition. On Feb. 7 the Government issued a decree absolutely forbidding trade with Germany. Trade relations had practically been broken off since Italy entered the war, but a small amount of trade had still been carried on through neutral countries; the new measure put an end even to this, and brought the declaration of war against Germany a step nearer.

In the winter of 1915–6 an exchange of visits between Allied statesmen and military chiefs began. In Feb. M. Briand, the French premier, visited Rome, and as a result of his conversations with Sig. Salandra and Baron Sonnino, a joint inter-Allied council was created; the first meeting was settled for the end of March. On March 20 Gen. Cadorna departed for Paris and the French G.H.Q., after which he visited London and then returned to Paris to take part in the above-mentioned council, on which Italy was represented by the premier and the Minister for Foreign Affairs. On the return of the two statesmen to Rome they were visited by Mr. Asquith, the British Premier, who was very warmly welcomed; he also went to the Italian front and was received by the King. Gen. Zupelli resigned from the War Ministry on April 6, as the result of a disagreement with Gen. Cadorna about the Albanian force, which the latter insisted on having under his own control as commander-in-chief and not under that of the War Ministry. Gen. Mornone, one of the corps commanders at the front, succeeded him.

The initial successes of the Austrian offensive in the Trentino and on the Asiago plateau (May 1916) caused a painful impression, as it was the first setback which the Italian troops had suffered and resulted in the first enemy occupation of any part of Italian territory. Coming after a long period of only partial Italian successes, combined with the very heavy losses suffered, it caused a certain revival of anti-war tendencies. There was also much criticism of the Supreme Command, which had apparently allowed itself to be taken by surprise. Gen. Brusati, commanding the I. Army (Trentino–Asiago), was relieved of his command, together with several other generals. As a matter of fact Gen. Cadorna, knowing that the great Russian offensive was imminent, never believed that the Austrians would have attempted their famous

*Italian Reverses.*

*Strafexpedition*,' which, with the forces at their disposal, they could not conduct to a successful issue. Gen. Brusati certainly appears to deserve censure, in spite of the whitewashing he afterwards got from the Caporetto commission. Gen. Cadorna's counter-offensive succeeded in holding back the enemy before Gen. Brussilov's offensive in Galicia had begun. By June 24 most of the lost territory had been regained.

Undoubtedly the Trentino-Asiago offensive weakened the Cabinet's position; the hostility of the Democratic Alliance, composed of the interventionist groups, turned the scale, and on June 10 the Salandra Ministry was defeated on a vote of confidence by 197 to 158; the next day it resigned. It had never had a majority of its own, but had been accepted on sufferance by the Giolittians. But while the latter regarded this result as a success of their own, they were to be disappointed in the outcome, for instead of a new Cabinet being formed from their ranks, the general feeling of the Chamber indicated the veteran statesman, Paolo Boselli, as the obvious successor to Salandra; as he was outside and above the militant factions of the Chamber, he alone could hope to form a national ministry representing all parties. After a laborious crisis he succeeded in his task by June 19. The new premier remained without a portfolio; Baron Sonnino, Gen. Morrone, Adml. Corsi and Sig. Carcano retained their departments; Sig. Orlando passed from the Ministry of Justice to the Interior; the Radicals, Sacchi and Fera, became Ministers of Justice and of Posts and Telegraphs; Meda, the Catholic leader, Minister of Finance; the Reformist Socialist Bonimi Minister of Public Works; Giovanni Raineri Minister of Agriculture; the new Ministries of Industry and Labour and of Transport were assigned to Giuseppe de Nava and Enrico Arlotta; the Giolittian Colosimo obtained the Colonies; while the Reformist Socialist Bissolati, the Republican Comandini, Leonardo Bianchi and Vittorio Scialoja were made ministers without portfolio.

*Boselli Ministry.*

The Austrian spring offensive had delayed Gen. Cadorna's main operations, the objectives of which were Gorizia and Trieste. The attack on Gorizia was begun on Aug. 4, and after 11 days of strenuous fighting the town and the formidable positions to the W., N.W., S. and S.E. were captured. Gen. Cadorna and his lieutenants, among whom the young Col. (later Gen.) Badoglio deserves especial mention, conducted the whole offensive with consummate skill, while the troops behaved with great gallantry. But there were other lines of defence E. and N.E. of Gorizia still in enemy hands, and there were not enough reserves to complete the action. The victory, however, revived public confidence. Italy now decided to participate in the expedition to Macedonia, where a mixed force of French, British, Serbs and Russians had been fighting in very difficult conditions for nearly a year. The Italian Supreme Command was not very favourable to such a dispersion of forces. But the Government thought that Italy should be represented. On Aug. 11 the first detachments, commanded by Gen. Petitti di Roreto, landed at Salonika; the expeditionary force eventually reached the total of 55,000 men, and was commanded from June 1917 by Gen. Mombelli. After taking part in the operations for the capture of Monastir (Nov. 1916), it was entrusted with one of the most dangerous sectors of the whole front. The Italian force in Albania, commanded by Gen. Ferrero, extended its occupation northward to the banks of the Voyusa in Aug. 1916, and then eastward, so that by the end of the year contact with the French army of the east had been established at Ersek. In June 1917 Gen. Ferrero at Argyrokastro proclaimed an Italian protectorate over Albania.

*Occupation of Gorizia.*

On Aug. 1916 Italy declared war against Germany. Many reasons have been assigned for the delay in taking this decision. Germany had no reason to declare war against Italy, and in fact she always hoped that at the future peace conference she would have in Italy, if not a friend, at least a friendly enemy among the Entente Powers. The Italian Government believed that, while public opinion fully realised the necessity for war with Austria, it did not see that Germany was the predominant partner in the hostile coalition, and that, as Italian forces were not in direct contact with those of Germany, except for a few detachments in the Trentino at the beginning of the war, there was no need to precipitate matters. In view of later events, and especially of the Allies' attitude towards Italy, the delayed declaration of war is now generally regarded as a mistake. The immediate cause of the declaration of Aug. 27 1916 was the assistance afforded by Germany to Austria in the recent operations and the seizure of Italian property by the German Government. On the same day Rumania declared war against Austria. The Italian military attaché in the former country, alone of the Allied representatives, had deprecated Rumanian intervention at that moment and disapproved of the plan of invading Transylvania while neglecting the Bulgarian front. The course of events was to prove his judgment only too accurate. In Jan. 1917 a conference of Allied premiers and commanders-in-chief met in Rome. Gen Cadorna, supported by Mr. Lloyd George, advocated an inter-Allied offensive on the Austrian front. But the French view that the western front alone was decisive prevailed. In April 1917 the British, French and Italian premiers and foreign ministers met at St. Jean de Maurienne, in Savoy, to discuss the future settlement of the Eastern problem. The meeting was the result of Baron Sonnino's insistence that the previous agreements between Britain, France and Russia concerning the same questions, and especially the fate of Constantinople and Asia Minor, were invalid as Italy was not a party to them. At St. Jean it was agreed that, in a future partition of Asia Minor, Smyrna was to be assigned to Italy, an undertaking subsequently broken.

*War against Germany.*

During the autumn of 1916, and again in the spring and summer of 1917, operations on the Carso-Isonzo front were carried out. Many thousands of prisoners were captured and some important positions conquered, especially on the Bainsitsa plateau. But no decisive victory was achieved, and the losses were terrible. What the Italian public only half realized, and that of the other Allied countries hardly at all, was that by these frightfully costly operations the Italian army was pinning down Austria's best troops—and after the Russian revolution practically all her troops—and preventing her from sending any reënforcements to the Germans on the western front.

It now became known that the Austrians, free of all danger on the Russian side, and aided by several German divisions and by the advice of Marshal von Ludendorff, were preparing an offensive on a large scale against Italy. Their preparations were not limited to the accumulation of reserves and artillery, but comprised an active and subtle propaganda among the Italian troops and, above all, in the interior of the country. The protracted struggle, the slow progress achieved, the serious defeats on many Allied fronts, the fearful losses, the grave privations of the civil population and, above all, the collapse of Russia, had accentuated the sense of depression which had begun to be felt in Italy more than a year before. Among the troops themselves the discomfort of life in the trenches, as well as the constant danger, the too-long periods at the front which each unit had to undergo, and the absence or inadequacy of the arrangements for providing amusements in the rest camps, began to react on the men who had fought for over two years. The more extreme Socialists were not slow to profit by this state of feeling; some of them were no doubt in the enemy's pay, others hoped to reëstablish their influence over the masses by provoking a military mutiny which would bring about peace, and all were influenced by the example of the Russian revolution and by the prospects of unlimited plunder which a similar movement in Italy would offer. An immense number of people, both civilians and soldiers, were simply war-weary, and there were other influences at work besides that of the Socialists. A "defeatist" campaign had already been started in Giolitti's organ *La Stampa* of Turin. The Clericals, who had never approved of the war, were even suggesting that peace might be obtained by agreement, and the Pope's Encyclical about the "useless carnage" made a considerable impression, although it must be added that many individual Catholics, including nearly all the army chaplains,

*Anti-War Agitation, 1917.*

had done their duty nobly. The German "peace offensive," and a speech by the Socialist deputy Treves, in which he promised that in the following winter no one should be in the trenches, all served to accentuate the state of mind which made Caporetto possible. A minor cause was the revolutionary strike in Turin in Aug. 1917. The pretext of the rioting was that on a certain day the city's bread supply had failed. The men who promoted the trouble were very highly paid workmen in the munition and motor factories, who had not a shadow of a grievance, but merely wished to imitate the Russian Bolshevists; German and Austrian money was probably not unconnected with the affair. The authorities repressed the rising with considerable energy and several of the rioters were killed or wounded. Many of those implicated were punished by being deprived of their exemption from service in the army and sent to the front, where they at once initiated a revolutionary propaganda among the other troops. Many of these men were incorporated in the brigades which afterwards collapsed at Caporetto, while others, employed in the motor transport service, were able to spread their suggestions throughout many units.

There had been signs of unrest and of a diminished military spirit among certain regiments, notably in the fighting on the Monte Ortigara on the Asiago plateau (June 1917), and in the operations against the Hermada on the road to Trieste in Aug., which, after a successful beginning, had been held up owing to the failure of certain units. This state of things had certainly not escaped Gen. Cadorna, but, in spite of his warnings, the Government, and in particular Sig. Orlando, the Minister of the Interior, had failed to pay attention to them or to take any adequate measures against the Bolshevist, defeatist and pacifist propaganda. Papers like the *Avanti* were not only published freely with only the mildest censorship, but were even allowed to reach the troops at the front.

The enemy offensive began on Oct. 23 1917, at Caporetto on the upper Isonzo. The objective had been not only to drive the Italians out of Austrian territory and to inflict a crushing defeat on the whole Italian army, but, as far as Austria was concerned, to reconquer Venetia for the Monarchy. The attack on Caporetto was followed immediately by another on the Asiago plateau. The results actually achieved were the breaking of the eastern front and the collapse of the whole of the Italian II. Army (Gen. Capello), which involved the retirement, albeit in order, of the III. (Duke of Aosta) from the Carso, and of the IV. (Gen. di Robilant) from the Cadore. The whole of the provinces of Udine and Belluno and parts of those of Venice, Treviso and Vicenza were occupied by the enemy. On the Asiago plateau, on Monte Grappa (between the Brenta and the Piave) and along the lower course of the Piave the Austro-Germans were held up, but no one knew if it would be possible to resist for long. The consequences of the disaster were grave indeed. The enemy had captured 300,000 prisoners, 2,500 guns (including most of the heavy artillery) and vast quantities of stores. Venice was now only 30 km. from the front and its fall at one time seemed inevitable, together with that of other important towns, manufacturing centres and rich agricultural districts. Depression and gloom spread throughout Italy, intensified by the throngs of refugees flying panic-stricken before the invaders, who murdered, raped, plundered and burnt their way onward (*see* CAPORETTO, BATTLE OF).[1]

***Caporetto.***

Germany and Austria were convinced that a knock-down blow like this would have left Italy prostrate, and they counted on a revolution leading to a separate peace, as was afterwards to take place in Russia at Brest Litovsk. Then all the enemy armies would be able to concentrate on the western front and obtain a decisive victory there before American help could arrive. Even in the Allied countries and in Italy herself it was thought impossible that after so crushing a disaster the army and people could recover. But the impossible happened. The feeling of dissatisfaction at the length of the war, the hope of peace by compromise, Germanophil sentiments, and the general sense of hopeless weariness gave way to the determination to resist at all costs. Everyone from the King to the poorest peasant realized that the new lines must be held. "*Di qui non passeranno*" ("Here they shall not pass") became the universal cry. The King's example was splendid. Since the beginning of the war he had always been at the front, constantly visiting the trenches and the most exposed positions, but without interfering in the conduct of military operations, although nominally commander-in-chief; he took only the same leave as any ordinary soldier, 15 days a year. But now he multiplied his efforts a thousandfold. His proclamation of Nov. 10 was a stirring trumpet call to the whole nation. "As neither My House nor My People, united in a single spirit, have ever wavered before danger, so even now we look adversity in the face undaunted. Citizens and soldiers, be a single army! All cowardice is treachery, all discord is treachery, all recrimination is treachery." Another man who did much to rouse the country was the poet D'Annunzio. He had given proof of wonderful courage in fighting, and he now influenced public opinion by the marvellous eloquence of his speeches and articles. Between Nov. 10 and 22 the defeated Italian army, which had pulled itself together, resisted on the Asiago-Grappa-Piave line, and the enemy, in spite of repeated attacks, failed to break through.

As soon as the extent of the Caporetto disaster was realized the Boselli Cabinet resigned (Oct. 26), and on the 30th Sig. Orlando succeeded in forming another, with himself as premier. Baron Sonnino remained Foreign Minister and the other portfolios were distributed as follows: Gen. Alfieri (War), Adml. Del Bono (Marine), Meda (Finance), Nitti (Treasury), Colosimo (Colonies), Dari (Public Works), Gen. Dallolio (Arms and Munitions), Sacchi (Justice), Fera (Post Office), Miliani (Agriculture), Ciuffelli (Trade and Industry), Bianchi (Transport), Bissolati (Pensions), Crespi (Supplies). Gen. Cadorna now ceased to command the army, and Gen. Diaz was appointed chief of the general staff in his place, with Gens. Badoglio and Giardino as assistant chiefs.

***Orlando Ministry.***

The Allies came forward generously to aid Italy in her dire need, and at once hurried fresh troops to the Italian front, amounting eventually to six British and five French divisions. Marshal Foch also visited the Supreme Command to assist with his valuable advice, but he endorsed all that Gen. Cadorna proposed almost without suggesting any change. The arrival of the Allied contingents exercised a most inspiriting moral effect on the Italian troops and public. But it must be remembered that no French or British contingent actually came into the fighting line until after the enemy had been definitely held up by Italian troops alone between Nov. 10 and 22. This fact had an important bearing on events yet to come, but is apt to be forgotten. On Nov. 5 the prime ministers of Italy, France and Britain and the Italian Ministers of War and Foreign Affairs met at Rapallo, where the permanent Inter-Allied Military Committee of Versailles was constituted. Gen. Cadorna was the first Italian representative on it, and remained there until, the Caporetto inquiry having been ordered, he was recalled.

A very serious problem which faced the new Government was the relief of the refugees from the invaded area. About 4·4% of Italy's territory had been occupied by the enemy and one-third of the inhabitants of those provinces had been able to escape and were scattered all over the country. The Government granted large sums for their assistance, and 35,000,000 lire was raised by public subscription. Their presence did much to strengthen the national spirit of resistance, and much valuable propaganda was carried out by the association of disabled soldiers (*mutilati di guerra*), the organization of which was largely due to the heroic Capt. Paulucci di Calboli, who, although hopelessly crippled, toured the country advocating resistance to the bitter end, until he died in consequence of his wounds. In the meanwhile the army was almost wholly reorganized, and the losses in artillery and other material more than made good in about four months' time, largely owing to the patriotic

[1] The report of the Royal Commission on the responsibilities of Germany and Austria for violations of international law, published in April 1921, contains a vast mass of evidence of the atrocious behaviour of the enemy in the united provinces.

enterprise of the Italian manufacturers and the organizing and technical genius of Gen. Dallolio. On Feb. 6 1918 Gen. Giardino was appointed to Versailles in the place of Gen. Cadorna, who was placed on the retired list, and on the 20th Gen. Alfieri resigned from the War Ministry, to which Gen. Zupelli returned. Valuable work was done by the American Red Cross, whose relief workers penetrated into every corner of Italy, and not only gave the most generous and efficient material assistance to the needy, but carried on a most vigorous political propaganda. The British Red Cross was also extremely active, especially at the front. At the same time both the Government and numerous Italian private committees set to work with energy to care for the comfort of the troops at the front and in the rest camps.

On Jan. 8 1918 President Wilson published his Peace programme containing the famous 14 points. Those which referred to Italy and the Adriatic question were of a nature to raise some doubts as to his policy. He spoke in fact of "rectifications of the Italian frontiers on clearly recognized national lines," a phrase which has no meaning where the population is mixed. Point 10 speaks of "autonomy" for the peoples of Austria-Hungary which might imply the maintenance of the Dual Monarchy; but as long as that Monarchy existed Italy could never hope to retain peacefully even Trieste. To Serbia he offered no more than a free outlet to the sea, which might have been obtained outside the Austro-Hungarian dominions; this point also implied an unspoken desire to preserve the Monarchy. In Italy, even among the most ardent interventionists, there were a few who did not wish for the total destruction of Austria-Hungary, but their desire was obviously incompatible with the realization of Italian aspirations.

*Italy and the 14 Points.*

Between April 8 and 10 the congress of nationalities oppressed by Austria-Hungary was held in Rome, and, although organized by a private committee, its delegates were received on the 11th by the premier, to whom they presented the so-called "Pact of Rome." Sig. Orlando had previously received in private the Yugoslav delegation to the Congress headed by M. Trumbich. The Pact of Rome, if carried out, meant the death-knell of the Dual Monarchy, inasmuch as it provided that each of the peoples subjected wholly or partly to Austro-Hungarian rule "proclaim its right to constitute its nationality and state unity and to complete it and attain full political and economic independence." The Italian and Yugoslav delegates recognized further that "the unity and independence of the Yugoslav nation are a vital interest for Italy, as the completion of Italian unity is a vital interest of the Yugoslav nation." They also agreed "to settle amicably the various territorial controversies on the basis of the principle of nationality and of the right of self-determination of peoples, and so as to avoid causing prejudice to the vital interests of the nations, which will be defined at the moment of making peace." Guarantees for the maintenance of their language, culture and moral and economic interests were promised to the racial minorities which might be included in each state. This agreement was an earnest of mutual good-will and the result of the tendencies of Bissolati and certain political men and writers who wished Italy to assume the leadership of the movement for the liberation of Austria-Hungary's subject peoples. But it really had no binding force, and it failed to offer a definite solution for the practical territorial problems which were destined later to assume so acute a character. The Nationalists claimed that the attitude of certain Italian representatives, who seemed prepared to give up Dalmatia, was responsible for the future *intransigeance* of the Yugoslavs.[1] At the same time the Yugoslav propagandists were conducting an active campaign to induce Britain and France to go back on the territorial agreements with Italy contained in the Pact of London, and they tried to enlist the support of the United States, which was not a party to that convention. In Sept. 1918 they actually proposed that, if Italy remained obdurate, Britain, France and the United States should force her to give way by cutting off her supplies of food and coal. It need hardly be said that this suggestion was not accepted by the Allies.

*Pact of Rome.*

Italy had already sent a number of territorial troops to France to form labour corps (about 90,000 in all). But now, in view of the very serious situation on the French front caused by the successful German offensive of March and April, and as a return for the assistance of Allied forces on the Italian front, it was decided to send an Italian fighting force to the western front, consisting of an army corps under Gen. Albricci. The announcement was made in the Chamber on April 18. In May there were certain Cabinet changes: Gen. Dallolio left the Munitions Ministry, and Senator Villa succeeded Sig. Bianchi at that of Transport, and on the 22nd Sig. Crespi was appointed to the newly created Ministry of Supply. On the 24th the third anniversary of Italy's declaration of war was celebrated in Rome, and the Prince of Wales took part in the ceremony.

After the great German offensive in France the Supreme Command received information that another Austrian offensive on the Italian front was in preparation. Although the spirit of the army and of the country as a whole was much higher than it had been before Caporetto, and it was generally believed that the enemy would be ultimately held up, it was feared that the enemy push would result in at least a temporary occupation of more Italian territory, containing rich industrial and agricultural areas which the country could not afford to lose. Fortunately the reorganized intelligence service was able to obtain full details of the enemy's plans in good time. This was partly due also to the Italian and Allied air forces, which had now acquired a complete mastery of the air on the Italian front, and to some extent to the work of propaganda carried out among the Austrian troops belonging to the oppressed nationalities. Among the Austrian prisoners captured, those of Czechoslovak, Rumanian and Polish nationality were formed into special units to serve at the front—the Czechoslovaks eventually constituted a division which took part in the fighting. Negotiations were also opened with a view to raising a Yugoslav force, but the plan failed. On June 15 1918, the Austrian offensive was launched on the Asiago plateau and on the Piave-Grappa front, and on the 23rd, after eight days' desperate fighting, the Austrians were completely driven back to their old positions, defeated and in disorder. This victory, in which the Anglo-French divisions had an important share, produced a general sense of relief.

*Defence on the Piave.*

The internal economic situation was difficult enough, but the public were ready to support all necessary privations. Bread, rice, macaroni paste, meat, sugar and many other food-stuffs were strictly rationed. The bread ration was reduced to 250 grammes per day per head, meat could be obtained only twice a week, and the manufacture of cakes and sweets was prohibited. Coal, which had risen enormously in price, was so scarce that the railway service for passengers had to be greatly curtailed on all lines. The size of newspapers was strictly limited so as to avoid wastage of paper. On the other hand, war industries assumed an enormous development, and the whole country became one huge arsenal, in spite of the fact that practically all the raw material had to be imported. Some mines, however, such as the iron-mines of the Val d'Aosta and several lignite-mines, which had remained idle for many years because it did not pay to run them, were now reopened and proved valuable war assets. The shipping losses were very serious, as the enemy submarines were particularly active in the Mediterranean and Adriatic, and by the end of the war Italy had lost just over half of her mercantile tonnage. This, together with the losses of British and other Allied shipping, enhanced the supply difficulty.

*Material Privation.*

Italy had now contingents on five fronts outside Italy—France, Albania, Macedonia, Palestine (since June 1917) and Libya. Before the war ended other detachments were to be sent to the Murman coast and to East Siberia. The Albanian force had not taken part in important operations since the end of 1916, but in the spring and summer of 1918 it came in for a good deal of fighting and extended the occupied territory considerably, in

[1] See the whole correspondence on the subject in *La Vita Italiana*, July–Aug. 1919, p. 120.

cooperation with the left wing of the French Armée d'Orient. After the occupation of Fieri and Berat, Gen. Ferrero's corps suffered a setback owing to the enemy's strong reënforcements, while his own effectives had been greatly depleted by fever, but it subsequently contributed to the success of the Macedonian offensive in September. In the latter operation Gen. Mombelli's contingent played a useful part. During the summer of 1918 preparations were being made for an Italian offensive on the Asiago plateau and in the Pasubio sector. But a vaster general offensive was also being prepared with the object of completely breaking the Austrian front. Events in France rendered any help to Austria from Germany improbable, while the surrender of Bulgaria constituted a new menace to the Dual Monarchy from the south-east. The army under Gen. Diaz comprised 51 Italian, 3 British, 2 French and one Czechoslovak divisions and one U. S. regiment. The attacking force consisted of 22 divisions divided into four armies, of whom one was commanded by Gen. the Earl of Cavan and another by the French Gen. Graziani; the two Italian army commanders were Gens. Caviglia and Giardino. The total enemy forces amounted to 73½ divisions, but they were inferior in artillery. The offensive known as the battle of Vittorio Veneto began on Oct. 24—a year and a day after the beginning of the Caporetto disaster. By Nov. 3, "what had been one of the most powerful armies in the world," as Gen. Diaz's victory communiqué states, "was annihilated." Some 600,000 prisoners, 7,000 guns and an immense quantity of material of all kinds were captured—the biggest haul of the whole war. The same day, at Villa Giusti, near Padua, an armistice between the Italian and Austro-Hungarian armies was signed. By its terms the enemy troops were to evacuate not only all Italian territory, but also all the territory assigned to Italy by the Treaty of London, and all Italian prisoners were to be liberated without reciprocity. At the moment it was signed the Italian troops were well beyond the old frontier in the western and central sectors of the front; Rovereto, Trento and the Val Sugana were occupied; and a column, descending the Val di Sole, was rapidly approaching Bozen. The enemy had also been driven out of a large part of the province of Belluno and most of the Friuli, while the city of Trieste had been occupied by troops under Gen. Petitti di Roerto transported by sea from Venice. The armistice went into force on the 4th, and on that day Cividale, Cervignano, Grado, Aquileia and Gorizia were reoccupied, and detachments landed at Monfalcone, various Istrian ports, Zara and on the islands of Lussin, Lagosta, Maleda and Curzola. There had been at first no intention of occupying Fiume, but it was done at the urgent appeal of the inhabitants, who were in fear of violence at the hands of the Croat bands.

*Vittorio Veneto.*

Meanwhile the Armistice of Nov. 11 with Germany was being concluded in France, as the result of events there, to which the victory of Vittorio Veneto had been an important contribution. For Bavaria was now open to the Italian armies. The first difficulty with which Italy was confronted immediately after her armistice with Austria was the handling of the enormous and unexpected number of enemy prisoners, to which were added the very numerous Italian prisoners who had been suddenly set free, or had freed themselves, without any arrangements for their food or transport; a considerable number who had been employed in Hungary, Rumania, Bulgaria and South Russia came pouring down into Macedonia, taxing to the uttermost the very limited resources of Gen. Mombelli's force. It was also urgently necessary to provide food, seed corn, cattle and clothing for the inhabitants of the liberated territories, whom the Austrians had plundered of everything. The problem of the prisoners was rapidly and efficiently handled, and in a comparatively short time the Italian prisoners were repatriated, although not a few of them, especially those in the Balkans, died of starvation and exhaustion on the way home. The question of the *terre liberate* proved far more serious; a special ministry was created for it, but in 1921 much still then remained to be done before those provinces could be restored to normal conditions.

*The Armistice.*

After Vittorio Veneto the Italian troops occupied the whole territory assigned to Italy by the Pact of London, and also certain other points beyond the line for the maintenance of order. Troops landed at Pirano and Muggia on Nov. 5, and a naval division entered Pola harbour the same day; Bozen in Tirol and Sebenico in Dalmatia were occupied on the 6th, and on the 10th the northernmost limit of the line arranged with Austria, the Brenner pass, was reached. The Duke of Aosta, commanding the III. Army, entered Trieste, where he established his H.Q., and on the same day a detachment under Gen. di San Marzano, together with a U.S. battalion, entered Fiume. On the 22nd the greater part of the former Austro-Hungarian mercantile fleet, which had taken shelter in the Prokljan lagoon near Sebenico, was taken over by Italian warships. Innsbruck and Landeck, at the request of the local authorities, were occupied on the 23rd for the maintenance of order, while on the 24th Italian patrols reached the high peaks of the Vetta d'Italia and the Pizzo dei Tre Signori, where they planted the Italian flag. The final settlement of Italy's new frontiers was of course a matter for the Peace Conference to decide.

*Occupation of Italia irredenta.*

The extremely heavy losses suffered by Italy in the war materially influenced public opinion in the country during the discussion of the peace terms, for it was generally felt that in the other Allied countries these losses were not adequately appreciated, neither in their absolute nor in their relative importance. With a total pop. of about 38,000,000 inhabitants (including the African colonies) Italy had mobilized 26 classes, or 5,615,000 men. Her losses in men were 496,921 killed (of whom 15,500 were officers) and 949,576 wounded (slightly wounded not included); of these 219,145 remained permanently disabled. The killed alone represent 1·3% of the population. The fact that Italy entered the war 10 months later than the other Powers makes her percentage of losses still more significant.

*Italian Losses.*

Italy's territorial claims had been set forth in the Pact of London, although certain Nationalist elements aspired to somewhat wider lands. The reasons for Italy's aspirations, as stated in the memorandum presented by the Italian Delegation to the Paris Conference on Feb. 7 1919, may be summarized as follows:—

*Italy's Territorial Claims.*

1. *The Trentino.*—This was a purely Italian province, whose inhabitants had always demanded union with Italy; on this point there was no controversy.

2. *The Alto Adige.*—The upper valleys of the Adige and its affluents as far as the Brenner were necessary for Italy's strategic security, and although they contained a German pop. of 180,000, it would be very difficult to find a possible geographical frontier south of the Brenner. This was one of the cases in which geographical considerations prevailed over purely ethnical ones.

3. *The Venezia Giulia.*—This territory comprised the city and district of Trieste, Gorizia-Gradisca, Istria and certain adjoining districts of Carinthia and Carniola. The total pop. was 893,000; according to Austrian statistics 48% were Italian, 32% Slovenes and 20% Croats, but these figures were, as is well known, doctored to make the Italians appear less numerous, while the Slav element had been largely increased in recent times by the importation of numbers of Slovene officials and workmen for the Government services, railways and State industries, always with the object of reducing the Italian percentage. On the other hand, the numerous Italian citizens permanently settled in the Venezia Giulia, although included in the total population, did not affect the Italian official percentage, being aliens, although they would affect it under Italian rule; if they were included the total of Italians would be 482,000 to 411,000 Slavs. Furthermore, even under Austrian rule, 70% of the total population lived in communes administered by Italian councils.

4. *Dalmatia.*—In this province the majority of the population was Slav. According to Austrian statistics, out of a total of 645,000 inhabitants only 18,000, or 3%, were Italians. According to Italian statistics the proportion of Italians amounted to 10% of the total. All the Dalmatian deputies to the Reichsrat were Slavs, and so were all the communes except Zara. But in 1861 the Diet comprised 30 Italians and 13 Slavs, and in 1869 seven Reichsrat deputies were Italians and two Slavs. The whole civilization, traditions, manners and customs of Dalmatia were undoubtedly Italian rather than Slav, and until after 1866, when Austria inaugurated her policy of fomenting hatred between the two races and of backing up the Slavs, Italians and Slavs had lived amicably together. Of this province, whose total area was 12,385 sq. km., Italy, by the Pact

enterprise of the Italian manufacturers and the organizing and technical genius of Gen. Dallolio. On Feb. 6 1918 Gen. Giardino was appointed to Versailles in the place of Gen. Cadorna, who was placed on the retired list, and on the 20th Gen. Alfieri resigned from the War Ministry, to which Gen. Zupelli returned. Valuable work was done by the American Red Cross, whose relief workers penetrated into every corner of Italy, and not only gave the most generous and efficient material assistance to the needy, but carried on a most vigorous political propaganda. The British Red Cross was also extremely active, especially at the front. At the same time both the Government and numerous Italian private committees set to work with energy to care for the comfort of the troops at the front and in the rest camps.

On Jan. 8 1918 President Wilson published his Peace programme containing the famous 14 points. Those which referred to Italy and the Adriatic question were of a nature to raise some doubts as to his policy. He spoke in fact of "rectifications of the Italian frontiers on clearly recognized national lines," a phrase which has no meaning where the population is mixed. Point 10 speaks of "autonomy" for the peoples of Austria-Hungary which might imply the maintenance of the Dual Monarchy; but as long as that Monarchy existed Italy could never hope to retain peacefully even Trieste. To Serbia he offered no more than a free outlet to the sea, which might have been obtained outside the Austro-Hungarian dominions; this point also implied an unspoken desire to preserve the Monarchy. In Italy, even among the most ardent interventionists, there were a few who did not wish for the total destruction of Austria-Hungary, but their desire was obviously incompatible with the realization of Italian aspirations.

*Italy and the 14 Points.*

Between April 8 and 10 the congress of nationalities oppressed by Austria-Hungary was held in Rome, and, although organized by a private committee, its delegates were received on the 11th by the premier, to whom they presented the so-called "Pact of Rome." Sig. Orlando had previously received in private the Yugoslav delegation to the Congress headed by M. Trumbich. The Pact of Rome, if carried out, meant the death-knell of the Dual Monarchy, inasmuch as it provided that each of the peoples subjected wholly or partly to Austro-Hungarian rule "proclaim its right to constitute its nationality and state unity and to complete it and attain full political and economic independence." The Italian and Yugoslav delegates recognized further that "the unity and independence of the Yugoslav nation are a vital interest for Italy, as the completion of Italian unity is a vital interest of the Yugoslav nation." They also agreed "to settle amicably the various territorial controversies on the basis of the principle of nationality and of the right of self-determination of peoples, and so as to avoid causing prejudice to the vital interests of the nations, which will be defined at the moment of making peace." Guarantees for the maintenance of their language, culture and moral and economic interests were promised to the racial minorities which might be included in each state. This agreement was an earnest of mutual good-will and the result of the tendencies of Bissolati and certain political men and writers who wished Italy to assume the leadership of the movement for the liberation of Austria-Hungary's subject peoples. But it really had no binding force, and it failed to offer a definite solution for the practical territorial problems which were destined later to assume so acute a character. The Nationalists claimed that the attitude of certain Italian representatives, who seemed prepared to give up Dalmatia, was responsible for the future *intransigeance* of the Yugoslavs.[1] At the same time the Yugoslav propagandists were conducting an active campaign to induce Britain and France to go back on the territorial agreements with Italy contained in the Pact of London, and they tried to enlist the support of the United States, which was not a party to that convention. In Sept. 1918 they actually proposed that, if Italy remained obdurate, Britain, France and the United States should force her to give way by cutting off her supplies of food and coal. It need hardly be said that this suggestion was not accepted by the Allies.

*Pact of Rome.*

Italy had already sent a number of territorial troops to France to form labour corps (about 90,000 in all). But now, in view of the very serious situation on the French front caused by the successful German offensive of March and April, and as a return for the assistance of Allied forces on the Italian front, it was decided to send an Italian fighting force to the western front, consisting of an army corps under Gen. The Albanian force had not taken part in important operations since the end of 1916, but in the spring and summer of 1918 it came in for a good deal of fighting and extended the occupied territory considerably, in

[1] See the whole correspondence on the subject in *La Vita Italiana*, July–Aug. 1919, p. 120.

Hungarian units *en bloc* and even calling up recruits in the new territories. There was also a state of anarchy in certain Austrian and Slav districts along the Armistice line, while the Italian forces in the Balkans had to be kept up to strength for the occupation of all Albania, now that the Austrian forces had left, to garrison Bulgaria and to provide contingents for Constantinople and other points in European Turkey. The internal situation also required careful handling, as the Socialist and anarchist elements, now that the war régime and the censorship were relaxed, took advantage of the general weariness of the people to foment revolutionary agitations. The economic situation was serious. On Nov. 26 Sig. Nitti presented the budget statement for 1917–8, which showed a revenue of 19,496 millions (of which 12,000 millions were borrowed) and an expenditure of 25,339 millions, leaving a deficit of 6,271 millions. The Cabinet obtained a vote of confidence from the Chamber on the 27th (325 to 33), after which Sig. Orlando and Baron Sonnino left for London for a series of preliminary meetings in view of the coming Peace Conference. On Dec. 12 the first demobilization order was issued, and the classes from 1878 to 1884 were disbanded. Owing to a disagreement with his colleagues over foreign policy, and particularly over the questions of the Alto Adige and Dalmatia, Sig. Bissolati resigned from the Cabinet. Sig. Dari, the Minister of Public Works, also resigned on account of ill-health, and was succeeded by Sig. Bonomi. On Jan. 1 1919, the state of war was declared at an end throughout Italy except in the Veneto. On the 3rd President Wilson arrived in Rome, and was received with a frenzied enthusiasm as the man who had most contributed to bringing the war to an end. But the ministers who had occasion to discuss politics with him suspected that he was by no means too favourable to Italy's claims.

*Ministerial Crisis, 1919.*

The ministerial crisis which had been brewing since Bissolati's resignation came to a head on Jan. 18, and resulted in the resignation of Signori Sacchi, Nitti, Villa, Miliani and Gen. Zupelli from the ministries of Justice, Treasury, Transport, Agriculture and War; their portfolios were assumed by Signori Facta, Stringher, De Nava, Riccio and Gen. Caviglia, while the newly constituted ministry for the liberated territories was entrusted to Senator Fradeletto. The Italian delegation to the Peace Conference, which held its first meeting in Paris the same day, was composed of Sig. Orlando, Baron Sonnino, the ex-ministers Salandra and Barzilai and the ambassador Marquis Salvago-Raggi.

*The Peace Conference.*

The Italo-Yugoslav conflict soon broke out in an acute form. An initial mistake of the Italian delegation was their failure to protest against the presence of Herr Zolger, the ex-Austrian minister, among the Yugoslav delegates. On Feb. 17 the Yugoslav delegation in Paris proposed to refer all territorial disputes to the arbitration of President Wilson, but Baron Sonnino replied that Italy could not accept arbitration on a question for which she had fought for three years and lost half a million of her sons, and it must now be submitted to the Conference. The following day the Yugoslavs presented their territorial claims, which corresponded to the minimum mentioned above, plus Montenegro and North Albania. On the Armistice line frequent incidents occurred between Italian and Yugoslav troops, and the latter even expelled the Italian military mission from Laibach, where it had been sent to regulate through traffic to Czechoslovakia. As a result of the report of a special Inter-Allied Commission the Italian mission returned to Laibach. On Feb. 24 Italian officers were insulted by Croat roughs at Spalato. At Belgrade the Government refused to accept the credentials of the new Italian minister, Don Livio Borghese, because they were addressed to the King of Serbia and not to the King of the Serbs, Croats and Slovenes, Italy not having recognized the new state. The discussion of the Adriatic question at the Peace Conference was adjourned and the peace with Germany given precedence. The Italian delegation practically agreed to all the proposals of her Allies in this connection, and raised no objection to the division of Germany's colonies solely between France, Britain and Belgium, without asking for any concessions in return. For this the delegation was afterwards criticized in Italy, where bitter and sometimes extremely violent attacks on the Allies were made in a section of the press, for their supposed unfairness in support of the Yugoslav claims.

*The Adriatic Question.*

When the Adriatic question itself came up for discussion the Italian delegation maintained that the Pact of London assigned certain territories to Italy, and that on these there could be no controversy; Fiume, admittedly, was not comprised in them, but as the population had by an overwhelming majority demanded union with Italy, its wishes deserved every consideration. To facilitate a settlement Italy was disposed to agree to certain modifications of the Pact of London. The French and British Governments seemed at first inclined to agree to this view. But President Wilson insisted that the territories inhabited by a Yugoslav majority must be assigned to the Yugoslavs even if the Pact assigned them to Italy, and that Fiume must also be given to them because it was the best outlet for them on the coast, regardless of the wishes of the inhabitants. Matters had reached a deadlock by April 22, but conversations still continued apparently in a friendly tone, when suddenly, on the 23rd, Wilson published an appeal on his own account to the Italian people, over the head of their Government, in which he set forth his reasons for opposing Italy's claims. The arguments contained in the message were said to have been communicated privately to Orlando a few days previously, but the President had stated that he had no objection to further discussions, so that there was nothing to suggest this new move. The message caused widespread astonishment, as an unprecedented violation of the rules of correct diplomacy. Orlando at once declared that he must go to Rome to consult Parliament and the country.[1] On the 24th he left Paris, followed two days later by Sonnino and Salandra. There were enthusiastic demonstrations throughout Italy in favour of the Government and against Wilson, and the Fiume problem became now a question of national honour. On the 29th the premier recounted the story of the Fiume negotiations to the Chamber, which supported his policy by 382 votes to 40. The Government found support even in the Socialist camp and among the *rinunciatari*. Sig. Bissolati confirmed his conviction that Fiume must be Italian on ethnical grounds, and the labour organizations, in reply to appeals from the British Labour party and the French C.G.T. to uphold Wilson's policy, declared that they could not accept a one-sided Wilsonism, unbending towards Italy and accommodating where the interests of other Powers were concerned.

*Mr. Wilson's Bombshell.*

The poet D'Annunzio took up the question of Fiume and Dalmatia with his accustomed ardour, and the Nationalists urged the Government to annex both. But Orlando refrained from hasty action. The other Powers were very anxious that Italy should sign the Treaty with Germany, for, although it could have been signed without her, her absence would have strengthened

[1] Italy's attitude with regard to President Wilson's 14 points has often been misapprehended. When President Wilson originally asked the Allied Powers whether they were prepared to accept his 14 points and subsequent declarations of policy as a basis for an armistice and eventually for peace, their delegates (premiers and ministers for foreign affairs) met in Paris at the end of Oct. 1918 to concert a reply. At one of these meetings Sig. Orlando formally declared that he must make reservations as to point 9 concerning the future frontiers of Italy, as it was "liable to interpretations which Italy could not accept." Lloyd George and Clemenceau replied that the question concerning Italy did not arise, as the Armistice with Germany was the sole object of the discussion. Orlando accepted this statement, but at a subsequent meeting, on Nov. 1, at which experts and American representatives were also present, he repeated his reservations, saying that he wished to make the matter clear also in this plenary sitting. Again Lloyd George and Clemenceau replied, with some impatience this time, that the matter concerned Germany alone and not the frontiers with Austria. Orlando again accepted this declaration, adding that he would renew the exception at the proper time and place. When Orlando left the Peace Conference on April 24 1919, in consequence of Wilson's action, the press in Britain and America said that Italy had spoilt her case by accepting the 14 points. But the fact is that the above-mentioned reservations of Orlando, stated also in the presence of American delegates, although published in Italy and in a few foreign papers, were ignored by the great bulk of foreign public opinion.

the position of Germany. But Sig. Orlando failed to take advantage of this situation, and on May 5 returned to Paris, without having obtained those guarantees in favour of Italy's interests which the Italian public believed he had secured. On the contrary, on reaching Paris the delegation found its situation less favourable than when it had quitted the Conference. The German treaty was ready, and contained certain modifications concerning reparations, introduced during the absence of the Italian delegation, and against which Sig. Crespi, assistant delegate, had protested. A defensive alliance between France, Britain and the United States had also been concluded without Italy being asked to participate, and although she would probably have refused, the Italian public considered that want of consideration had been shown in not asking her. On the 7th the peace terms were presented to Germany by the combined delegations.

Discussions on the Adriatic question were now resumed. The British, French and U.S. ambassadors in Rome proposed that Fiume be placed under the League of Nations, but the scheme fell through owing to President Wilson's opposition to any solution which gave Italy any predominance, however slight, over Fiume. Mr. Nelson Page, the U.S. ambassador in Rome, went to Paris to impress on the President the violence of Italian feeling on the Fiume question, but he proved obdurate. Violent personal attacks against him were being made in the Italian press, often of a scurrilous nature and some of them penned by D'Annunzio. One of the French delegates, M. Tardieu, came forward on May 27 with yet another proposal: Fiume with a strip of territory to the W. was to form an independent state with a mixed administration, Zara, Sebenico and most of the islands to go to Italy, the rest of Dalmatia to Yugoslavia. The Italian delegation could not accept the scheme quite as it stood, but was ready to discuss it. At one moment it seemed as if an agreement had been reached, but Wilson and the Yugoslav delegates met again and both decided to reject it.

Sig. Orlando now returned to Rome to inform Parliament of the course of the negotiations, and was defeated by 259 votes to 78 (June 19). The Cabinet in consequence resigned. Sig. Nitti was entrusted with the formation of a new ministry, and he had accomplished the task by June 22 in the following manner: Nitti (Presidency and Interior), Tittoni (Foreign Office), Luigi Rossi (Colonies), Mortara (Justice), Tedesco (Finance), Schanzer (Treasury), Admi. Sechi (Marine), Gen. Albrici (War), Alfredo Baccelli (Education), Pantano (Public Works), Dante Ferraris (Industry), De Vito (Transport), Chimienti (Post Office), De Nava (Liberated Provinces). A new peace delegation was formed, without the premier, and composed of Senators Tittoni, Scialoja, Maggiorino Ferraris and Marconi, to whom was added later the Marquis Imperiali, ambassador in London. It left for Paris on June 28, the same day the Treaty of Peace with Germany was signed by Baron Sonnino and Marquis Imperiali.

During this agitated period of international politics, the internal situation in Italy was also grave. Prices rose rapidly after the Armistice, and there was a serious dearth of many goods, such as coal, wheat, meat and sugar. Government measures to meet these difficulties proved quite inadequate, and consisted in a series of regulations for limiting prices which merely made the goods disappear for a time and then reappear at higher prices: in selling bread below cost, which involved a huge deficit in the budget; in doles and subsidies which encouraged idleness, and in innumerable regulations which hampered trade and transport. The working-classes were enjoying very high wages, and squandering their earnings, but were discontented because prices had risen, largely in consequence of the rise in wages. War profiteers, on the other hand, were seen indulging in an orgy of extravagance and vulgar display. It was only the people with fixed incomes who were really hard hit by the rise of prices and of taxation, but everybody alike grumbled and was dissatisfied. The extreme Socialist leaders exploited this situation for their own purposes, and encouraged the working-classes in the belief that they had been made to fight in the war for the benefit of the capitalists, while it was now their right to obtain an ever-increasing share in the nation's wealth, with no corresponding obligation to work and produce. The example of Russia was made the most of, and by depicting the condition of the unhappy country as an earthly paradise they persuaded large masses of the people that if a similar régime were introduced into Italy everyone would be happy. Ex-neutralists in the political field also contributed to the general sense of discontent, by a persistent propaganda of "I told you so," claiming that they were right in opposing the war.

A new party now arose which was destined to play an important part in future political development—the Popular or Catholic party. There was already a Catholic group in the Chamber and many communes were run by Catholic administrations. But the Catholics were now absorbed into the wider *Partito popolare italiano*, whose constitution was announced in the *Osservatore Romano* on Jan. 20 1919. It rapidly developed its organization, under the leadership of the Sicilian priest Don Luigi Sturzo, who had set forth its general lines in his speech at Milan on Nov. 17 1918. The executive committee, of which Count Santacci was president, met in Rome, and on Jan. 18 1919 presented as its programme a series of far-reaching reforms of a Christian Socialist character, especially as regards the land question, so as to take the wind out of the sails of the Socialists. It advocated the breaking-up of the large estates with compensation to the landlords, collaboration between capital and labour in industry, freedom of religious education and as to divorce, and a patriotic foreign policy. It gained support chiefly in the Veneto and parts of Lombardy, and in general among the peasant class, largely through the activity and good organization of the Catholic cooperative societies and banks. It also included a great many persons of the middle-class and the aristocracy.

*Popular Catholic Party formed.*

The general consequence of this state of discontent was a series of strikes in every trade, including the public services, a repugnance for work, and a diminution of output. The extreme Socialists hoped to be able to bring about a real revolution of the Russian type, while even those members of the Socialist party who were too sensible to agree in this were too much afraid of losing popularity with the masses to speak out openly. During the war, funds had been received from Germany and Austria; now the wind had to be raised by blackmailing timorous shopkeepers endangered by riots, and by pillaging the shops of those who refused to be blackmailed when the riots occurred. Socialist orators were vigorous not only in denouncing the supposed sins of the bourgeoisie, but in warning them that it was no use struggling against the inevitable. On Dec. 22 1918 the Socialist party held a meeting at Bologna, and immediately afterwards the Postal Employees' Committee of Action threatened a strike which was only averted by the Government's promise of higher wages. Other strikes occurred during the winter and spring, and on April 20 there was a 24-hour strike in Rome because the authorities had forbidden a manifestation in favour of the Russian Bolshevists. A similar demonstration was held in Milan on the 23th, and a few persons were wounded in a scuffle. A shot fired by a Socialist against a patriotic procession near the offices of the *Avanti* resulted in the wrecking of the latter by the crowd. The G.C.L. ordered a protest strike throughout Italy, but it was carried out in only a few places, and in Rome ended in a great patriotic demonstration on the 17th. On May 4 a strike of the tramwaymen and secondary railwaymen began, involving 80,000 persons; it was the first of the strikes in the public services with which the Socialists hoped to disorganise the economic life of the country. A couple of days later the National Seamen's Federation, presided over by the fire-brand "Captain" Giulietti, held up an Italian steamer conveying munitions to British troops in Russia.

*Revolutionary strikes.*

In the domain of foreign affairs the Government had to deal with a complicated Oriental situation. In addition to the general provisions of the Pact of London for an Italian occupation of southern Anatolia, by the agreement of St. Jean de Maurienne (April 1917), Italy had been promised Smyrna and its district in the future repartition of Asiatic Turkey. But at the Paris Conference it became clear

*Policy in the Near East.*

that the other Allies were not anxious to fulfil this promise. British troops had occupied various points in northern and N.W. Asia Minor, and on March 29 a landing party from the Italian fleet occupied Adalia. When, after President Wilson's famous message, the Italian delegation left the Conference, in April 1919, the British, French and U.S. representatives reconsidered the whole question of Asia Minor, and while Mr. Lloyd George and M. Clemenceau hesitated to tear up the St. Jean de Maurienne agreement altogether, President Wilson forced the hands of his colleagues into deciding to send the Greeks to Smyrna under the belief that a massacre of Christians was imminent. Immediately after the Greek landing at Smyrna (May 15), Italian troops landed at Scala Nuova and other points in S.W. Anatolia; the Meander valley was to divide the Italian from the Greek zone of military occupation, but the exact delimitation was not yet defined and gave rise to various incidents. On the 24th an Italian battalion was sent to Konia. All Allied troops in Asia Minor, including Italians and Greeks, were under the orders of Gen. Milne, commanding the British forces at Constantinople (Army of the Black Sea). Other Italian forces were in the East. The Macedonian expeditionary force garrisoned Bulgaria until July 1919, while three battalions formed part of the Allied garrison in European Turkey. Italian policy in the East was dominated by the feeling that it was unwise to exasperate the Turks too much, and that peace could only be secured by a more conciliatory attitude, even towards the Nationalist movement organized by Mustafa Kemal Pasha in Asia Minor. At the same time Sig. Tittoni tried to conciliate Greece, and in July he concluded an agreement with M. Venizelos for the delimitation of the respective military zones in Asia Minor and providing that the Greeks should have a free hand in S. Albania. The agreement afterwards was rescinded and most of its clauses modified, but the provisions concerning Albania had an unfortunate reaction on Italo-Albanian relations. In the meanwhile Italian banks and business men showed considerable enterprise in the Near East; the steamers of the ex-Austrian Lloyd and other lines obtained practically the monopoly of the passenger traffic and a large share in the goods traffic between Europe and Constantinople and the Black Sea ports. The scheme to send an Italian expedition to the Caucasus, which had been suggested at the Peace Conference and practically accepted by Sig. Orlando, was abandoned when Sig. Nitti came into power. Various Italian commercial undertakings were, however, started in Transcaucasia, including the Italo-Caucasian bank at Tiflis and a concession for developing the coal-mines of Ochemchiri.

*D'Annunzio and Fiume.*

The Adriatic negotiations dragged on without reaching a conclusion. Fresh trouble broke out at Fiume, where the antagonism of the soldiers attached to the French base (mostly colonials) to the Italian inhabitants, and their open support of the Croat element, provoked reprisals and some French soldiers and Annamites were killed and several wounded (July 2 and 5). In consequence of these incidents the Peace Conference appointed a Commission of Inquiry, on which Gen. Di Robilant was the Italian representative. It advised the dissolution of the Fiume National Council, elections to be held under an Inter-Allied Commission, the disbanding of the Fiume volunteers, a considerable reduction of the Italian forces in the town, and the importation of British or U.S. police. These latter steps were in course of being taken, when D'Annunzio suddenly arrived (Sept. 12) from Ronchi, at the head of some Italian troops whom he had induced to follow him to Fiume in order to save it for Italy. Most of the Italian troops in Fiume and the crews of the warships in the port joined him also, and he became master of the town. The Allied troops then left. The effect of D'Annunzio's enterprise throughout Italy was astonishing. The premier stigmatized it in violent terms, established a blockade round the place, and practically appealed to the Socialists to back him up against D'Annunzio. But a large section of public opinion supported the latter. Volunteers from all parts of the country flocked to his standard, including Gen. Ceccherini, one of the bravest men in the army, and a number of other officers of the army and navy, Prof. Pantaleoni, many young men of the highest character as well as not a few adventurers. D'Annunzio's adventure became, in the eyes of a large section of public opinion, the symbol of Italian patriotism and idealism. But it placed Italy in an awkward international situation and intensified the suspicions of foreign Governments. The Yugoslavs made no move, but although D'Annunzio informed them that they were free to use the port of Fiume for their trade, they refused to do so.

*Revolution and Reaction.*

Riots against the ever-increasing high cost of living broke out in Italy in the summer. Though it was chiefly due to the inflated paper currency, high freights, scarcity of goods and the perpetual strikes, and only in a lesser degree to the greed and speculation of the shopkeepers and merchants, the populace attributed it wholly to the last-named cause. Troubles began at Forli on June 30, but were more serious in Florence on July 3, in Turin, Alessandria, Milan, Pisa, Genoa and Bari. Shops and markets were pillaged, much property destroyed, including precious food-stuffs; and agents of the *Camere del Lavoro* (organizations for promoting strikes and riots, camouflaged as labour exchanges) requisitioned food in the shops, warehouses and country estates, paying for them at rates below the market price. *Calmieri* (minimum prices) were imposed locally, at 40% or 50% of the previous prices, with the only result that the opportunity was taken for reselling at a large profit. The Government did nothing to stop these outbreaks, and the Socialist leaders concluded that the time was ripe for revolution. An international strike of protest against the hostile attitude of the bourgeois Governments towards the Soviets of Russia and Hungary was announced for July 20 and 21. Sig. D'Aragona, secretary of the G.C.L., tried to organize the movement, but the Labour parties of Britain and France, whose Governments still kept troops in Russia to fight the Bolshevists, refused to agree. In Italy, whose troops had been withdrawn from Russia, the working-classes seemed prepared to join, but a reaction was already at work among the masses as well as the bourgeoisie itself. The reign of terror which the Socialists had been trying to establish all over Italy was first countered by the Association of Combatants (ex-soldiers); citizens' committees were formed, and afterwards the *fasci di combattimento*, societies of energetic young men of all parties and classes who had fought in the war and organized themselves for patriotic objects and the maintenance of order. The result was that the Labour protest of July 20–21 was a failure. Work was suspended in most of the factories of N. Italy, and the tramwaymen in certain towns took a holiday, but the railwaymen worked as usual, and in many towns of the N. there was no strike and the whole of the S. was unaffected. There was no revolution and no rioting to speak of. This fiasco was due to the action of the bourgeoisie itself far more than to any official precautions.

After the July manifestation there were other strikes and riots in various parts of Italy, but not of a general or alarming character. Disorders at Trieste on Aug. 3 ended in a patriotic demonstration in which the offices of the Bolshevist organ *Il Lavoratore* were wrecked. There was also an agricultural strike for an eight-hour day affecting 80,000 persons in the districts of Novara, Vercelli, Pavia and the Lomellina. The Government as usual hardly took any action at all. Apparently Sig. Nitti's theory of the general state of disorder was that it was a form of madness consequent on the war, and that the only thing to be done was to let it work itself out.

Throughout all the strikes and disorders the troops and police behaved admirably. Sig. Nitti deserved credit in this connexion by his reorganization of the police; he increased the number of the excellent *carabinieri* to 60,000, and while abolishing the unsatisfactory *Guardie di Pubblica Sicurezza*, he created the *Agenti investigativi* of plain-clothes detectives (Aug. 14), and the corps of *Guardie Regie* under the orders of the Ministry of the Interior, comprising cavalry and machine-gun detachments (Oct. 2); the number of the latter was gradually brought up to 25,000. The premier's policy towards the army, on the other hand, was open to serious criticism. While huge increases of wages were being granted to civilian labour, the pay of military officers, even of high rank, was left miserably low; and when

officers were insulted and even murdered in the course of the riots the Government did nothing but order them to go about unarmed. A decree was issued by the War Minister, inspired by the premier, amnestying deserters (Sept. 2), and thereby placing them on the same footing as soldiers who had done their duty. The previous Cabinet, moreover, had instituted a carefully packed commission to inquire into the causes of the Caporetto disaster; and on July 24 it presented its report, apparently condoning the Socialist propaganda and attributing the whole blame to certain generals who were in bad odour with the Government. In consequence of its findings, Gens. Cadorna, Porro, Capello (commanding the II. Army), and Cavaciocchi (commanding the IV. Corps) were placed on the retired list, Montuori, Bongiovanni and Boccacci at the disposal of the Ministry without commands, while Gen. Brusati, who had been exonerated after the Trentino offensive of 1916, was recalled into service. The report intensified public depression, by recalling only the more painful aspects of Italy's military effort.

On Sept. 10 the Peace Treaty with Austria was signed at St. Germain-en-Laye. Italy thereby acquired the frontiers assigned to her by the Pact of London, as far as the Trentino and Alto Adige were concerned, with the addition of the Sexten valley and the Tarvis district. Thus were the roads of invasion from the N. closed. The new territory was rich in water-power and forests, and contained some good agricultural and fruit-bearing land, a few mines and many fine mountain resorts. The population comprised 383,367 Italians[1] of a sturdy mountain stock and 235,165 Germans. But although the latter showed no Italian sympathies, the Government treated them with liberality and showed every intention of granting the widest freedom for their language and culture. But the public was so obsessed by the unsatisfactory state of the Adriatic question that the Austrian Peace, which gave Italy such considerable material and moral advantages, passed almost unnoticed. On Nov. 12 Senator Tittoni returned from Paris and resigned both from the Peace Delegation and the Foreign Office, on account of his bad health, and was appointed president of the Senate and Italian representative on the League of Nations Council. He was succeeded at the consulate by Senator Scialoja, the eminent Neapolitan jurist. It was under increasingly onerous economic conditions throughout the country that the elections of Nov. 1919 were held. Wheat had risen from $1.01 per 60 lb. in 1913–4 to $2.40 in 1919, and the value of the dollar had risen from 5.20 lire to 13.07. Freights had risen from 3s. per 480 lb. to 17s., with the pound more than doubled in value. The Government made the wheat trade a State monopoly; it tried to reduce consumption by mixing wheat-flour with that of cheaper cereals and rationing the supply. It requisitioned home-grown wheat at a price below the cost of production, but as it had to pay for imported wheat (with Russia and Rumania no longer available as sources of supply) at the market price, it could only sell it cheap by paying the difference; thus wheat-growing was discouraged at home and the State budget involved in a deficit of many milliards. The war had also caused a serious disorganization of transport. Locomotives, trucks and permanent way had been over-used, coal had risen enormously in price and could not be obtained in sufficient quantities nor of the best quality, so that the train service had been reduced, and the staff, while increasing in numbers from 134,000 in 1914 to 180,000 in 1919, had become less efficient and more undisciplined. Thefts of goods on the railways were increasingly frequent, and the innumerable restrictions on trade made life ever harder. By the new electoral law the country was divided into 54 constituencies, each returning from 5 to 20 members, and the elector voted not for an individual but for a list. The object of the system was to prevent elections from being based on purely local interests, but its weak point was that the voter could not scratch any name he did not like, but had to swallow the list as a whole. He could add a preferential vote to any particular candidate, and this gave rise to bitter rivalry among candidates in the same list. The consequence was that a very large percentage of the voters, mostly in the constitutional parties, abstained.

*Peace Treaty with Austria.*

*Elections of 1919.*

The two parties which presented themselves to the polls with a complete organization and a definite programme were the Socialists and Catholics. The former held a Congress in Bologna on Oct. 5–8, where they decided to participate in the coming elections with a revolutionary "maximalist" programme, with the object of abolishing capitalism and instituting a Socialist republic on the Russian model; only a small section led by Prof. Bardiga declared for abstention from the polls and for a revolution by armed risings. The Congress also adhered to the Moscow Third International. The Popular or Catholic party had made rapid progress, and on June 14 1919 a general Congress had been held at Bologna where a resolution in favour of going to the country with its own candidates, instead of cooperating with the other parties, was voted by a large majority. But during its first year of existence a more extreme tendency appeared within its ranks, headed by Sig. Miglioli, whose principles and tactics differed but little from those of the ultra Socialists; the extremists were particularly active among the peasantry, especially in the province of Treviso, parts of Lombardy and Tuscany, and their agitations and excessive demands often led to strikes and riots, in spite of the disapproval of the bishops and even of the Vatican. The various constitutional groups were split up without a programme; the Government was discredited and unpopular; the foreign situation of the country in a hopeless tangle, and everyone more or less discontented.

The elections were held on Nov. 16 1919, without serious incidents. The result was that the Official, or Maximalist, Socialists elected 156 members, and the Catholics 101. These were the two most successful parties; the Republicans were reduced to 8 or 9, while the *Combattenti* won some 30 seats. The Socialist members were by no means all authentic "proletarians"; 50 of them were lawyers, a large proportion "organisers," and only 19 more or less genuine working men. Quite a number were wealthy, and at least eight were millionaires.

On the opening of Parliament (Dec. 1), the King was greeted with enthusiasm by the majority, but the Socialist deputies shouted "Long live Socialism!" and left the Chamber. As a protest against this offence to the King, popular demonstrations were held outside Montecitorio, and a number of Socialist members were attacked and injured. The leaders of the party ordered a general strike throughout Italy as a protest: work was stopped in many towns, and there were riots in some places, which often took the form of assaults by bands of hooligans on isolated officers. At Mantua on Dec. 3 a crowd of anarchists succeeded for a few hours in making themselves masters of the town: they burnt the prison and let loose 200 criminals, pillaged a number of shops and committed several murders. The next day, reinforcements having arrived, order was restored. The strike ended in most places on the 4th, but in a few cases continued until the 4th or 5th. Sig. Nitti's position was certainly not strengthened by the result of the elections. The Socialists rejected his advances while taking his gifts, and constituted a noisy and violent opposition; the Catholics, although bitterly hostile to the Socialists, could not be relied upon to support the Cabinet, as they had their own policy to further; the mass of Constitutionalists were divided into many groups, some of which, such as those of Nationalist sympathies, were in opposition, while others were but lukewarm supporters. The Ministry remained in office because there was no other combination ready to succeed it.

*Socialist Agitation.*

On the Adriatic coast, meanwhile, further incidents were occurring: the French base was withdrawn from Fiume (Oct. 9), and the Yugoslav mob at Spalato continued to make attack the Italian inhabitants under the eyes of the American admiral. A series of fresh proposals to unravel the Adriatic tangle were made. Early in Oct. San. Tittoni had suggested to D'Annunzio's legion that, by the Italian regular troops would occupy the town, pending the settlement of the problem at Paris. Italy undertaking not

[1] Austrian census statistics.

to permit Fiume's annexation to Yugoslavia, but D'Annunzio refused to agree. On Oct. 27 the U.S. Government presented a new scheme whereby Fiume was to be made into an independent state, under the League of Nations, but comprising not only the ancient *corpus separatum*, but also a large part of Istria. Since the Slav population would then have swamped the Italians of the town, the plan was not acceptable to Italy nor to the Fiumani. President Wilson on Nov. 13 followed this with a stiff message to the Italian Government, in which he insisted on the question being settled on the lines of the American scheme. On Dec. 9, however, the British, French and U.S. Governments presented a memorandum to Senator Scialoja, proposing certain modifications—the town of Fiume to enjoy full autonomy (not independence) within the proposed buffer state, but without territorial contiguity with Italy (as the latter demanded), and Zara to choose which state should represent it diplomatically. The tone of this communication was regarded in Italy as unfriendly, and Senator Scialoja, in his speech in the Chamber on Dec. 21, set forth the state of the negotiations and the reasons why the various Allied proposals were inacceptable to Italy—above all the fact that they failed to provide for the security of the Italian frontier and coast. M. Clemenceau's speech of the 24th was considered offensive to Italy and also inaccurate, as he spoke of Fiume having been "promised" by Italy to Croatia, whereas the Pact of London merely contained a declaration on that point and not a bilateral agreement, as Croatia was not a party to it and indeed did not then exist as a separate state. To this Sig. Scialoja replied on the 29th that Italy had only asked for the execution of the Pact of London, that the Fiumani themselves had asked to be annexed to Italy, and that the Allies seemed to ignore Italy's readiness to compromise on Dalmatia: he would enter into direct negotiations with the Yugoslavs, provided the latter were acting solely on their own account and were not guaranteed a minimum by other Powers.

After trying again, but without success, to induce D'Annunzio to leave Fiume, the Italian Government presented a new project on Jan. 6 1920, on the following lines:—Independence within the buffer state for the town of Fiume, the latter being connected by a strip of territory with Italy, and the S.W. frontier of the buffer state corresponding to that fixed by the Pact of London; Cherso and Lagosta to be assigned to Italy, as well as the islands which Wilson was ready to cede to her; the coast from Fiume to the Voyusa to be neutralized, and the Italian element in Dalmatia guaranteed adequately. On Jan. 9 the British and French Governments (the U.S. having now withdrawn from the Allied Supreme Council) stated that they were ready to apply the Pact of London, or, if Italy considered it no longer applicable under present conditions, the Memorandum of Dec. 9, with certain modifications suggested by the Italian note of Jan. 6. The following day the Italian Government replied to the Memorandum of Dec. 9, objecting above all to the proposed Istrian frontier, which would only be 18 km. from Trieste and 22 from the defences of Pola. On Jan. 14 the following agreement was arrived at in London between Sig. Nitti, Mr. Lloyd George, and M. Clemenceau:—Fiume under Italian sovereignty, but Susak to Yugoslavia, the port and railway under the League of Nations; Lussin, Lissa and Pelagosa to Italy but demilitarized; Zara independent, but free to choose its own diplomatic representation; Albania under an Italian mandate but certain districts ceded to Greece and Yugoslavia.

The Yugoslav delegation objected to the whole scheme, and even Nitti's offer to renounce Italian sovereignty over Fiume, which would remain quite independent, failed to satisfy them, and they referred the matter to the Belgrade Government. The latter insisted on the Wilson line as the only possible frontier for Istria, and objected to Fiume and Zara being free to choose their diplomatic representation. On Jan. 20 the U.S. Government protested against any decision being taken without their having a voice in it, to this Britain and France replied on the 23rd that they had come to an agreement with Italy on the basis of the Nitti compromise, but that if the latter were not accepted, the Pact of London, which satisfied no one, would be the only alternative. The Yugoslav Government objected to having to choose between these two proposals, and professed itself unacquainted with the contents of the Pact of London; this was now communicated to it officially. President Wilson, on his side, replied to the Allies on Feb. 10 (in a note communicated on the 13th) that their new proposals of Jan. 14 contained several unjust modifications in favour of Italy as compared with the Memorandum of Dec. 9 to which he had agreed, while he rejected the Pact of London altogether; unless the Memorandum of Dec. 9 was accepted he would seriously consider the withdrawal of the Versailles treaty now before the American Senate. There followed a further exchange of correspondence and notes between Italy, France, Britain, Yugoslavia and President Wilson, without any solution being arrived at.

In the domestic situation, one of the first consequences of the Socialist successes at the polls in Nov. 1919 was an increase of indiscipline and revolutionary spirit among the railwaymen and postal employees. On Jan. 13 1920, the postal workers went on strike. Citizen committees, however, were formed who supplied volunteers, and this action broke the back of the movement; when the Government undertook to present the demands to Parliament, the employees returned to work (Jan. 22). The railwaymen, too, declared a general strike throughout Italy on the 20th, though only 66,000 men actually responded out of a total of 193,000. Here, again, it was the provision made by volunteers that enabled the Government to face the situation. On no line was the railway service wholly suspended: 1,063 trains ran on the first day, and the number was raised to 1,789 on Jan. 29, when, after Sig. Nitti came forward with concessions, the strike ended. All strikers were readmitted and although their wages were not paid to them the amount was to be devoted to a building fund for railwaymen's dwellings, the decision on the men's original demands being referred to Parliament, while the eight-hour day was to be extended as soon as possible to the few categories to whom it had not yet been applied.

*Further Strikes and Disorders, 1920.*

Other strikes and disorders followed, of which the most serious were the strike of men on the secondary railways of Lombardy, which lasted several weeks (Feb.–April); the strike in the Mazzonis cotton mills at Luserna and Ponte Canavese, where the workmen occupied the factories for a few days; the metal workers' strike at Turin, which began on March 24 over a dispute about a clock that had been tampered with at the F.I.A.T. works, and ended on April 23 with the defeat of the strikers. The railwaymen caused further trouble by refusing to run trains which conveyed troops or police; and on June 8–24 the Cremona railwaymen struck because the under station-master had insisted on forwarding a train which they suspected of conveying war material to Poland, the strike extending to Milan and other places. At Viareggio there were serious disorders on May 1, 2 and 3, which began with a row over a football match. On June 26 a mutiny broke out at Ancona, promoted by anarchists. There had been a good deal of discontent among the men of the 11th Bersaglieri because their regiment, of which they were justly proud, was to be disbanded; furthermore, the anarchists spread the false report that they were to be sent to Albania, an unpopular destination. On the morning of the 26th some anarchists disguised as Bersaglieri entered the barracks and induced a certain number of the soldiers to revolt and disarm the officers. Other officers, however, quickly succeeded in restoring discipline, and when bands of anarchists and other criminals in the town, who thought that the mutiny in the barracks was succeeding, proceeded to pillage the shops and terrorize the inhabitants, the Bersaglieri, including the ex-mutineers at their own request, went out into the streets and quelled the disorders, seizing the labour exchange, which was the anarchists' headquarters, by assault. Disorders continued outside the town a little while longer, as the anarchists from the neighbouring hills fired on passing trains, killing and wounding several persons. By the 27th order was fully restored and large numbers of arrests were made: in all 25 persons had been killed. The mutineers were tried in March 1921 and got sentences up to eight years.

In the meanwhile there had been another Cabinet crisis. On March 13 Sig. Nitti, finding himself unable to conduct the Government in the face of the growing opposition, resigned. But as no one could be found ready to assume office, he was again entrusted with the formation of the Cabinet, which included Sig. Bonomi (War), Schanzer (Finance), Luzzatti (Treasury), Torre (Education), De Nava (Public Works), Falcioni (Agriculture), Alessio (Post Office) and Raineri (Liberated Provinces); the other ministers retained their portfolios, but the Transport Ministry was suppressed. Count Sforza, High Commissioner at Constantinople, was made Under Secretary for Foreign Affairs. The new Cabinet was not well received in the Chamber, and on a vote of confidence it only got 250 votes to 195 (June 30). The Chamber voted in favour of continuing the uneconomic policy of selling bread under cost price, and proposed to make up the deficit by a bill confiscating war profits.

*New Cabinet reconstructed.*

On April 17 1920, the Supreme Council met at San Remo under the presidency of Sig. Nitti, Britain being represented by Mr. Lloyd George and Lord Curzon, France by M. Millerand, and Italy by Sig. Nitti and Senator Scialoja. Some of the other Allied Governments were also represented, and numerous military, naval and air experts and commercial specialists were present. The bases of the treaty with Turkey were there laid down, and the Adriatic question was also raised. Mr. Lloyd George and M. Millerand stated that the only alternatives were the Memorandum of Dec. 9 or the Pact of London. Of the two the latter found more favour in Italian circles, especially in the army, because the former, while providing an unsatisfactory solution of the Fiume problem, gave Italy an impossible eastern frontier. But before the Italian delegation could come to a decision, M. Trumbich, the Yugoslav Foreign Secretary, telegraphed to Sig. Nitti stating that the Yugoslavs preferred direct negotiations with Italy as more likely to lead to an amicable solution. The premier having agreed to this, the Adriatic question was adjourned to an Italo-Yugoslav meeting, and the conference broke up on the 26th. Senator Scialoja met the Yugoslav delegates, MM. Paschich and Trumbich, at Pallanza on May 10; but in the meanwhile Sig. Nitti's parliamentary position had become worse again owing to the general dissatisfaction at his internal policy, and on the 12th the Cabinet, outvoted by 293 to 112, resigned, the crisis, of course, broke up the Pallanza conference.

*San Remo Council.*

After a protracted interval, during which Sig. Bonomi was entrusted with the formation of a Cabinet but failed, Sig. Nitti was again sent for, and on May 22 succeeded in composing a ministry for the third time, with the following changes:—Ruini (Colonies), Falcioni (Justice), De Nava (Finance), Schanzer (Treasury), Rodino, of the *Rotula Popolare* (War), Peano (Public Works), Micheli (Agriculture), Abbiate (Industry), Panatore (Post Office) and La Pegna (Liberated Provinces). But even at its third reincarnation the Nitti Ministry was stillborn, and found little favour in any quarter. The arrest of all Dalmatians and Fiumani in Rome, ordered by Nitti, in consequence of a riot between a patriotic students' demonstration and the police in Rome on May 24, provoked violent indignation throughout Italy. The premier's failure to solve the Adriatic problem alienated his remaining supporters. His fall at last came over his bread policy. On June 9 the Cabinet issued a decree raising the price of bread to 1.50 lire per kgm., but Sig. Nitti, yielding to the Socialists, withdrew it five days later. The Cabinet now resigned, and Nitti's premiership came to an end.

*Fall of Nitti.*

With Nitti's fall, Giolitti was the only man capable of forming a Government. The wheel had come full circle in Italian politics. The advent of Sig. Giolitti at first caused some alarm in Allied countries. But the composition of his Cabinet, constituted on June 26, to some extent dispelled both fears and expectations. It comprised Count Sforza as Minister for Foreign Affairs, Meda (Treasury), Bonomi (War), Luigi Rossi (Colonies), the eminent philosopher Benedetto Croce (Education), Peano (Public Works), Labriola, a reformed revolutionary Socialist (Labour), Alessio (Industry), Fera (Justice), Micheli (Agriculture) and Sechi (Marine). The ministry contained only two pure Giolittians—Tedesco (afterwards substituted by Facta) and Peano; the other ministers represented all shades of Constitutional opinion, from the Catholic Meda to the Radical Alessio and the ex-revolutionist Labriola. On June 24 Giolitti presented various treaties to Parliament for ratification and laid several bills before the Chamber—the obligatory conversion of bearer shares and bonds into nominative certificates, so as to prevent evasion of the new levy on capital; the confiscation of war profits; the increase of sundry taxes; a bill for enforcing the cultivation of cereals, and one instituting an inquiry into war expenditure. On the 29th Sig. Meda made his financial statement for 1920–1, which showed a deficit of one milliard for ordinary expenditure; but the extraordinary expenditure, including the sale of bread under cost, raised the deficit to 14 milliards.

*Giolitti Ministry.*

No appreciable change was made in Italy's foreign policy. Public feeling towards the Allies had not been too cordial for some time past. With Czechoslovakia relations were cordial, while Italian sentiment towards the Poles and the Rumanians was also friendly. Towards the Yugoslavs alone there was antagonism. With regard to the enemy states feeling had certainly changed since the Armistice. Now that the Habsburg Monarchy was broken up and the Alpine frontier satisfactorily settled, Italy felt no longer any bitterness towards Austria. Against Germany there had never been the same hatred as against the Habsburg Monarchy, and the hard attitude of the French over the execution of the Peace Treaty produced a certain reaction in Germany's favour. In the Allied conferences Italy's representatives, while admitting the necessity for disarming Germany, always tried to introduce a spirit of conciliation, for the common good of Europe; and in this they usually found themselves in agreement with their British colleagues. For Hungary there was also a certain amount of sympathy, and Italy was much relieved when that country succeeded in liberating itself from Bolshevism under Bela Kun. With regard to the League of Nations the Government and public opinion were rather sceptical. The fact that President Wilson was the author of the idea was not a recommendation in Italy. A small group of earnest and high-minded men, of whom the late Sig. Bissolati and Senator Ruffini were the most eminent, strenuously advocated the League's principles, while Senator Tittoni, Italy's representative on the Council and the Assembly, supported them with vigour and ability. Still, the League found considerable support both among the Radicals and among the Catholics. The Pope, in his encyclical of May 25, while authorising Catholic heads of states, for the first time, to visit Rome, expressed his hope for its success.

*Foreign Policy.*

In June trouble had broken out in Albania. Gen. Ferrero, who had commanded the Italian forces there during the war, had proclaimed an Italian protectorate in June 1917, but the legal status of Italo-Albanian relations had never been properly defined. Italian troops had occupied all Albania south of the Voyusa, and in the last months of the war had pushed beyond the river, some civil officials had also been appointed. After the Armistice the rest of Albania was also occupied, but unfortunately the officers and civil officials who had at first taken a real interest in the people were recalled, and were succeeded by others who were less sympathetic; this proved a cause of acute discontent. The various agreements whereby Italy was to hand over parts of Albania to Greece and Yugoslavia aroused great dissatisfaction. An Albanian Government had been formed at Tirana, and the Italian garrison had been reduced to a minimum; and in the spring of 1920 Albanian bands began to be formed, composed largely of men who during the war had been armed and trained by the Italians. On June 5 they attacked various Italian outposts, and some of the smaller outlying detachments, including that of Tepelani, were wiped out. Valona itself was attacked on June 11th, and some of the Albanians [illegible] the town. Reinforcements were rapidly conducted

in the town rose in revolt but the rebels were beaten off with heavy losses. Reinforcements were hurried across, and subsequent attacks were repulsed. But on June 24 Sig. Giolitti announced that Italy would withdraw her troops from Albania, and open negotiations with the Tirana Government. The negotiations initiated on July 4 were concluded at Tirana on Aug. 3, Italy agreeing to evacuate Albania, retaining only the island of Saseno, which dominates Valona harbour. The last Italian troops left Valona on Sept. 2.

*Treaty with Turkey.*

At the Spa Conference (July 5–16) Italy, represented by Count Sforza and Sig. Bertolini, who was Italian delegate on the Reparations Commission, succeeded in getting her share of the German indemnity raised to 10%, that of the Austrian, Hungarian and Bulgarian indemnities to 25%, while Great Britain and France ceded to Italy their share of the Austrian tonnage. On Sept. 6 a meeting of Italian, British, French and German delegates met at Stresa to deal with the distribution of foodstuffs and coal. Incidents occurred between Italian and Greek troops in Asia Minor, as the latter constantly tended to go beyond the limits assigned to their occupation. On Aug. 6 Count Sforza announced that, as the Turkish treaty was about to be signed, the Tittoni-Venizelos agreement was rescinded. The treaty with Turkey was signed at Sèvres on the 10th. Italy obtained economic priority over a wide zone in Anatolia, extending from the Gulf of Adramit, round the territory assigned to Greece, to the watershed between the Great and the Little Meander, then along the latter to the sea coast and from Scala Nuova to a point between Adalia and Selevke, and inland as far as Konia; she also acquired a concession for exploiting the Heraclea coal fields. A separate agreement was concluded with Greece concerning the islands; Italy would cede the Dodecanese minus Khalki and Castellorizo, which together with Rhodes would remain under Italian rule for 15 years, and then, if Britain evacuated Cyprus, a plebiscite was to decide to whom they were to belong. On Aug. 21 Sig. Giolitti had a friendly meeting with Mr. Lloyd George at Lucerne, when it was agreed that, as long as Russia tried to impose on Poland conditions incompatible with her independence, it was impossible to have dealings with her. On Sept. 11–14 he conferred with M. Millerand at Aix-les-Bains on the general political situation. These conferences tended to improve Allied relations.

For some months the Adriatic question was not discussed, but numerous incidents occurred in Dalmatia between Italians and Slavs. Serious disorders occurred on July 11 at Spalato, where the Croatian mob murdered the commander of the Italian cruiser "Puglia" and wounded other officers and sailors. Protest demonstrations were held at Trieste on the 13th, and, in consequence of shots being fired from the offices of one of the Yugoslav institutions, several of the latter were burnt to the ground or wrecked. At Fiume the National Council resigned on Sept. 7, and D'Annunzio proclaimed the independence of the town and its territory under the name of "*Reggenza del Carnaro*," for which he composed a curious semi-mediaeval constitution, but its frontiers were not defined. Incidents also occurred in the plebiscite area of Carinthia, where Yugoslav bands attacked and wounded some Italian officers and men (Sept. 26); the Yugoslavs were, however, obliged by the Allies to evacuate that region, and the plebiscite resulted in favour of union with Austria.

As long as Mr. Wilson was president of the United States no settlement of the Adriatic problem was possible. Now, however, that his term was nearly up, the Yugoslavs felt that a direct understanding with Italy was the best way out of the tangle. The Italian Government communicated to Britain and France the conditions it intended to propose to the Yugoslavs, and both the Allies brought pressure to bear on Belgrade to accept them. A meeting was held at Rapallo on Nov. 8, Italy being represented by Sig. Giolitti, Count Sforza and Sig. Bonomi, assisted by Gen. Badoglio and Admi. Acton, and Yugoslavia by MM. Vesnitch, prime minister, Trumbitch, Minister for Foreign Affairs, and Kosta Stojanovich, Minister of Finance, assisted by Col. Kalafatovich. Negotiations were rapidly conducted, and on Nov. 12 the treaty was signed.[1] Italy agreed to waive her rights based on the Pact of London over Dalmatia, while Yugoslavia renounced all claims to Trieste, Gorizia and Istria, and certain adjoining districts of Carinthia and Carniola. The following frontier was agreed upon:—Monte Pec (where Italy, Austria and Yugoslavia meet) to Mt. Yalovets (Jalovec), the watershed between the Isonzo and the Wurzen See and then the Wocheiner Save, N.E. slopes of Mt. Mozik, E. slope of Mt. Porzen, W. slope of Mt. Blegos (leaving the Podlanisham passes to Italy), Zelse, Cabranska, E. of Mt. Trstenik, E. of Griza, E. of Matuglie, frontier of Fiume on the Fiume-Castua road; the islands of Cherso, Lussin, Lagosta and Pelagosa were assigned to Italy, and also the town of Zara. Italy and Yugoslavia recognized the full independence of the state of Fiume, consisting of the ancient *Corpus Separatum* and a small strip of Istrian territory. All Italian-speaking natives of the territories assigned to Yugoslavia were granted the right to opt for Italian citizenship without having to leave the country, and full freedom of language, culture and religion, with reciprocity for Yugoslavs in Italy; special provisions in favour of economic concessions accorded to Italian citizens before Nov. 12 1920 were agreed to. Italy renounced her rights to the part of Dalmatia assigned to her by the Pact of London, except for the town of Zara, to all the islands except those mentioned above and to Longatico and a couple of other small districts on the eastern frontier. All that she obtained in exchange was the recognition of the Italian character of Fiume. By a secret clause, however, which soon became public property, Porto Baros, an integral part of the Fiume port system, was practically promised to Yugoslavia. The Rapallo Treaty was ratified by the Prince Regent of Serbia on Nov. 22, by the Italian Chamber on the 27th (263 votes in favour, 14 against and 50 abstentions), by the Senate on Dec. 17 by 215 in favour and 29 against; 87 senators signed a statement that they accepted the treaty, but declared that it left the Adriatic defence problem unsolved and created difficult conditions for Fiume and Zara. The treaty became law on the 19th and ratifications were exchanged on Feb. 2 1921. Italy thus acquired 9,200 sq. km. with 948,768 inhabitants.

*Treaty of Rapallo.*

There still remained the question of D'Annunzio. He refused to recognize the validity of the treaty, because he disapproved of the cession of Dalmatia and of the frontiers assigned to Fiume: as the latter had not been a party to the treaty, he considered himself free to disregard it. He sent detachments of his *legionari* to Castua, Veglia and Arbe and attempted to invade Dalmatia. But the Government was determined to enforce the treaty, and, after protracted but fruitless negotiations with D'Annunzio, it established a blockade round Fiume. D'Annunzio again tried to tamper with the loyalty of the blockading troops and seamen, and succeeded in inducing the crews of two destroyers and two torpedo boats to arrest their officers and go over to the Fiumani; the same thing happened with the crews of two armoured cars. Many of D'Annunzio's followers, however, including Gen. Ceccherini and Prof. Pantaleoni, abandoned him. On Dec. 23, D'Annunzio having refused to obey Gen. Caviglia's summons to submit, operations of a more serious character were begun. There was some fighting that day and the two following days, and on the 30th D'Annunzio authorized his plenipotentiaries, Sig. Giganti, mayor of Fiume, and his war minister, to accept the conditions imposed by Gen. Caviglia. The town was to be placed under the authority of the municipal council and order maintained by local volunteers, D'Annunzio's *legionari* to be disarmed and to leave the town, and the Italian soldiers who had deserted to D'Annunzio to be pardoned and sent back to their units, except those who had deserted after the Rapallo Treaty—these were arrested and courtmartialled. Italian *carabinieri* would enter Fiume to assist the local levies until after the elections to the Constituent Assembly. D'Annunzio himself left Fiume on Jan. 18 1921. The end of the Fiume adventure was received with a feeling of relief by all

*D'Annunzio.*

[1] The negotiations at Rapallo and those leading up to that meeting and immediately following it (May 11 1920 to Feb. 2 1921) are set forth in a "Green Book" published by the Italian Foreign Office on June 20 1921.

In the meanwhile there had been another Cabinet crisis. On March 13 Sig. Nitti, finding himself unable to conduct the Government in the face of the growing opposition, resigned. But as no one could be found ready to assume office, he was again entrusted with the formation of the Cabinet, which included Sig. Bonomi (War), Schanzer (Finance), Luzzatti (Treasury), Torre (Education), De Nava (Public Works), Falcioni (Agriculture), Alessio (Post Office) and Raineri (Liberated Provinces); the other ministers retained their portfolios, but the Transport Ministry was suppressed. Count Sforza, High Commissioner at Constantinople, was made Under Secretary for Foreign Affairs. The new Cabinet was not well received in the Chamber, and on a vote of confidence it only got 250 votes to 195 (June 30). The Chamber voted in favour of continuing the uneconomic policy of selling bread under cost price, and proposed to make up the deficit by a bill confiscating war profits.

*New Cabinet reconstructed.*

On April 17 1920, the Supreme Council met at San Remo under the presidency of Sig. Nitti, Britain being represented by Mr. Lloyd George and Lord Curzon, France by M. Millerand, and Italy by Sig. Nitti and Senator Scialoja. Some of the other Allied Governments were also represented, and numerous military, naval and air experts and commercial specialists were present. The bases of the treaty with Turkey were there laid down, and the Adriatic question was also raised. Mr. Lloyd George and M. Millerand stated that the only alternatives were the Memorandum of Dec. 9 or the Pact of London. Of the two the latter found more favour in Italian circles, especially in the army, because the former, while providing an unsatisfactory solution of the Fiume problem, gave Italy an impossible eastern frontier. But before the Italian delegation could come to a decision, M. Trumbich, the Yugoslav Foreign Secretary, telegraphed to Sig. Nitti stating that the Yugoslavs preferred direct negotiations with Italy as more likely to lead to an amicable solution. The premier having agreed to this, the Adriatic question was adjourned to an Italo-Yugoslav meeting, and the conference broke up on the 26th. Senator Scialoja met the Yugoslav delegates, MM. Paschich and Trumbich, at Pallanza on May 10; but in the meanwhile Sig. Nitti's parliamentary position had become worse again owing to the general dissatisfaction at his internal policy, and on the 12th the Cabinet, outvoted by 293 to 112, resigned, the crisis, of course, broke up the Pallanza conference.

*San Remo Council.*

After a protracted interval, during which Sig. Bonomi was entrusted with the formation of a Cabinet but failed, Sig. Nitti was again sent for, and on May 22 succeeded in composing a ministry for the third time, with the following changes:—Ruini (Colonies), Falcioni (Justice), De Nava (Finance), Schanzer (Treasury), Rodino, of the *Rotula Popolare* (War), Peano (Public Works), Micheli (Agriculture), Abbiate (Industry), Panatore (Post Office) and La Pegna (Liberated Provinces). But even at its third reincarnation the Nitti Ministry was stillborn, and found little favour in any quarter. The arrest of all Dalmatians and Fiumani in Rome, ordered by Nitti, in consequence of a riot between a patriotic students' demonstration and the police in Rome on May 24, provoked violent indignation throughout Italy. The premier's failure to solve the Adriatic problem alienated his remaining supporters. His fall at last came over his bread policy. On June 9 the Cabinet issued a decree raising the price of bread to 1.50 lire per kgm., but Sig. Nitti, yielding to the Socialists, withdrew it five days later. The Cabinet now resigned, and Nitti's premiership came to an end.

*Fall of Nitti.*

With Nitti's fall, Giolitti was the only man capable of forming a Government. The wheel had come full circle in Italian politics. The advent of Sig. Giolitti at first caused some alarm in Allied countries. But the composition of his Cabinet, constituted on June 26, to some extent dispelled both fears and expectations. For Hungary there was also a certain amount of sympathy, and Italy was much relieved when that country succeeded in liberating itself from Bolshevism under Bela Kun. With regard to the League of Nations the Government and public opinion were rather sceptical. The fact that President Wilson was the author of the idea was not a recommendation in Italy. A small group of earnest and high-minded men, of whom the late Sig. Bissolati and Senator Ruffini were the most eminent, strenuously advocated the League's principles, while Senator Tittoni, Italy's representative on the Council and the Assembly, supported them with vigour and ability. Still, the League found considerable support both among the Radicals and among the Catholics. The Pope, in his encyclical of May 25, while authorising Catholic heads of states, for the first time, to visit Rome, expressed his hope for its success.

*Foreign Policy.*

In June trouble had broken out in Albania. Gen. Ferrero, who had commanded the Italian forces there during the war, had proclaimed an Italian protectorate in June 1917, but the legal status of Italo-Albanian relations had never been properly defined. Italian troops had occupied all Albania south of the Voyusa, and in the last months of the war had pushed beyond the river, some civil officials had also been appointed. After the Armistice the rest of Albania was also occupied, but unfortunately the officers and civil officials who had at first taken a real interest in the people were recalled, and were succeeded by others who were less sympathetic; this proved a cause of acute discontent. The various agreements whereby Italy was to hand over parts of Albania to Greece and Yugoslavia aroused great dissatisfaction. An Albanian Government had been formed at Tirana, and the Italian garrison had been reduced to a minimum; and in the spring of 1920 Albanian bands began to be formed, composed largely of men who during the war had been armed and trained by the Italians. On June 5 they attacked various Italian outposts, and some of the smaller outlying detachments, including that of Tepelani, were wiped out. Valona itself was attacked on June 11th, and some of the Albanians [illegible] the town. Reinforcements were rapidly conducted

similar movements occurred, attended by more violent episodes, including the murder of a few landlords and farmers, whose colleagues retaliated with equal violence. As a rule, however, the agrarian troubles never assumed the widespread or revolutionary character of the industrial agitations, except in Romagna.

Meanwhile, the public, including the great bulk of all classes, was getting heartily sick of these constant disorders and of the tyranny of a factious minority composed in part of doctrinaires, but largely of criminals of a degenerate type. The middle-class suddenly realized that it was by no means dead, and that if it only organized itself it could again assume the lead. It now set to work to perfect the various associations for social and political defence already mentioned. The movement of the Fascisti, destined to play an important part in the immediate future, was an outcome of the combatants' associations; the Fasci were composed of young men, mostly ex-officers and soldiers, university students, and not a few of the more intelligent workmen, peasant proprietors and small farmers. Their "extreme left" was constituted out of the *arditi* (assault troops), comprising all the more adventurous spirits, while at the other end were older and steadier persons, professional and business men, professors and intellectuals. The Fasci comprised people of all parties, including not a few Socialists who were disgusted with the tendencies of the party. Fasci were formed in one town after another over the whole country.

*The Fascisti.*

On Nov. 4 the great Victory Parade, which had been delayed for two years because Sig. Nitti had been anxious to make people forget the war, was held in Rome, amid scenes of great enthusiasm. The administrative elections were held in Oct. and Nov. and resulted in a decline of Socialist influence as compared with the political election of 1919. Notable successes were gained in Rome, Naples, Florence, Venice, Genoa and even Turin, while at Milan the Socialists got in by a small majority; at Bologna alone among the large towns the Socialist success was overwhelming. The Catholic party came out badly, although it achieved some successes in the Veneto and Lombardy. These successes raised the spirits of the country considerably, but the reign of disorder was not yet over. The formal assumption of authority in the Socialist municipal councils was to offer a pretext for fresh outbursts of violence. What happened at Bologna was particularly remarkable.

*Local Elections 1920.*

On Sept. 20 the Bologna Bolshevists had determined to organize a demonstration as a counterblast to the official celebrations on that day; a patriotic procession of modest proportions went to lay wreaths on the monuments of Victor Emmanuel and Garibaldi, and when it was about to break up it was fired at from a restaurant which was the haunt of the extremists, but some members of the patriotic group fired back. It was the first popular reaction against red tyranny in Bologna, but it was the beginning of the end. On Oct. 14 a strike and demonstration were organized in Bologna and other towns to protest against the "white terror" in Hungary. The anarchist Malatesta came to Bologna and the demonstration ended with the murder of a Royal Guardsman and a police inspector. These crimes provoked a violent reaction. Small groups of Nationalists and Fascisti paraded the streets; tricolor flags appeared everywhere, and the council of the labour unions ordered a cessation of the strike. The authorities showed greater energy and arrested a number of anarchists. The municipal elections were lost, because the anti-Socialist movement was still too recent; but a week later occurred the collapse of the deputy Bucco, who had made himself dictator of Bologna, with a sort of praetorian guard of bravos. Now, however, he began to fear for his own safety, and asked for the protection of the Royal Guards against the Fascisti. Being arrested for having arms in his possession, he tried to buy his liberty by accusing his comrades. This was the end of his power; and afterwards a deficit in the accounts of the labour exchange of which he was secretary, for nearly a quarter of a million, was discovered. On Nov. 21 the first meeting of the new town council was intended to be the occasion of a general revolutionary movement, organized by a certain Martelli, an elementary school-master, and other communist leaders. Two of the constitutional members of the council, one of them Sig. Giordani, a disabled officer, were shot in the council hall by hired assassins. The upheaval of public opinion was now irresistible; the leading organisers had to fly for their lives to San Marino, many arrests were made, and the whole fabric of Bolshevist organization in Bologna crashed. The council never met again, as most of its members were in prison or fugitives from justice, and was eventually dissolved. The Fascisti now proceeded to attack and wreck a number of Socialist and Bolshevist institutions; the best-known Socialist leaders hardly dared show themselves in the streets except under large escorts of Royal Guards or *carabinieri*. At Modena, a Fascista having been murdered by a band of Socialists, a number of Fascisti from Bologna and elsewhere went to attend the funeral; during the ceremony the Socialists fired and killed two Fascisti. Their companions then burnt down the labour exchange and wrecked the office of Donati, the local deputy. The Bologna labour exchange was also burnt down. A parliamentary commission was sent to Bologna to inquire into the affair of Nov. 21, and its report was a terrible indictment of maladministration. The town council finally resigned, and the administration was taken over by a Government commissary.

*Red Terror in Bologna.*

In the province of Ferrara the situation was equally intolerable. Most of the communes were in the hands of the Socialists, while the secretaries of the labour exchanges and the leaders of the labour and agricultural unions had become small despots, not unlike the petty tyrants of the Romagna in the Middle Ages; they amassed fortunes by extortion, blackmail and even open robbery. Landowners, farmers or labourers who refused to submit to their rule were boycotted, fined and occasionally murdered. Farming had become almost impossible; no one could employ labour except through the Socialist, or rather Bolshevist, *leghe;* strikes were endemic, and the landlords barely earned enough to pay the taxes, while the labour leaders made highly profitable speculations in land. Now that the reaction had set in, the Fasci gradually broke down the tyranny of the reds in one district after another, not always without fighting. In Ferrara town the murder of several Fascisti by Socialists on Dec. 20 produced a reaction similar to that of Bologna after Nov. 21. In many places the peasantry found red rule so intolerable that they went over *en masse* to the Fasci, who organized labour employment offices for the equal advantage of all classes. In Feb. the Government withdrew all permits to carry arms and ordered the whole population to give up its arms; a certain number of weapons were given up, but enough remained for fighting between Socialists and Fascisti to continue.

During the last months the Socialist party had shown signs of splitting up. The Reformist group had long ago broken loose and was hardly considered Socialist at all. Now even in the "Official" party two or three tendencies became more and more clearly marked. The extremist group led by Bombacci, Bordiga, Gennari, and, until his fall, by Bucco, proclaimed the necessity for an immediate revolution and the dictatorship of the proletariat. Others, such as Turati and Treves, were frankly opposed to revolution, although favourable to Socialist doctrines. The more moderate section had held a congress at Reggio Emilia in the autumn, at which men like Nofri and Ponzani had the courage to condemn the methods of Soviet Government in Russia. The Russian leaders, however, demanded the absolute and unquestioning submission of the Italian party to the Moscow creed, and decreed the expulsion from the party of all Socialists who were barely suspected of the Reformist heresy, including such veterans of Socialism as Turati and Treves. A general congress of the party was therefore held at Leghorn from Jan. 15 to 22 1921. The Bombacci group were prepared to swallow the full Moscow programme, but the group led by Serrati, editor of the *Avanti*, accepted Russian communism only in a bowdlerized form suited to Italian conditions, while the Turati group frankly opposed revolution. The Congress soon degenerated into wild disorder. The extremists shrieked insults and foamed at the

*Socialist Split.*

In the meanwhile there had been another Cabinet crisis. On March 13 Sig. Nitti, finding himself unable to conduct the Government in the face of the growing opposition, resigned. But as no one could be found ready to assume office, he was again entrusted with the formation of the Cabinet, which included Sig. Bonomi (War), Schanzer (Finance), Luzzatti (Treasury), Torre (Education), De Nava (Public Works), Falcioni (Agriculture), Alessio (Post Office) and Raineri (Liberated Provinces); the other ministers retained their portfolios, but the Transport Ministry was suppressed. Count Sforza, High Commissioner at Constantinople, was made Under Secretary for Foreign Affairs. The new Cabinet was not well received in the Chamber, and on a vote of confidence it only got 250 votes to 195 (June 30). The Chamber voted in favour of continuing the uneconomic policy of selling bread under cost price, and proposed to make up the deficit by a bill confiscating war profits.

*New Cabinet reconstructed.*

On April 17 1920, the Supreme Council met at San Remo under the presidency of Sig. Nitti, Britain being represented by Mr. Lloyd George and Lord Curzon, France by M. Millerand, and Italy by Sig. Nitti and Senator Scialoja. Some of the other Allied Governments were also represented, and numerous military, naval and air experts and commercial specialists were present. The bases of the treaty with Turkey were there laid down, and the Adriatic question was also raised. Mr. Lloyd George and M. Millerand stated that the only alternatives were the Memorandum of Dec. 9 or the Pact of London. Of the two the latter found more favour in Italian circles, especially in the army, because the former, while providing an unsatisfactory solution of the Fiume problem, gave Italy an impossible eastern frontier. But before the Italian delegation could come to a decision, M. Trumbich, the Yugoslav Foreign Secretary, telegraphed to Sig. Nitti stating that the Yugoslavs preferred direct negotiations with Italy as more likely to lead to an amicable solution. The premier having agreed to this, the Adriatic question was adjourned to an Italo-Yugoslav meeting, and the conference broke up on the 26th. Senator Scialoja met the Yugoslav delegates, MM. Paschich and Trumbich, at Pallanza on May 10; but in the meanwhile Sig. Nitti's parliamentary position had become worse again owing to the general dissatisfaction at his internal policy, and on the 12th the Cabinet, outvoted by 293 to 112, resigned, the crisis, of course, broke up the Pallanza conference.

*San Remo Council.*

After a protracted interval, during which Sig. Bonomi was entrusted with the formation of a Cabinet but failed, Sig. Nitti was again sent for, and on May 22 succeeded in composing a ministry for the third time, with the following changes:—Ruini (Colonies), Falcioni (Justice), De Nava (Finance), Schanzer (Treasury), Rodino, of the *Rotula Popolare* (War), Peano (Public Works), Micheli (Agriculture), Abbiate (Industry), Panatore (Post Office) and La Pegna (Liberated Provinces). But even at its third reincarnation the Nitti Ministry was stillborn, and found little favour in any quarter. The arrest of all Dalmatians and Fiumani in Rome, ordered by Nitti, in consequence of a riot between a patriotic students' demonstration and the police in Rome on May 24, provoked violent indignation throughout Italy. The premier's failure to solve the Adriatic problem alienated his remaining supporters. His fall at last came over his bread policy. On June 9 the Cabinet issued a decree raising the price of bread to 1.50 lire per kgm., but Sig. Nitti, yielding to the Socialists, withdrew it five days later. The Cabinet now resigned, and Nitti's premiership came to an end.

*Fall of Nitti.*

With Nitti's fall, Giolitti was the only man capable of forming a Government. The wheel had come full circle in Italian politics. The advent of Sig. Giolitti at first caused some alarm in Allied countries. But the composition of his Cabinet, constituted on June 26, to some extent dispelled both fears and expectations. It comprised Count Sforza as Minister for Foreign Affairs, Meda (Treasury), Bonomi (War), Luigi Rossi (Colonies), the eminent philosopher Benedetto Croce (Education), Peano (Public Works), Labriola, a reformed revolutionary Socialist (Labour), Alessio (Industry), Fera (Justice), Micheli (Agriculture) and Sechi (Marine). The ministry contained only two pure Giolittians—Tedesco (afterwards substituted by Facta) and Peano; the other ministers represented all shades of Constitutional opinion, from the Catholic Meda to the Radical Alessio and the ex-revolutionist Labriola. On June 24 Giolitti presented various treaties to Parliament for ratification and laid several bills before the Chamber—the obligatory conversion of bearer shares and bonds into nominative certificates, so as to prevent evasion of the new levy on capital; the confiscation of war profits; the increase of sundry taxes; a bill for enforcing the cultivation of cereals, and one instituting an inquiry into war expenditure. On the 29th Sig. Meda made his financial statement for 1920–1, which showed a deficit of one milliard for ordinary expenditure; but the extraordinary expenditure, including the sale of bread under cost, raised the deficit to 14 milliards.

*Giolitti Ministry.*

No appreciable change was made in Italy's foreign policy. Public feeling towards the Allies had not been too cordial for some time past. With Czechoslovakia relations were cordial, while Italian sentiment towards the Poles and the Rumanians was also friendly. Towards the Yugoslavs alone there was antagonism. With regard to the enemy states feeling had certainly changed since the Armistice. Now that the Habsburg Monarchy was broken up and the Alpine frontier satisfactorily settled, Italy felt no longer any bitterness towards Austria. Against Germany there had never been the same hatred as against the Habsburg Monarchy, and the hard attitude of the French over the execution of the Peace Treaty produced a certain reaction in Germany's favour. In the Allied conferences Italy's representatives, while admitting the necessity for disarming Germany, always tried to introduce a spirit of conciliation, for the common good of Europe; and in this they usually found themselves in agreement with their British colleagues. For Hungary there was also a certain amount of sympathy, and Italy was much relieved when that country succeeded in liberating itself from Bolshevism under Bela Kun. With regard to the League of Nations the Government and public opinion were rather sceptical. The fact that President Wilson was the author of the idea was not a recommendation in Italy. A small group of earnest and high-minded men, of whom the late Sig. Bissolati and Senator Ruffini were the most eminent, strenuously advocated the League's principles, while Senator Tittoni, Italy's representative on the Council and the Assembly, supported them with vigour and ability. Still, the League found considerable support both among the Radicals and among the Catholics. The Pope, in his encyclical of May 25, while authorising Catholic heads of states, for the first time, to visit Rome, expressed his hope for its success.

*Foreign Policy.*

In June trouble had broken out in Albania. Gen. Ferrero, who had commanded the Italian forces there during the war, had proclaimed an Italian protectorate in June 1917, but the legal status of Italo-Albanian relations had never been properly defined. Italian troops had occupied all Albania south of the Voyusa, and in the last months of the war had pushed beyond the river, some civil officials had also been appointed. After the Armistice the rest of Albania was also occupied, but unfortunately the officers and civil officials who had at first taken a real interest in the people were recalled, and were succeeded by others who were less sympathetic; this proved a cause of acute discontent. The various agreements whereby Italy was to hand over parts of Albania to Greece and Yugoslavia aroused great dissatisfaction. An Albanian Government had been formed at Tirana, and the Italian garrison had been reduced to a minimum; and in the spring of 1920 Albanian bands began to be formed, composed largely of men who during the war had been armed and trained by the Italians. On June 5 they attacked various Italian outposts, and some of the smaller outlying detachments, including that of Tepelani, were wiped out. Valona itself was attacked on June 11th, and some of the Albanians [illegible] the town. Reinforcements were rapidly conducted

different from those of the previous Parliament, save that the Socialists, Communists and Republicans were undoubtedly weaker and the Liberals and Catholics somewhat stronger. But the spirit of the Chamber was different; if the Socialists had suffered a less severe reverse than was expected, the dominant note was the success of the Fascisti and Nationalists. The former were about 40 and the latter ten, while a number of other members not actually inscribed as belonging to either group, but describing themselves as ex-combatants and agrarians, might be classed as sympathizers. The new provinces returned five *Popolari* and one Socialist for the Trentino, four Germans for the Alto Adige, three Italians and one Communist for Trieste, five Italians and one Slav for Istria, four Slavs and one Communist for Gorizia-Gradisca.

On June 11 1921 Parliament was opened by the King amid scenes of great enthusiasm. The Socialists, Communists and Republicans did not attend, nor did the Fascisti of Republican tendencies or the Germans from the Alto Adige. On the debate on the speech from the Throne, while the internal policy of the Government met with general approval from all parties except the Socialists and Communists, its foreign policy was subjected to very severe criticism; Sig. Federzoni, the Nationalist leader, delivered a stringent attack on Count Sforza, whose reply made a bad impression. On June 26 the Cabinet obtained only a small majority on a vote of confidence (234 to 202), and although Count Sforza offered his resignation Giolitti professed to regard the vote as involving his policy as a whole, and the Cabinet therefore resigned. Although Giolitti could have formed a new Cabinet himself he declined to do so; and after various other attempts Sig. Bonomi, the Treasury Minister in the late Cabinet, finally undertook to form an administration. On July 4 the new ministers took the oath. The Cabinet was constituted as follows: Ivanoe Bonomi (Presidency and Interior), Marquis Tomasi della Torretta (Foreign Office), Girardini (Colonies), Rodino (Justice), Soleri (Finance), De Nava (Treasury), Bergamasco (Marine), Corbino (Education), Micheli (Public Works), Belotti (Industry and Trade), Mauri (Agriculture), Beneduce (Labour), Giuffrida (Post Office), Raineri (Liberated Provinces). Sig. Bonomi had at one time been a militant Socialist and editor of the *Avanti*, but he broke away from the party in disgust at its anti-patriotic attitude, and on the outbreak of the World War was a whole-hearted interventionist; he served for a time in the army, was afterwards Minister of Public Works during the war, and after the Armistice Minister of War. The new Cabinet comprised members of all the chief parties except the extreme Right and the Socialists. On July 23 the Chamber gave the new premier a vote of confidence with a majority of 166 (302 to 136). (L. V.*)

### The Post-War Army

As the result of post-war considerations, in November 1919 the Royal Decree No. 2,143 provided for a first preliminary organization of the Italian army as follows: (*a*) an increase, as compared with the pre-war period, of one army command, three Territorial army corps commands, and five Territorial divisional commands (or a total of 5 army commands, 15 Territorial army corps commands and 30 Territorial divisional commands). These measures were suggested by the increase in the extent of the national territory; (*b*) a slight increase in the infantry; (*c*) a very marked reduction in the cavalry; (*d*) a very large increase in the artillery and in the engineers; (*e*) the formation of an Aeronautical Service and of an automobile corps; (*f*) term of service fixed at one year, or even less; (*g*) the force on the estimates reduced to 210,000; (*h*) a budget framed in such a way as to reduce the outlay for the army to 11% of the total expenditure of the State, while before the war it amounted to 14%. This scheme was not carried into effect, as the Government held that under it the army would still have been too large and too expensive as compared with the requirements and financial resources of the moment. It was considered that the increase of territory and of population did not call for the formation of new units; that on the contrary the improved conditions of the frontier should permit of a reduction from the pre-war strength of the army. It was necessary also that the army should weigh as lightly as possible on the financial resources of the country, thus facilitating Italy's economic revival. Furthermore, the Government believed in the principle of an "armed nation" in the sense that it desired to reduce the term of military service in time of peace, training all citizens and getting the most out of them in time of war. Some politicians, in advocating a further reduction of the army, were influenced by pre-war, anti-military and almost anti-national ideas, which had for some time affected the country. In any case, within a few months of the first "provisional organization" a second was planned (Royal Decree No. 451 of April 20 1920).

The following are the details of this organization, and the provisions relating thereto formed the basis of actual conditions in 1921: 4 army commands, consisting of the general appointed to the command of the army in time of war and a very small staff; 10 Territorial army corps commands, named after the city in which the command is stationed; 27 commands of infantry divisions numbered progressively; 3 commands of "Alpini" divisions similarly numbered; one cavalry divisional command. Each army corps has three divisions of infantry or "Alpini," as well as other troops not incorporated into any division. A division of infantry consists of two brigades of infantry (grenadiers, infantry of the line and "Bersaglieri") and one regiment of field artillery. An "Alpini" division includes three regiments of "Alpini" and one of mountain artillery. This formation is made for purposes of instruction. In actual fact the "Alpini" regiments and the mountain artillery are scattered along the whole frontier; so that the commands of "Alpini" divisions have in their territory and under their direct orders only a portion of the Alpine troops allotted to them. They have, on the other hand, direct control over other infantry and artillery units as is the case with an ordinary division. The troops and services of army corps not incorporated into divisions are: a regiment of heavy field artillery; a group of anti-aircraft artillery; a battalion of sappers; a battalion of telegraph operators; an automobile park; a train park; a sanitary company; a supply company. These troops and services are capable of supplying in case of mobilization the requirements of the divisions of the army corps and of the command of such army corps. This arrangement, which has been rendered more practical by stationing the various units within the territory of the big units to which they are assigned, represents a marked improvement on the system prevalent before the war, when there were entire Territorial divisions without artillery, engineers or intendance. Other units, generally of specialists, are distributed in different parts of the country, and, while they are not assigned to divisions of army corps, they receive orders therefrom in matters of discipline and of service.

The infantry should consist of: 2 regiments of grenadiers (one brigade), 102 regiments of infantry of the line (51 brigades), 4 regiments of "Bersaglieri" (2 brigades), 9 regiments of "Alpini," one group of armoured cars. In addition there were in 1921 still other regiments of infantry in Upper Silesia and in the Eastern Mediterranean, as well as 8 regiments of "Bersaglieri" which were to be abolished. The abolition of these regiments had been decided upon for the purpose of not depriving the infantry of the line of its best elements, and in order to preserve an equal number of line regiments which had been formed during the war and had won the gold medal for valour. But popular opposition to the reduction of the "Bersaglieri" units, so characteristically Italian and so full of noble traditions, had the effect of suspending the execution of the proposed measure. For the present, at least, the 12 regiments of "Bersaglieri" remain. The regiments of grenadiers, infantry of the line, and "Bersaglieri" consist of 3 battalions each (2 effective and one reduced to a cadre). Each battalion has 3 companies of rifles and one machine-gun company. "Alpini" regiments are composed of 2 to 4 battalions each (27 in all).

The cavalry consists of 12 regiments (4 of lancers and 8 of light cavalry) and of 4 farrier squadrons (or "palafrenieri"). Each regiment consists of two groups of squadrons—2 per group. There are 4 commands of cavalry brigades, each having 3 regiments. Two of these brigades form the division of cavalry already existing.

The artillery consists of: 27 regiments of field artillery; 3 regiments of mountain artillery; one regiment of artillery drawn by motors; 24 regiments of heavy field artillery; 6 regiments of heavy

artillery; 4 regiments of coast artillery; 3 depot-schools for anti-aircraft artillery. The regiments of field artillery have animal transport. Each regiment has 4 groups, one reduced to a cadre. In each regiment 2 groups are armed with the 75-mm. gun, one group has 100-mm. howitzers, and the fourth group has 65-mm. guns carried on mules. Each group has 3 batteries. The regiment with guns on motor-cars includes 5 groups of 75-mm. guns. To this regiment is allotted the only group of horse artillery still kept up (2 batteries of 75-mm. guns). The heavy field regiments have guns drawn by motors; each has 4 groups of 3 batteries. Some groups are armed with the 149-mm. howitzer; others with the 105-mm. gun. The 6 heavy regiments each consist of 4 groups of 3 batteries (one is reduced to its cadre). Guns are drawn by motors, and are of different types, varying from the 149-mm. gun to the 305-mm. howitzer. Coast regiments have the same formation as the heavy regiments. The depot-schools for anti-aircraft service consist of 3 or 4 groups each. A group has 2 batteries on motor vehicles and a position battery.

The Engineer Corps consists of: 10 battalions of sappers (of 3 companies); 10 telegraph battalions (of 3 telegraph companies, one section of photo-electricians and one of pigeon carriers); one regiment of miners (of 5 battalions); one inland water transport regiment (one lagoon and 3 pontoon companies); one railway regiment.

The Air Force consists of aeroplanes, kite-balloons and airships. The aeroplanes are organized into one group of chasing-machines, one of bombing units and one of scouts. Each group has a depot-school, a certain number of squadrons, of aeroports and stations. There are also a command of Air Force schools having at its dependence various schools, training centres, workshops, etc.; an aeronautic command in the Venezia Giulia controlling a certain number of squadrons; several depot, supply and training offices.

The Automobile Corps of recent foundation includes 10 automobile parks, each of which has a depot, a school and a number of sections which are charged with transport services generally.

The Royal Carbineers ("Carabinieri Reali") are military police, carefully selected, originating from the old Piedmontese army and having very good traditions. During the war the "Carabinieri" were formed into a regiment of infantry which distinguished itself on Podgora, and had to be dissolved at an early date owing to its heavy losses. The "Carabinieri" discharged police duty for the mobilized troops and in the war zone. Now they are divided into 21 "legions" (plus one of recruits) and perform police duty chiefly in the country districts. In some of the big towns there are special battalions of "Carabinieri," formed of riflemen and machine-gunners to be employed together in case of riots. The "Carabinieri" are recruited from volunteers, or from levy men, on special service.

The Royal Guards ("Guardia Regia") for police service constitute a special corps, of a military character, of recent formation and originating from the former police corps. The men enlist under a system similar to that adopted for the "Carabinieri," and discharge police duties in big centres. There are 10 "legions" (plus one of recruits). Like the "Carabinieri" they are divided into battalions and squadrons.

The new recruiting law is based on the principle that all valid men must receive military training and are liable to conscription. The provisions as to physical fitness of the men have been modified considerably so as to reduce the number of those discharged permanently or temporarily as medically unfit. It is calculated that each levy will thus give 250,000 recruits. The majority of these will have to serve eight months, while the rest, consisting chiefly of men who under the old law would have been allotted to the third category, will have to serve three months. In 1921, however, a period of transition was still in existence, and these terms of service were not yet in force. It was expected, however, that men having to serve for eight months would be called up in groups, so that there would always be a certain number of trained men under arms, while those who had to serve for three months would have to be drafted into the infantry.

Men are liable to serve as before from their 20th to their 39th year of age; but the distinction between reservists of the permanent army and those of the mobile and Territorial militias has been abolished. All men on unlimited leave form one large reserve, which in due course is detailed according to age, physical fitness, or special qualifications, to the active army, the troops stationed in the country, the industrial factories, etc.

The force on the 1921 estimates for the time when the eight months' service would be adopted was set down at 175,000 men, and the average yearly outlay at 9·80% of the total expenditure of the State.

(M. R.)

**JACKSON, HENRY** (1839–1921), English classical scholar, was born at Sheffield March 12 1839. He was educated at the Sheffield collegiate school, at Cheltenham College and at Trinity College, Cambridge, where he was elected fellow in 1864 and vice-master in 1914. From 1875 to 1906 he was praelector in Ancient Philosophy, and in 1906 was appointed Regius professor of Greek. In 1908 he was given the O.M. He resigned the vice-mastership of his college in 1919, and died at Bournemouth Sept. 25 1921. His important work in translating and commenting upon Aristotle's Ethics is alluded to in 2.513. He published *Texts to Illustrate Greek Philosophy from Thales to Aristotle* (1901) and a series of articles on "Plato's Later Theory of Ideas" (*Journal of Philology*); also *About Edwin Drood* (1911). The principal articles on ancient Greek philosophers in this Encyclopædia were his contributions.

**JACKSON, SIR JOHN** (1851–1919), English engineer and contractor, was born at York Feb. 4 1851. He was educated at Edinburgh University and received his training as an engineer at Newcastle-on-Tyne. Amongst his more important constructions were the docks at Middlesbrough, Hartlepool and N. Sunderland, the commercial harbour at Dover and the extension there of the Admiralty pier, the last section of the Manchester Ship canal, the foundations of the Tower bridge, the new naval harbour at Simon's Town, Cape Colony, and the irrigation works in Mesopotamia. He was knighted in 1895. From 1910 to 1918 he represented Devonport in the House of Commons. Early in the World War he offered to erect army huts at the bare cost. Complaint was made in April 1917 to the royal commission appointed to inquire into profits made on army huts, that his firm had later claimed 5% on future work and that the amount paid to them was excessive. The commission endorsed this charge, though exonerating the firm from having "intentionally brought about a state of things in which they could extort exorbitant terms." Sir John died at Godalming Dec. 14 1919.

**JACKSON, SIR THOMAS GRAHAM,** BART. (1835– ), English architect, was born in London Dec. 21 1835, the son of a solicitor. After a brilliant career at Oxford, where he became a fellow of Wadham, he entered the office of Sir George Gilbert Scott at the age of 23, and remained there for three years, but his future work showed that he was not very deeply influenced by the somewhat narrowly Gothic method and predilection of Scott. To accommodate himself to the calls upon his sense of propriety in design, one who was later to be asked to add additional building work to many of the Oxford colleges—(Brasenose, Lincoln, Balliol and others, and especially the University Examination Schools)—needed that wide range of knowledge of the architecture of the late 16th and 17th centuries that is indicated in much of Jackson's work. Upon Oxford he has left an especial impress with which his name will be always associated. For Cambridge, again, he carried out many important university buildings, the Law library and school, the Archaeological museum, and the Physiological laboratories amongst them. Less bound there than at Oxford to the precedent of an existing design his work, mostly of a late English Renaissance character, shows facility and invention. His new buildings and additions at so many great English schools—including Eton, Harrow, Rugby and Westminster—formed a very large proportion of his artistic output in the 'eighties and 'nineties. The interior of the chapel at Giggleswick school, Yorks., is an example of that treatment of colour—in marble and mosaic—upon which he relied so much as a complement to his architectural design. He was always keen on bringing together the various arts as tributary to, or allied with, architecture, and in support of this endeavour was a member, and in 1896 master, of the Art Workers' Guild. Jackson's name will also be connected with a large number of new churches for which he was responsible, and of even more in the restoration of which he was concerned, amongst the latter being St. Mary's, Oxford. Though subjected at the time to much criticism as to the decorative features of the exterior, and especially the spire, Jackson's work still holds its own as dealing conscientiously and conservatively with the difficult and disputed problem of restoration. He carried out many new houses, and a large number of alterations and additions to others. As an author he was responsible for several works, covering a wide area of his profession, and, in especial, his many visits to the Nearer East, especially to the Balkan States, have resulted in his giving nearly all of what is known as to the architecture of Ragusa, Dalmatia, Istria and the Adriatic coast. He was so far recognized as the authority on their traditional type of Romanesque building that the Dalmatians sought his help in the building of the Campanile at Zara. In 1910 the Royal Institute of British Architects awarded him their gold medal. He was elected A.R.A. in 1892, and R.A. in 1896, became hon. D.C.L. of Oxford, and hon. LL.D. of Cambridge, and was created a baronet in 1913.

**JACOB, EDGAR** (1844–1920), English bishop, was born at Crawley rectory, near Winchester, Nov. 16 1844, the son of Philip Jacob, archdeacon of Winchester. He was educated at Winchester and New College, Oxford, where he graduated in 1867. He was ordained in 1868, and in 1871 went to India as domestic chaplain to Dr. Milman, Bishop of Calcutta. In 1876 he returned to England, and in 1878 became vicar of Portsea, where he worked wonders in a difficult parish. In 1896 he became Bishop of Newcastle, and in 1903 was translated to the see of St. Albans. This diocese, which embraced a large part of the poorer outlying parts of London, was too large for the effective control of one bishop, consisting as it did of 630 benefices and nearly 900 clergy, and Dr. Jacob worked hard to secure the formation of a new bishopric out of it. It was not, however, until 1913 that the bill providing for the erection of the bishopric of Chelmsford passed. He retired from his see in Dec. 1919, and died at St. Cross, Winchester, March 25 1920.

**JÄGER, GUSTAV** (1832–1917), German naturalist and hygienist (*see* 15.124*), died in 1917.

**JAGOW, GOTTLIEB VON** (1863– ), German Foreign Secretary at the outbreak of the World War, was born June 22 1863 in Berlin. He entered the diplomatic service in 1895 and after having been Prussian minister at Munich, German ambassador at Rome, and German minister at The Hague, was appointed in 1913 Secretary of State for Foreign Affairs. He played an active part in the negotiations preceding the outbreak of the World War and was, in particular, concerned in the German relations with Austria, having been the first member of the Imperial Government in Berlin to become acquainted with the terms of the Austrian ultimatum to Serbia. Jagow retired in Nov. 1916. He wrote a defence of German policy entitled *Ursachen und Ausbruch des Weltkrieges* (1919).

**JAMES, HENRY** (1843–1916), Anglo-American man of letters (*see* 15.143), died in London Feb. 28 1916. In 1913 nearly 300 of his English friends presented him with his portrait by J. S. Sargent, on the occasion of his 70th birthday; in the following year the portrait was damaged by a militant suffragette as it hung upon the walls of the Royal Academy. The outbreak of the World War aroused in him such a passionate sympathy for England and her Allies that he decided to identify himself once for all with England and to apply for naturalization. On July 26 1915 he became a British subject. The following Jan. he was awarded the Order of Merit, the insignia being brought to him on his sick-bed by his friend Viscount Bryce. His later works include *A Small Boy and Others* (1913), *Notes of a Son and Brother* (1914), *The Middle Years* (1917, left uncompleted). Two unfinished novels, *The Ivory Tower* and *The Sense of the Past*, appeared in 1917. In 1915 he contributed a preface to the *Letters from America* of Rupert Brooke, and his impressions of the war were published in 1919 under the title of *Within the Rim*.

See *The Letters of Henry James*, selected and edited by Percy Lubbock, 2 vols. (1920).

**JAMES OF HEREFORD, HENRY JAMES, 1ST BARON** (1828–1911), English lawyer and statesman (*see* 15.144), died at Epsom Aug. 18 1911.

**JAMESON, SIR LEANDER STARR, BART.** (1853–1917), British South African statesman (*see* 15.147). The union of the South African colonies in 1909 accomplished the main object which Jameson had set before himself as a political leader. He wished to carry the spirit of union further by forming a combination of political parties to support a non-racial Government for the new Union, regarded Gen. Botha as the natural leader of such a combination, and was completely ready to serve under him. This project of a "best man" Government, however, was not accepted by Botha, who thought that the Dutch-speaking people of South Africa were not ready for it. The alternative, to which Jameson then set himself, was the formation of a new party representing the majority of the English-speaking people in the Cape, the Transvaal, the Orange Free State and Natal. At a conference in Bloemfontein in 1910, before the first general election for the new South African Parliament took place, this project was carried out. Jameson presided over the conference with a patience, a tact and an insight which exhibited once more his remarkable gift for the ruling of men. The programme of the party thus formed—known as the Unionist party of South Africa—showed his influence in every clause. It repudiated opposition to the Botha Government for the mere sake of opposition, and promised the Prime Minister support in all measures designed to promote racial peace and material prosperity in South Africa. At the first South African general election in Sept. 1910 the Unionists fought on this programme with a considerable measure of success, especially in the Cape and Transvaal provinces. Natal, where the English-speaking people were in a great majority, withheld from Jameson and the Unionists the general support which it might have been expected to give, though the Unionists won a number of seats in that province. For two years Jameson led the Unionists in the South African House of Assembly with great moderation and self-restraint, but was compelled by ill health to retire from the leadership of the party in 1912. He returned to England and settled in London, devoting himself, when his health took a turn for the better, to business interests. He had an intimate knowledge of the affairs of the De Beers Corp. and of the British South African Co., commonly known as the Chartered Co. In June 1913 he became chairman of the Chartered Co., whose general meetings gave him, year by year, till his death in 1917, opportunities of proving in a new sphere his power of exercising a dominating influence over assemblies of men. When the war came in 1914 Jameson devoted himself to public work, leaving to members of the Government the choice of the sphere in which they thought he could be most useful. Meanwhile he had made more than one visit to Rhodesia as chairman of the Chartered Co., and the work which he did on behalf of the territory that he had helped to establish was recognized even by opponents of the policy of the Chartered Co. The war work which the Government chose for him was that of chairman of the Central Prisoners-of-War Committee, to which he devoted himself with all his remaining strength, organizing at the same time more than one private hospital overseas. Jameson's health had been precarious for years, and on Nov. 26 1917 he succumbed to a short illness. His name will stand very high among those of the men who did service to South Africa and Rhodesia. Diffident and utterly free from self-seeking, he was of those who make the least of their service to their country. But his labours for racial reconciliation and material prosperity in South Africa were conspicuous, and the close friendship of Botha was a final proof of the quality of his patriotism. It was, too, the measure of his stature as a man able beyond the recognition of most of his contemporaries, honest and plain-speaking, with a deep devotion to the most lofty ideals of public service. Jameson was created a K.C.M.G. on the inauguration of the Union in 1910 and a baronet in 1911. (B.K.L.)

**JANEWAY, THEODORE CALDWELL** (1872–1917), American physician, was born in New York City Nov. 2 1872, the son of Dr. Edward Gamaliel Janeway, a distinguished physician. He was educated at the Sheffield Scientific School, Yale University (Ph.B. 1892) and the College of Physicians and Surgeons, Columbia University (M.D. 1895). From 1898 to 1906 he taught medical diagnosis in New York University. In 1907 he became associate in medicine in Columbia and two years later professor of medicine. He was attending physician at St. Luke's Hospital and in 1911 became senior attending physician at the Presbyterian Hospital and head of the medical staff. In 1914 he was called to Johns Hopkins University to succeed Dr. William Osler as professor of medicine, and became physician-in-chief to Johns Hopkins Hospital. After America's entrance into the World War he became major in the Medical Officers' Reserve Corps and was engaged in research in Washington, D.C. He died at Baltimore, Md., Dec. 27 1917. He was secretary of the Russell Sage Institute of Pathology, a member of the board of scientific directors of the Rockefeller Institute for Medical Research, and of the editorial board of the *Archives of Internal Medicine*. He was the author of *The Clinical Study of Blood Pressure* (1904).

**JAPAN** (*see* 15.156).—The first national census in Japan took place on Oct. 1 1920; prior to that date only the figures prepared by the local registrars and police authorities were available. Table 1 gives the census figures for Japan proper, Formosa and Japanese Sakhalin, together with those obtained for Korea from the local registrars' records. The figures for Japan proper (area, 148,756 sq. m.) show that she ranks sixth in pop. of the countries of the world, the first five being China, India, Russia, the United States and Germany. With regard to the density of pop., Japan (376 per sq. m.) ranks third, immediately following Belgium (658) and the Netherlands (536), and above Great Britain (374).

Table 1.—Population, 1920

| | Households | Population | | Total |
|---|---|---|---|---|
| | | Male | Female | |
| JAPAN, Proper | 11,222,053 | 28,042,995 | 27,918,145 | 55,961,140 |
| TAIWAN (Formosa) | 690,000 | 1,894,141 | 1,760,257 | 3,654,398 |
| KARAOFUTO (Japanese Sakhalin) | 22,087 | 62,241 | 43,524 | 105,765 |
| CHOSEN (Korea) | 3,297,285 | 8,923,060 | 8,361,147 | 17,284,207 |
| Total | 15,231,425 | 38,922,437 | 38,083,073 | 77,005,510 |

The ratio between men and women of the whole pop. is 100·4 to 100, the number of men being 28,042,995 and that of women 27,918,145. The larger number of men is recorded in the district of Tokyo and Hokkaido (112 men to 100 women) and other 11 prefectures, whilst there are 3 prefectures in which the ratio is balanced and 31 prefectures in which the number of women exceeds that of men, the prefectures of Shiga, Kagoshima, and Okinawa (the Luchu Is.) showing the lowest figures for men (93 men to 100 women). The higher proportion of men is accounted for either by the inclusion of a large city, with its commercial and industrial activities, or of a military barrack or a silver-, copper- or coal-mine. Women are generally found to be more numerous in the provincial districts, for it is oftener men than women who migrate to large cities or even abroad in quest of knowledge or fortune.

*Cities and the Country.*—Table 2 gives the census figures for 16 cities with a pop. numbering more than 100,000 souls.

Table 2.—Principal Cities, 1920

| | House-holds | Male | Female | Total |
|---|---|---|---|---|
| Tokyo | 456,820 | 1,171,180 | 1,001,982 | 2,173,162 |
| Osaka | 276,331 | 673,636 | 579,336 | 1,252,972 |
| Kobe | 138,986 | 324,037 | 284,591 | 608,628 |
| Kyoto | 128,892 | 299,689 | 291,616 | 591,305 |
| Nagoya | 92,426 | 220,276 | 209,714 | 429,990 |
| Yokohama | 95,241 | 224,050 | 198,892 | 422,942 |
| Nagasaki | 37,036 | 90,897 | 85,657 | 176,554 |
| Hiroshima | 34,553 | 83,337 | 77,167 | 160,504 |
| Hakodate | 29,153 | 75,047 | 69,093 | 144,140 |
| Kure | 28,268 | 73,754 | 56,606 | 130,354 |
| Kanazawa | 29,287 | 62,842 | 66,478 | 129,320 |
| Sendai | 21,861 | 62,529 | 56,449 | 118,978 |
| Otaru | 21,275 | 56,406 | 51,707 | 108,113 |
| Sapporo | 20,038 | 53,011 | 49,560 | 102,571 |
| Kagoshima | 19,942 | 49,191 | 53,205 | 102,396 |
| Yawata | 22,322 | 56,173 | 43,854 | 100,227 |

There are 25 cities with a pop. of from 50,000 to 100,000; 94 with from 30,000 to 50,000, and eight with less than 30,000.

*Economic and Financial Conditions.*—Prior to 1914 Japan had already almost recovered from the effects of the Russo-Japanese War, and her economic activities had yearly been making steady and more or less symmetrical progress. The World War, however, caused and even compelled the Island Empire to undertake a prodigious development of her commercial and industrial life.

During the early days of the war the disturbance in international commercial relations affected the Japanese nation in common with the other peoples of the world. She was immediately conscious of the disquieting falling-off in the demand for silk, the most important of her exports. This situation, however, began to be perceptibly modified later, when a huge demand arose on the part of Russia and other Allied Powers for the supply of immense quantities of munitions of war, and, in addition, the inability of the European belligerents to continue their overseas commerce on the pre-war scale caused a demand for Japanese products in the markets of India, the South Seas, Australia, S. America and even Africa. The wave of prosperity which the satisfaction of these demands created was increased by the great volume of the carrying trade which fell to Japan's share, owing to the number of Allied merchantmen which had been directed to warlike purposes. All these factors, in addition to the natural decline in imports from the countries of the European belligerents, conduced to turn the balance of Japanese trade in her favour practically for the first time in 20 years.

A great increase in the amount of specie held by Japan abroad inevitably resulted, and the gold accumulated at home also tended to grow rapidly. The lowering of the rate of interest followed; prices of shares began to soar—the shares of the steamship companies advanced by 400% in 1915—and the enthronement of the Emperor in the autumn of that year strewed with roses the already bright path leading to improved industrial activities. A considerable number of new undertakings, notably in the field of shipbuilding, iron and steel manufacture and the chemical industry, were brought into being. Once more the rate of interest showed an upward tendency, and the issue of bank-notes increased rapidly. The trend of circumstances described above became more and more accentuated as time went on, until at the end of 1916 the premature peace-talk counselled temporary caution to Japanese manufacturers and merchants.

The momentous events of 1917, such as the general Allied trade embargo, the introduction by the Germans of ruthless submarine warfare, the declaration by the United States of war upon Germany and the *débâcle* of the Russian Revolution, all had their repercussion upon Japanese commerce. The continuous internal troubles in China further added to the general international confusion. Nevertheless, in spite of the far-reaching effects of these great outside influences, Japan's trade and industry continued on the whole to register a steady development. The tightened restrictions on commerce on the part of Great Britain and the United States, especially the ban placed at one period by the latter on the export of iron and steel, caused a proportionate measure of agitation in the circles of industrial enterprise in Japan. Her shipbuilding and steel industries, however, were relieved from anxiety, and even stimulated into further development, by an arrangement which was speedily arrived at between the United States and Japan as to the exchange of ships and steel.

With the conclusion of the Armistice in Nov. 1918 the demand for warlike materials came to an abrupt end; and the branches of industry and commerce dealing with iron, steel, copper, dyestuffs and chemicals, which had owed their inauguration or development to the abnormal situation caused by the war, received a sudden and serious blow. The demand for bottoms slackened down as a natural consequence, and the shipbuilders, who had been enjoying a period of tremendous and unprecedented prosperity, were forced to arrest their activities. There were even threatening signs of economic depression. But the revived demand for food-stuffs, and industrial materials necessary for the economic reconstruction of Europe, coupled with the roaring trade activities in the United States, still sustained the flourishing state of Japan's commerce.

For the rest, a financial panic which occurred in April 1920, due to over-speculation and misuse of credit, administered a telling blow to trade and industry. Nevertheless, Japan had amassed great wealth, her industry had advanced marvellously, not only in quantity but in variety; her merchants had acquired wide knowledge and a seasoned experience; her ships now cruised to the remotest corner of the seven seas; and many a country had been newly added to the list of her foreign customers. The foundation of industrial Japan had become incomparably stronger than in pre-war days and the brightest vista opened up before her future economic development.

*The State Budget.*—The general budget of Japan, which was doubled both in revenue and expenditure during the Russo-Japanese War, was more than redoubled in the course of 1910–20. The total revenue and expenditure, which amounted in the fiscal year 1910–11 to 672,874,000 yen (£68,600,000) and 569,154,000 yen (£57,900,000) respectively, balanced at 1,563,000,000 yen (£160,000,000) in 1921–2. Table 3 shows the increasing figures of the Japanese State budget for the decade 1910–20.

Although in the early months of the war the more or less disturbed economic conditions in Japan checked the natural increase of revenue in general—the customs duties in particular yielded a considerably diminished income owing to the marked decline in foreign trade—the gradual recovery, followed by the unprecedented prosperity of industry and commerce, caused the revenue to show an upward tendency. Since 1916–7 the income-tax, especially the amount contributed by commercial and industrial corporations, had begun rapidly to ascend in amount. Receipts from public undertakings and State property, especially the income of the steel foundries and the proceeds of munition sales to Allied belligerents, contributed enormously to the general growth of the revenue, although it should be noted that the manufacture of arms necessitated the disbursement of a sum practically equal to the income.

A noteworthy step was taken in 1918 in the creation of the war profits tax, which required the profiteers, including ship *narikin*, to pay not less than 20% either of their income in excess of their average profits in pre-war days, or, in case such could not be ascertained, of 10% of their invested capital. This item yielded nearly 82 million yen (£8,300,000) in 1918–9 and 93 million yen (£9,400,000) in the following fiscal year, but with the end of the war the revenue dropped to 7 million yen (£700,000).

As the war progressed it became more and more imperative that Japan should put forth her best efforts to render to her Allies military and economic industrial support. The trade boom and the enhancement at home of the national power also led to expansive industrial and educational measures. It became, moreover, evident that the salaries and wages of Government officials should be raised to meet the increased cost of living. It was only natural that State expenditure should expand in juxtaposition with the growth of the revenue. With the completion of the national defence programme spread over seven years, there were to be further enormous outlays.

Table 3.—Budget Figures 1910–21 (in 1,000 yen)

| Year | Revenue | | | Expenditure | | | Surplus Revenue |
|---|---|---|---|---|---|---|---|
| | Ordinary | Extraordinary | Total | Ordinary | Extraordinary | Total | |
| 1910–1 | 491,331·3 | 181,542·4 | 672,873·7 | 412,009·1 | 157,144·8 | 569,154·0 | 103,719·7 |
| 1911–2 | 508,558·6 | 148,633·5 | 657,192·2 | 409,889·0 | 175,485·5 | 585,374·6 | 71,817·6 |
| 1912–3 | 552,085·5 | 135,306·8 | 687,392·4 | 416,895·0 | 176,701·3 | 593,596·4 | 93,796·0 |
| 1913–4 | 575,428·0 | 146,547·4 | 721,975·4 | 415,635·8 | 157,998·1 | 573,633·9 | 148,341·5 |
| 1914–5 | 536,342·5 | 198,305·5 | 734,648·0 | 399,225·4 | 249,195·0 | 648,420·4 | 86,227·6 |
| 1915–6 | 538,999·6 | 169,616·2 | 708,615·8 | 386,516·4 | 196,753·3 | 583,269·8 | 125,346·0 |
| 1916–7 | 622,052·1 | 191,256·5 | 813,308·6 | 386,065·9 | 204,729·3 | 590,795·3 | 222,513·2 |
| 1917–8 | 763,760·1 | 321,198·2 | 1,084,958·3 | 437,821·4 | 297,202·7 | 735,024·2 | 349,934·1 |
| 1918–9 | 911,579·4 | 567,536·4 | 1,479,115·8 | 490,167·1 | 526,868·4 | 1,017,035·5 | 462,080·2 |
| 1919–20 | 839,140·9 | 225,049·3 | 1,064,190·3 | 505,936·6 | 558,253·6 | 1,064,190·3 | — |
| 1920–1 | 1,012,614·1 | 322,741·1 | 1,335,355·3 | 724,790·8 | 610,564·4 | 1,335,355·3 | — |
| 1921–2 | 1,287,219·2 | 275,323·5 | 1,562,542·7 | 922,940·8 | 639,601·9 | 1,562,542·7 | — |

To meet all these increases in expenses, the war profit tax alone was calculated to be insufficient; and the income-tax was so adjusted as to yield a larger revenue, at the same time, with a view to effecting a fair distribution of the burden. The *saké* tax was raised; postal, telegraph and telephone charges were increased; and a higher price was charged for the Government monopoly tobaccos.

Those revenue measures were rewarded with success in 1918–9, and in the following fiscal year the sums so raised still showed an increase. In 1919–20 the effect of the conclusion of the war was felt in the marked decrease in the returns of the steel foundries. But in all other items, the budget estimates were greatly exceeded. The bourse tax and forest revenues were double the figures of the previous year. Japan had thus emerged from the five years of the World War with her financial position considerably strengthened, though during 1920–1 the effect was discounted by industrial unrest and economic depression which reacted adversely on the domestic financial conditions. The budget for 1921–2 contained the estimated expenditure for the eight-to-eight fleet-unit scheme, and it was a question at the end of 1921 how far this might be subject to modification as a result of the Washington Conference. The chief items of revenue and expenditure for 1921–2 are given in Table 4.

Table 4.—Revenue and Expenditure 1921–2

| *Ordinary Revenue:*— | Yen |
|---|---|
| Land Tax | 73,985,325 |
| Income Tax | 268,099,093 |
| Business Tax | 48,670,969 |
| Tax on liquors | 171,237,991 |
| Sugar Excise | 41,886,037 |
| Consumption Tax on textile fabrics | 33,260,882 |
| Customs Duty | 69,872,070 |
| Other Taxes | 44,452,169 |
| Stamp Duty | 90,165,422 |
| Receipts from postal, telegraph and telephone services | 187,177,396 |
| Forests | 32,057,000 |
| Profits of monopoly | 93,981,954 |
| Other receipts from public undertakings and State property | 17,611,690 |
| Miscellaneous receipts | 21,260,434 |
| Transferred from special account for deposits | 43,500,776 |
| Total | 1,237,219,208 |
| *Extraordinary Revenue:*— | Yen |
| Proceeds of sale of State property | 7,361,888 |
| Receipts from the issue of public loan | 54,264,892 |
| Public bodies' contributions to expenses for river, road, harbour improvements, etc. | 16,373,877 |
| Transferred from special account for various funds | 8,251,168 |
| Local contributions to expenses incurred by the State | 6,356,400 |
| Surplus of the preceding year transferred | 193,095,985 |
| Miscellaneous receipts | 39,719,379 |
| Total | 325,323,589 |
| Total Revenue | 1,562,542,797 |
| *Ordinary Expenditures:*— | Yen |
| Imperial Household | 4,500,000 |

| Communications | 56,690,308 |
| Total | 659,601,974 |
| Total Expenditure | 1,562,542,797 |

*The National Debt.*—The National Debt stood at 2,793,000,000 yen (£284,800,000) at the end of 1919–20, of which 1,482,000,000 yen (£151,000,000) represented the internal, and 1,311,000,000 yen (£133,700,000) the foreign loans. Table 5 gives the figures.

Table 5.—Debt 1910–20 (in 1,000,000 yen)

| Financial Year | Internal Loans Amount outstanding at the end of the financial year | Foreign Loans Amount outstanding at the end of the financial year | Total | Debt per head in yen |
|---|---|---|---|---|
| 1910–1 | 1,203·1 | 1,447·2 | 2,650·3 | 39·1 |
| 1911–2 | 1,146·2 | 1,437·4 | 2,583·6 | 37·3 |
| 1912–3 | 1,116·2 | 1,456·9 | 2,573·2 | 36·3 |
| 1913–4 | 1,054·6 | 1,529·4 | 2,584·1 | 35·6 |
| 1914–5 | 991·5 | 1,514·8 | 2,506·3 | 33·9 |
| 1915–6 | 1,028·0 | 1,461·1 | 2,489·2 | 33·0 |
| 1916–7 | 1,097·4 | 1,370·2 | 2,467·7 | 32·1 |
| 1917–8 | 1,159·9 | 1,338·7 | 2,498·7 | 32·3 |
| 1918–9 | 1,268·8 | 1,311·1 | 2,579·9 | 33·0 |
| 1919–20 | 1,482·4 | 1,311·1 | 2,793·5 | 36·4 |

*Foreign Trade.*—The rapidity with which Japan's foreign trade had developed, both in volume and extent, during the half-century preceding 1920 provides a remarkable record in commercial history. The total value of exports and imports, which in the first year of Meiji (1868) amounted to the insignificant total of 26 million yen (£2,650,000), increased tenfold in 1895, a hundredfold in 1917, and 167-fold in 1920. The most striking progress was attained during the World War, when Japan's foreign trade leapt from 1,362 million yen (£139,000,000) in 1913 to 4,284 million yen (£438,000,000) in 1920; although it should be remarked that these figures do not correctly represent the proper rate of increase in the volume of trade, owing to the inflation of prices. The war first reacted prejudicially upon the foreign trade of Japan, as well as upon other branches of her commerce and industry, and the figures for the total imports and exports in 1914 indicated the marked decrease of 12·9% on those of the preceding year. The effect of the war in increasing foreign trade first showed itself appreciably in the returns for 1915, when the adverse balance of trade which had obtained for 20 years—with the exception of the years 1906 and 1909, when slight excesses of exports were recorded—was superseded by a favourable trade balance. The total value of the imports and exports for that year was 1,241 million yen (£127,000,000), an increase of 54 million yen (£5,500,000), or 4·5%, compared with 1914, although the value of the total trade for 1913 was not achieved on account of the diminished volume of imports. The favourable tendency in Japan's oversea trade was accelerated in succeeding years, until the excess of exports over imports attained 371 million yen (£38,000,000) in 1916 and 567 million yen (£58,000,000) in 1920.

This sudden expansion of trade was occasioned by the war both directly, through the great demand by the Allied belligerents for munitions of war, and also indirectly, through the temporary retirement of the great industrial Powers of Europe from the arena of world commerce and trade. Soon after the outbreak of the war Japanese goods—chiefly consisting of semi-manufactured and finished articles, such as cotton fabrics, leather goods, watches, silk tissues and so forth—found their way in large quantities not only to the established markets in the Far East, but to various quarters of the world hitherto but little explored by Japanese traders, viz. the South Seas, S. America and even Africa. The most conspicuous expansion, however, was effected in the exports to China and India, and, until the explosion of the Russian Revolution in 1917, large shipments to Vladivostok of munitions of war and food-stuffs for use in European Russia assisted to augment the volume of trade with Asia. The United States began to buy heavily in 1916, when the figures advanced from 204 million yen (£20,900,000) in the preceding year to the substantial amount of 340 million yen (£34,800,000), the goods purchased consisting mostly of raw silk, *kabutai*, cotton yarns, cotton fabrics and tea. British America and also Mexico increased their orders from Japan and the S. American trade showed such glowing prospects as to induce Japanese companies to open shipping facilities to Brazil through the Straits of Magellan.

The import trade, which had been on the wane in the early days of the war, commenced to revive in 1916, owing to larger purchases of raw materials and semi-manufactured goods, such as raw cotton, iron, wool, crude caoutchouc, flax and jute. By far the largest volume of raw cotton came from British India, but the United States had doubled her exports to Japan of that article, as well as of iron, in a twelvemonth. Australia supplied Japan largely with wool.

The war situation developed serious vicissitudes in 1917, and in a measure militated against the trend to expansion of Japan's commerce. The entry of the United States of America into the war, with its attendant embargo on steel, iron and gold, temporarily disturbed the economic equipoise of the Far Eastern Empire. The Russian Revolution and the subsequent repudiation of all foreign liabilities by the Bolshevik commissaries introduced a fresh factor of discouragement in the export trade of Japan. The internal political feuds in China would also have dismayed Japanese exporters but for the tremendous appreciation in the price of silver, which resulted in maintaining an abundant demand for Japanese articles. But in spite of all, Japan's foreign trade made progress more or less on the lines indicated before, until a complete change of the situation was brought about by the conclusion of the Armistice in the autumn of

1918. The demand for munitions of war naturally came to an end, but the rate of exchange on Europe continued on a high level. At home the cost of production had greatly increased owing to the advance in wages and the higher prices of industrial materials, whereas the enriched public demanded a higher proportion of the necessaries of life. An anti-Japanese boycott was proceeding in China to add to the curtailment of Japan's exports. All these circumstances, reënforced by the Imperial Ordinance of Nov. 1919, for the regulation of the price of commodities, temporarily exempting certain food-stuffs and industrial materials from import duties and restricting the exportation of cotton yarns, brought about a reverse in the balance of foreign trade, which had been favourable to Japan for the preceding four years. But the fact that her exports consisted of finished and semi-manufactured articles, as well as of a huge value of raw and waste silk, whilst food-stuffs, raw materials and machinery were mainly imported, was a reassuring sign. Table 6 gives the foreign trade of Japan (excluding bullion) for 1909–20.

Table 6.—Foreign Trade (in 1,000 yen)

| | Exports | Imports | Excess or deficit of Exports |
|---|---|---|---|
| 1909 | 413,113 | 394,199 | + 18,914 |
| 1910 | 458,429 | 464,234 | − 5,805 |
| 1911 | 447,434 | 573,806 | − 66,372 |
| 1912 | 526,982 | 618,992 | − 92,010 |
| 1913 | 632,460 | 729,432 | − 96,972 |
| 1914 | 591,101 | 595,736 | − 4,634 |
| 1915 | 708,307 | 532,450 | +175,857 |
| 1916 | 1,127,468 | 756,428 | +371,040 |
| 1917 | 1,603,005 | 1,035,811 | +567,194 |
| 1918 | 1,962,101 | 1,668,144 | +293,957 |
| 1919 | 2,098,873 | 2,173,460 | − 74,587 |
| 1920 | 1,948,395 | 2,336,175 | −387,780 |

*Coin and Bullion.*—As regards the movement of gold and silver coins and bullion, the balance of trade in favour of Japan, coupled with the increase arising out of freight, charterage and so forth, had resulted in an unusual influx of these metals since 1916, and in the following year the high-water mark was reached, the import being 392 million yen (£40,000,000) as against the export of 154 million yen (£15,700,000). But owing to the ban placed on the export of gold in the United States in 1917, the import of the precious metal to Japan dwindled in value to 5 million yen (£520,000), whilst in view of Japan's own embargo on gold, instituted later as a measure of self-preservation, the export only amounted to 937,000 yen (£96,000). In 1919 there were imported 327 million yen (£33,500,000), as against an exodus to the value of 5 million yen (£520,000); and in 1920 405 million yen (£48,600,000), as against 4 million yen (£410,000). The United States had raised her embargo on gold, but Japan had not yet done so in 1921.

*Distribution of Foreign Trade.*—The dramatic expansion of Japan's foreign commerce was not only in the old markets in Asia and America but to the new fields in the South Seas and Africa. The geographical distribution of the expansion in terms of continents is shown in Tables 7 and 8.

Table 7.—Exports, by Continents (in 1,000 yen)

| To | 1913 | 1918 | 1919 | 1920 |
|---|---|---|---|---|
| Asia | 275,928 | 935,550 | 995,146 | 998,374 |
| America | 191,761 | 597,175 | 877,925 | 632,159 |
| Europe | 147,225 | 298,257 | 194,853 | 195,590 |
| Australia | 8,638 | 64,828 | 30,826 | 58,117 |
| Africa | 1,846 | 46,811 | 24,107 | 38,842 |

Table 8.—Imports, by Continents (in 1,000 yen)

| From | 1913 | 1918 | 1919 | 1920 |
|---|---|---|---|---|
| Asia | 348,055 | 812,713 | 1,074,370 | 942,547 |
| America | 127,035 | 655,011 | 791,643 | 910,648 |
| Europe | 220,290 | 82,787 | 162,970 | 305,318 |
| Australia | 14,943 | 48,874 | 56,635 | 62,459 |
| Africa | 7,189 | 38,627 | 53,168 | 87,157 |

In the receipt of exports from Japan, the United States of America has always headed the list, the zenith of purchase being reached in 1919—that country taking 29 % of the total value of exports in 1913, 28 % in 1918, 39 % in 1919, and 28 % in 1920—and she has been followed immediately by China (including Kwantung province), whose shares in those years were 29 %, 25 %, 28 % and 27 % respectively. Next to China, though with a wide hiatus, came France in 1913 and then followed Hong-Kong, Great Britain, British India, Italy, Germany and others. But British India and Great Britain had surpassed France by 1918. Notable, also, are the advances of Australia, the Dutch East Indies, the Philippine Islands, Egypt, Argentina, British America, Cape Colony, Hawaii and others in the scale of demand for Japanese goods.

As regards imports into Japan, British India, which had been the chief supplier for several years precedent to the World War (her share was 23 % in 1913), yielded her place to the United States in 1916. The value bought by Japan from the latter country aggregated 766 million yen (£78,400,000, 35 % of the total) in 1919 and 837 million yen (£85,700,000, 36 % of the total and nearly five times the figures of 1913) in 1920. Great Britain's sale to Japan showed a marked decline during the war, but in 1920 a revival had set in. As in the case of exports, Asia, the South Seas, South America and Africa have all contributed fair shares to the advancement of Japan's import trade; but various European countries, including Germany, commenced to resume their activities in 1920.

Tables 9 and 10 show the development of Japan's foreign trade in more important commodities.

Table 9.—Principal Exports (in 1,000 yen)

| Article | 1914 | 1918 | 1920 |
|---|---|---|---|
| Silk (raw waste, floss, etc.) | 169,720·7 | 412,848·9 | 418,140·7 |

| Paper, books and pictures | 10,445·8 | 17,765·4 | 36,191·7 |

*Industrial Development.*—Although the expansion of Japanese industries was enormous during the Word War, the rate of progress registered in the pre-war period of 1908–13 had also been remarkable. In 1908 there were 11,390 industrial establishments and 196 Government factories; in 1913 the Government factories had decreased to 188 (in 1918 there was a further drop to 161), but the other industrial establishments had increased in number to 15,811, or 38·8 %. By 1918 the figure had risen to 22,391, an increase of 41·6 % on 1913 and 96·6 % on 1908. In a decade, that is to say, Japan had practically doubled the number of factories in operation. Table 11 illustrates the development.

Table 11.—Industrial Progress

| | No. | Motors | H.P. | Men | Women |
|---|---|---|---|---|---|
| **Government Factories** | | | | | |
| 1908 | 196 | 1,746 | 169,510 | 98,533 | 25,351 |
| 1913 | 188 | 5,211 | 292,177 | 99,992 | 29,994 |
| 1918 | 161 | 7,014 | 361,226 | 123,087 | 36,349 |
| **Industrial Establishments** | | | | | |
| 1908 | 11,390 | 11,848 | 379,556 | 248,751 | 400,985 |
| 1913 | 15,811 | 20,013 | 916,828 | 375,596 | 540,686 |
| 1918 | 22,391 | 42,436 | 2,006,098 | 646,115 | 763,081 |

It is significant that the number of male workers employed increased in a higher proportion than that of the female workers, showing that the trend of expansion was in the heavier grades of production, such as the iron and steel industries and shipbuilding. A striking advance was also attained in the use of mechanical power in factories, for not only had the number of motors in actual use advanced by 68·9 % and 112 % in the first and second half of the decade respectively, but the actual horse-power developed had increased to the unprecedented extent of 141·5 % and 118·8 % in the same periods. In other words, Japan nearly quadrupled the number

of motors in use, whilst the horse-power developed increased fifty-fold during the decade.

*Shipbuilding.*—In 1896 the Diet passed the Navigation Encouragement Law, and from that time onwards remarkable progress in the shipbuilding industry was made. In 1898 a steamer of 6,000 tons, the first large boat to be built in a Japanese yard, was completed by the Mitsubishi dockyard at Nagasaki for the Nippon Yusen Kaisha. Subsequently the same dockyard and the Kawasaki establishment constructed steamers of over 10,000 tons, as well as cruisers for the Imperial Japanese navy and for China. In 1912 these two dockyards had reached such a pitch of development that each was entrusted with the building of a dreadnought of 27,500 tons.

In 1913 there were six shipyards, with 17 slipways and employing 26,139 workers, and a year later the output of ships of over 1,000 tons gross was 16, the total tonnage being 78,010. In the following five years, owing to the great demand for bottoms to replace the wastage of war, the shipbuilding industry worked with an intensity and vigour which overcame the serious difficulties of lack of skilled workers and of sufficient iron and steel material. Table 12 is eloquent of the results achieved.

Table 12.—Shipbuilding

| | End of 1913 | March 1918 |
|---|---|---|
| Number of shipyards | 6 | 57 |
| | Yen | Yen |
| Nominal capital | 25,550,000 | 163,050,000 |
| Paid-up capital | 23,150,000 | 109,542,000 |
| Debentures | 3,600,000 | 22,050,000 |
| Number of slipways | 17 | 157 |
| Number of workers | 26,139 | 97,355 |

The tonnage built at the leading dockyards in Japan during the four years ending in 1918 is shown in Table 13.

Table 13.—Tonnage built in 1914–8

| Dockyard | No. of Steamers | Gross Tons |
|---|---|---|
| Kawasaki | 49 | 289,083 |
| Mitsubishi (Nagasaki) | 27 | 160,161 |
| Osaka Ironworks (Osaka) | 40 | 133,927 |
| Uraga | 24 | 99,086 |
| Osaka Ironworks (Innoshima) | 24 | 97,021 |
| Asano | 12 | 65,329 |
| Ishikawajima | 14 | 31,005 |
| Mitsubishi (Kobe) | 10 | 29,312 |
| Harima | 10 | 22,953 |
| Fujinagata | 10 | 20,249 |
| Yokohama | 6 | 13,124 |
| Ono Ironworks | 7 | 11,557 |
| Total | 233 | 972,807 |

With regard to her steam merchant fleet, Japan advanced during June 1914 to June 1920 from sixth to third position among the world Powers, since at the latter date she possessed 2,996,000 tons as against 1,708,000 tons in 1914, thus emerging after the war with an increase of 1,288,000 gross tons. Japan also established a world record in shipbuilding speed during the war. On Oct. 7 1918 at 7 a.m. the keel was laid in the Kawasaki shipyard at Kobe of the "Raifuku Maru," a steamer of 9,000 tons dead weight, length 385 ft., breadth 51 ft., moulded depth 28 ft. At 6 a.m. on Oct. 30 1918, or only 23 days later, the vessel was successfully launched, and later achieved a mean speed of 17·39 knots on two trial runs of 3 m. each.

The principal shipyards in Japan are as follows: The Mitsubishi Dockyard, Nagasaki, is the oldest and most important dockyard in Japan with up-to-date equipment. It has a water-frontage of about 1½ m. and is nearly 115 ac. in extent. This yard also possesses its own power station with turbo-generators developing 2,000 kw., as the chief machines, machine tools, shop and wharf cranes are all electrically driven. About 10,000 hands are employed and the firm holds the licence for building Parsons turbines. The Kawasaki Dockyards cover about 40 ac. of land, with a water-frontage of about 1 mile. Although formerly only medium-sized steamers and torpedo craft were built here, the capacity is now sufficient for any vessel up to 27,000 tons. At Hyogo the same company has a steel foundry, with a 20-ton Siemens furnace, producing very fine steel castings. The firm has also secured Italian patents for submarine construction and for motors. The Osaka Ironworks, founded in 1880 by the late Mr. E. H. Hunter, was converted into a joint-stock company in 1914, and now consists of separate engineering, shipyard and repairing departments, with a branch at Innoshima, on the Inland Sea. The shipyard covers nearly 16 ac., with a water-frontage of over 1,000 feet. The firm formerly specialised in the construction of dredgers, shallow-draught steamers, trawlers, etc., but now builds passenger and cargo boats up to 10,000 tons. The annual capacity of the yards is 200,000 tons, and the firm has specialized in the Isherwood type of vessel, having purchased the patent. The Asano Dockyard at Tsurumi, near Tokyo, was started to meet the war emergency and has a number of slips for ships of 12,000 tons. Its yearly capacity is almost equal to the pre-war total of the Japanese dockyards. The Suzuki Dockyard comprises the Harima and Toda yards, which were purchased by the Suzuki Co. of Kobe. When completely reorganized, the capacity of the former will be five vessels of 5,000 tons, and of the latter two of 3,000 and one of 2,000 tons. The Ishikawajima Dockyard at Tokyo has been reorganized to build ships of 6,000 tons. The Uraga Dockyard has a capacity of six vessels; between 5,000 and 10,000 tons. It should also be mentioned that the Yokohama Dockyard, which formerly confined itself to repairs, has now started building. Two other yards, of considerable size, are the Asahi, under the firm of Masudaya, Yokohama, and the Uchida yard, owned by Messrs. S. Uchida of Kobe.

*Raw Silk and Silk-Weaving.*—The manual dexterity peculiar to Japanese women is a factor which ensures the lasting prosperity of Japan's raw-silk industry, and when full advantage has been taken in modernizing the various processes of production in silk filiatures, enhanced benefit should accrue. Japanese silk goods have made great progress, and particularly silk pongee, which has now practically driven the Chinese product from the markets of the United States. At the end of 1918 there were 3,848 factories engaged in the silk industry, employing 64,188 male and 430,110 female operatives.

*Cotton-Spinning, Cotton Textiles and Knitted Goods.*—In spite of the difficulties during the World War of importing from Great Britain and the United States sufficient machinery to meet the enhanced demand for cotton yarn, the spinning-mills of Japan prospered exceedingly. The paid-up capital invested in the mills at the end of June 1920 was 248,180,000 yen, equivalent to an increase of 288% over the pre-war figure, whilst the number of spindles in use in 1918 was 3,384,800, and in June 1920 3,689,000, compared with 2,409,900 in 1914. At the end of 1918 there were 6,710 factories, with 65,316 male and 218,041 female operatives, the total number of workers in the textile industries being therefore 777,655. The latter figure includes about 25,000 who are engaged in the production of knitted goods, consisting principally of gloves, stockings and underwear, in which a large trade, chiefly with British India, has grown up in the last few years. As knitting was formerly entirely a domestic industry, there have been difficulties in producing goods of uniform quality for export, and a system of inspection was therefore instituted towards the end of 1917, under which it was prohibited to export articles of inferior quality. Previous to the war, the average output of knitted goods was 6,660,000 doz., valued at 8,937,000 yen, but during the five years of the war the output averaged 15,143,000 doz., of a value of 23,073,000 yen.

*Iron-foundries.*—Before the war there were only some 20 iron-foundries in Japan, but the difficulties during the war in obtaining from abroad the large quantities of iron and steel required to meet the boom in industry resulted in the establishment of over 250 foundries before the close of 1919. In 1914 the output of pig-iron amounted to 302,000 tons and of steel materials to 283,000 tons. In spite of the slump in the iron industry which occurred after the Armistice, in the year 1919 613,000 tons of pig-iron and 553,000 tons of steel materials were produced.

*Machine- and Tool-Making.*—At the end of 1918 about 2,700 factories were engaged in various forms of machine making; and also in many branches of metalwork and metalware. The manufacture of machinery for the production of electric apparatus and lamps, as well as the construction of dynamos, telephones, railway signals and measuring instruments, are practically new growths of iron and steel industrial activity. Table 14 shows the position of four representative concerns engaged in machine construction in the second half of 1918.

Table 14.—Machine Construction Firms 1918

| | Paid-up capital (1,000 yen) | Receipts (1,000 yen) | Expenditure (1,000 yen) | Dividend |
|---|---|---|---|---|
| Shibaura Engineering Works | 5,000 | 17,401 | 3,208 | 35·0% |
| Nigata Ironworks | 1,818 | 3,224 | 2,842 | 22·0% |
| Tokyo Electric Co. | 6,000 | 6,664 | 5,943 | 20·0% |
| Osaka Ironworks | 10,500 | 10,095 | 4,398 | 35·0% |

*Dyestuffs.*—The manufacture of dyestuffs was an untried industry in Japan prior to the war, and in 1913 no less than 6,000 tons of dyestuffs, valued at 8,000,000 yen, were imported for use in the cotton and silk industries. After the outbreak of the war the cessation of foreign supplies, chiefly derived from Germany, compelled Japan to make an effort to become, to some extent, self-supporting. In 1915 certain dyes were produced, the largest quantity being sulphuric black, then alizarin, acid blue and aniline salt. These were followed by yellow, red, and blue acid, yellow and red direct, and purple, blue and brown basic colours. Early in 1916 the Japanese Government started and subsidised the Japan Dyestuff Manufacturing Co., which later succeeded in producing an artificial indigo, though only on a laboratory scale. By the end of 1918 nearly 100 factories, with a paid-up capital of 14,000,000 yen, had come into existence, and the annual output, including some 80 varieties of dyestuffs, reached 5,400 tons.

*Chemicals.*—The manufacture of chemicals in Japan does not owe its inception to the war, but its great development and the many innovations introduced were the direct result of war-time conditions. There was, however, a sharp decline in the prosperity of the chemical industry immediately after the Armistice. In 1916 the Japanese Government set up a subsidized company for the production of glycerine, entitled the Glycerine Industry Co., and, as the result of extensive investigations at the Industrial Institute into the qualities of sea-weeds and vegetable ash, the production of basic chloridised alkali increased from 2,000 tons in 1913 to 10,000 tons in 1917. The match industry, which formerly derived chlorate of potash from European sources, by the end of 1917 was able to depend on the home supply. In that year there were over 50 factories in existence, producing 10,000 tons of chlorate of potash, which in quality compared favourably with the imported article.

The soda industry, although it existed as long ago as 1880, did not reach a high standard of technical perfection before the war and also failed to satisfy the total annual requirements in caustic soda, amounting to about 25,000 tons. During the war, however, the number of factories increased to about 20, and the annual production rose to 14,000 tons in 1918 and 20,000 tons in the following year.

Some of the chief products in the chemical industry are: sulphuric, hydrochloric and nitric acids, sodium sulphate, carbonate of soda, caustic soda, iodine, potassium iodine, potassium chlorate and chloride, ammonium sulphate, acetic acid, acetone and wood spirit. Table 15 indicates the growth of the industry.

Table 15.—Chemical Industry

| Year | No. of Factories | Employees | | Value of Products Yen |
|---|---|---|---|---|
| | | Male | Female | |
| 1908 | 36 | 1,605 | 52 | 2,740,441 |
| 1909 | 143 | 1,902 | 159 | 4,356,718 |
| 1910 | 218 | 2,436 | 168 | 4,890,043 |
| 1911 | 230 | 2,570 | 223 | 6,406,024 |
| 1912 | 237 | 2,449 | 212 | 5,646,356 |
| 1913 | 341 | 3,089 | 276 | 7,687,232 |
| 1914 | 402 | 3,048 | 134 | 7,583,782 |
| 1915 | 468 | 4,708 | 407 | 16,717,143 |
| 1916 | 717 | 9,422 | 883 | 37,848,244 |
| 1917 | 832 | 12,435 | 900 | 42,494,620 |
| 1918 | 841 | 12,781 | 1,026 | 47,399,696 |

*Agriculture.*—The movement of the agrarian population towards the cities, a familiar phenomenon in most European countries, found its counterpart in Japan during 1910–20. The increase in pop. was about 7,000,000, or roughly 14%, so that it might reasonably have been expected that a corresponding increase would take place in the number of persons engaged in agriculture. The figures, however, show the reverse, as in 1908 there were 5,408,363 persons and in 1918 5,476,784 in the category in question, the increase being only 1¼%. During 1916 and 1917, when Japan was putting forth her greatest effort in producing munitions of war for the Allies, the number of those actually holding land decreased to the extent of 20,800 and 36,400 respectively, whilst in 1918, when the war boom in industry was practically over, the gain to agriculture was only 20,200 persons.

The relative proportion of farmers cultivating their own land, tenant farmers, and farmers combining tenantship with cultivation, showed little variation in the decade, as is shown by Table 16.

Table 16.—Farmers and Tenant Farmers

| | Farmers cultivating own land | Tenant farmers | Farmers combining tenantship |
|---|---|---|---|
| 1908 | 33·27% | 27·58% | 39·15% |
| 1918 | 30·98% | 28·31% | 40·71% |

The high proportion of small holders in Japan is characteristic of the agricultural life of the country. Table 17 shows that the variation in this proportion has remained practically negligible.

Table 17.—Percentage Proportion of Land Holders

| | Under 1·23 ac. | Over 1·23 ac. | Over 2·45 ac. | Over 4·90 ac. | Over 7·35 ac. | Over 12·25 ac. |
|---|---|---|---|---|---|---|
| 1908 | 37·28 | 32·61 | 19·51 | 6·44 | 3·01 | 1·15 |
| 1918 | 35·54 | 33·30 | 20·70 | 6·33 | 2·82 | 1·31 |

Rice still remains the staple food of the country, and the area under cultivation is nearly twice that devoted to the production of barley, rye and wheat. Intensive cultivation of all crops is carried out, and the limit of return has actually been reached in some cases. In the decade from 1908 to 1918 an additional 418,515 ac. were under rice cultivation, and the yield per acre only fell fractionally from 36·42 to 36·34 bushels. In barley and rye the cultivated area showed a slight drop, but in wheat there was an increase of 242,376 ac., the yield per acre showing an increase in all three cases. Little progress as far as yield is concerned was obtained with millet, the area under cultivation also decreasing. The production of potatoes was practically doubled during the decade, although the yield per acre was not so satisfactory.

Cotton, hemp and indigo were all retrogressive, the cotton chiefly owing to the large imports of cheaper cotton from abroad. Table 18 shows the acreage of the chief food products under cultivation at the beginning and end of the decade, and also the position with regard to certain special crops.

Table 19 shows, by index-numbers based on the year 1912, the rise in prices of commodities in Japan between 1912 and 1919.

Table 18.—Principal Crops

| | Area in Acres | | Production | |
|---|---|---|---|---|
| | 1908 | 1918 | 1908 | 1918 |
| | | | Bus. | Bus. |
| Rice | 7,159,850 | 7,578,365 | 259,669,465 | 273,495,435 |
| Barley | 1,578,203 | 1,308,983* | 47,219,585 | 49,175,375 |
| Rye | 1,687,213 | 1,583,586* | 37,893,020 | 38,103,475 |
| Wheat | 1,101,467 | 1,343,843* | 22,062,225 | 31,804,235 |
| Millet | 719,178 | 560,981 | 17,141,625 | 14,514,970 |
| Beans | 1,659,682 | 1,456,975 | 27,378,725 | 25,112,525 |
| Buckwheat | 405,579 | 333,966 | 6,170,890 | 4,261,825 |
| Rape-seed | 359,738 | 284,936 | 6,096,350 | 4,284,400 |
| | | | Tons | Tons |
| Potatoes | 148,705 | 323,621 | 567,055 | 1,195,315 |
| Sweet Potatoes | 745,799 | 754,223 | 3,556,229 | 3,388,664 |
| Cotton | 12,934 | 6,197 | 4,120 | 2,513 |

*Railways.*—The first railway line in Japan was opened to traffic in 1872, subsequent developments of the railways being chiefly in the hands of private companies. In March 1906 the Railway Nationalization Law was enacted, and in the next two years the Government gradually assumed control of some 17 of the leading railway companies. On the completion of nationalization, the Government possessed 4,371 m. of railway, representing a capital of 700,000,000 yen. By the end of 1917 the process of absorption was practically complete.

The decade 1910–20 witnessed an increase of over 31% in the mileage of the State railway system (from 4,624 m. to 6,073 m.), and in the same period the number of passengers carried was more than double (from 128 millions to 288 millions). A marked advance in receipts was seen in the years 1917–9, partly owing to increased fares and partly to the large number of additional passengers carried under war conditions.

*Tramways.*—The number of electric tramway undertakings, both owned by municipalities and by private companies, showed a remarkable increase in the decade, from 34 in 1910 to 74 in 1919. The mileage rose from 367 to 1,059; and passengers carried from 328 millions to 1,225 millions. Further progress should be seen when it is possible to realise some tentative schemes which were being discussed in 1921 for utilizing hydro-electric power to a greater extent. Japan is well endowed by nature with waterfalls, many of which have already been harnessed.

*Posts.*—The postal service of Japan has developed steadily, both in extent and efficiency, since 1908. There are three grades of post-office, known as first, second and third class: the first class is confined to the larger cities, such as Tokyo and Osaka, and these offices not only act as supervising offices for those of lower category, but also control maritime affairs in their respective districts. The

great majority of the post-offices belong to the third grade, and are conducted on a contract system, which has proved eminently satisfactory. The post-offices in Japan include in their operations such diverse matters as the carrying, within limits as to size and weight, of every kind of freight, the collection of taxes and bills, the distribution of advertisements, and the paying of pensions and annuities on behalf of the national Treasury. The post-offices also undertake the business of State life insurance by a simplified process for the benefit of the middle and working classes. Table 20 shows the expansion of the postal services, the figures being compiled in each case to the end of the respective fiscal years (March 31).

Table 20.—Postal Service

| End of Fiscal Year | Number of Post-Offices | Number of Packets | Number of Parcels |
|---|---|---|---|
| 1910 . . . | 6,946 | 1,464,557,721 | 20,281,823 |
| 1911 . . . | 7,086 | 1,512,029,475 | 22,210,422 |
| 1912 . . . | 7,166 | 1,634,423,611 | 23,178,936 |
| 1913 . . . | 7,268 | 1,635,151,146 | 24,393,232 |
| 1914 . . . | 7,268 | 1,798,716,674 | 25,370,165 |
| 1915 . . . | 7,266 | 1,801,092,286 | 25,202,220 |
| 1916 . . . | 7,358 | 1,888,002,293 | 26,128,093 |
| 1917 . . . | 7,530 | 2,043,601,963 | 29,578,542 |
| 1918 . . . | 7,647 | 2,362,802,401 | 33,243,648 |
